THE BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD

APPEALING TO THOSE ENGAGED IN

THE ART OF BUILDING.

IT is our aim, our ambition, our aspiration even, to build our Journal worthily and well, not for the hour only, but for future years; for the few men in the forefront of an enduring and a laborious Art; for the disciplined ranks of a distinguished Profession; for the young men—Architects to be—and for all who love a clustered column or a flying buttress, a traceried window or a Greek frieze; for the man, too, who honestly plumbs a jamb . . . . .

6, GREAT NEW STREET, FETTER LANE,

LONDON.

EYRE & SPOTTISWOODE PRINTERS TO THE KING'S MOST EXCELLENT MAJESTY

CONTENTS.

ACADEMY, Architecture at the, 238.
Acoustics, 97, 208.
Act, Building, of 240 Years Ago, 349.
Acts, Public Health (Amendment) Bill, 271.
Adjoining Owner, Damage by, 13.
Admiralty: Buildings, New, 168; Surveyors, 12.
Agreements, Stamping, 362.
Air-holes in Stanchion, 177.
Alarms, Fire, 50, 70, Fire Supp.
Aldwych, Two new Buildings on, 340–344.
America: Financing Building Schemes in, 358; Fire Losses in, 57, Fire Supp.; Fire-testing Stations in, 46, Fire Supp.
American: Concrete Floors. 336; Warehouses, 90, Fire Supp.; Plumbing, 265; Gold Medal, 121; Society of Building Commissioners, 42, Fire Supp.; Architectural Journals. 136.
Ancient Lights, 35, 54, 132.
Antiquities, Preserving London, 353.
Antwerp, Entrepôt Royal, 38, Fire Supp.
Arbitration Case, 307.
Arches and Vaults. 136.
Architect, Lady, 193.
Architects: Society of, 51, 99, 285, 294; Royal Institute of British, 27, 49, 72, 103, 143, 156, 180, 205, 252, 282, 320, 345; Registration, 55, 57, 285; Lord Grimthorpe and the, 237, 283; Charges, 199, 276; and Public Works, 185; Fees, 177; Assistants in Canada, 253.
Architecture: and Sculpture, 282; Illusions in Mediæval, 349; at the Academy, 238; Garden, 205; with a Pound of Tea, 199; Rectilinear Period, 163; Nonconformist, 19, 54; Orders of, 132; M. Rodin on, 107; London Street, 97; Byzantine, 61.
Architectural: Association, 16, 61, 94, 115, 140, 169, 190, 289; Assistants in the Colonies, 19; Fitment of Ships, 108; Drawing, 88; Lending Library, 107; Training, 107; Papers, American, 136; Education, 103.
Arts and Crafts Exhibition, 306.
Art Schools, French, 7.
Asylum, Napsbury, 314.
Ayr, "Auld Brig," 365.

BACTERIAL TREATMENT OF HOUSE DRAINAGE, 139.
Bakery, Model, 157.
Ballroom on First Floor, 88.
Ballrooms, Temporary, 83; 61, Fire Supp.
Baltimore: Buildings, 78, Fire Supp.; Fire, 52, Fire Supp.
Bathrooms in Cottages, 102, 132.
Bay Windows, 136.
Beam: Concrete Steel, 303; Bending Moment on, 236; Strength of, 236, 294; Fibre Stress in, 218.
Berlin: New, 316; High Steel-framed Buildings in, 137; Theatre "Fire Watch," 45, Fire Supp.
Bird's-eye Views, 113.
Bitumen, 109.
Blackboard, Cheap, 108.
Blashill, Thomas, 64.
Blomfield, Reginald, 64.
"Bloomsbury Gas Explosion," 42, Fire Supp.
Bolsover Castle, Sketching at, 162.
Books: Stair Construction, 66; Essex Churches, 253, 263; House Designs, 276; Examinations, 276; Brickmaking, 132; R.I.B.A. Intermediate, 35; Electric Batteries and Motors, 192; Reinforced Concrete, 136; Building Construction, 332. *See* also "Views and Reviews."
Boston (U.S.A.) Fire-station, 71, Fire Supp.
Brackets, Strength of, 65.
Bremen Fire-station, 85, Fire Supp.
Brickwork: Payment for Additional, 20; Glazed, 66; Reductions in, 308; Pointing, 332.
Bridge: Ayr, 365; Works, Arrol's, 234; Suspension, 113; Contract, 253; Luxemburg, 93, 107; Expansion Bearings for, 12.
British Museum, Addition to, 133.
Builders' Notes, 6, 24, 34, 64, 105, 125, 145, 158, 181, 186, 206, 234, 261, 292, 309, 323, 334, 352.
Building: Schemes in the States, Financing, 358; Act of 240 Years Ago, 349; Construction, Examinations in, 131; Commissioners, American Society of, 42, Fire Supp.; Trade in 1904, 21; Transaction, 362; Acts Amendment, London, 1, 27, 48, 86, 106, 171, 321: 52, 73, 93, Fire Supp.; Trades' Exhibition, 219, 243: 81, Fire Supp.; Trades, Information Bureau for, 164.
Buildings, Live and Dead Loads in, 166, 178.
Bureau, Building Trades' Information, 164.
Buttresses, 55.
By-laws, Rural, 27, 293.
Byzantine Architecture, 61.

CA' CANNY IN THE COUNTRY, 171.
Calls and Alarms, Fire, 50, 70, Fire Supp.
Cantilever, Gallery, 79, 88, 108, 112.
Carpentry and Joinery Exhibition, 339.
Cathedral: Lincoln, 157; St. Paul's, 15; Subsidence at Winchester, 297; Wakefield Extension, 260.
Celluloid Factories. 232.
Cement-making in Scotland, 251.
Cement: Associated Portland Cement Manufacturers' Works, 195; Facing, Colour-wash on, 132; Floors, Colouring, 136; German Industry, 24; in Concrete Floor, 54; Insufficiently Cooled, 88; Rough-cast, 253; Standard Specification for, 29; Portland, 2, 22.
Chapel Allerton, Red House, 323.
Chapels, Cemetery, 162.
Charges, Architects', 177, 199, 253, 276.
Chelsea "Underground" Power Station, 84, 277.
Chicago Theatre, 44, Fire Supp.
Chimney: Stability of Tall, 11; Stack, Design of, 12; Pots and Flues, 19; Octagonal, Roof Surface cut by, 276.
Christchurch Priory, Sketching at, 349.
Churches: Heating, 20; Fittings, 94; St. Mary's, Great Warley. 313; St. Mark's, Venice, 313; St. Bride's, Wentloog, 160; Dalmeny, 134; Tenterden, 332; Norfolk, 293; Book on Essex, 253, 263; Perpendicular, 177, 207; St. Julien-le-Pauvre, Paris, 256; St. Margaret's, Westminster, 336.
Cities, Planning of, 180.
Clerks of Works: 132, 136; Association, 96.
Collar-beam Roof, 307.
Columns: Strength of, 359; 130-ton Granite, 70.
Competitions, 264, 282, 292, 298, 308, 317, 333, 338, 339, 347, 348, 353.
Competition: Reform Society, 48; Rules, 255.
Competitors' Estimates, 327.
Concrete: Structures, Dampness of, 454; American Methods of Paving and Flooring, 336; Staircases, 96, Fire Supp.; Floor and Rolled Joists, 54; Steel Lintel, Strength of, 79, 88; Reinforced, 19, 98, 133: 68, Fire Supp.; Steel Beam, Strength of, 303.
Construction: Slow-combustion, 82, Fire Supp.; Time wasted in Watching, 316.
Consumption among Stonemasons, 211.
Contract: Signing Form of, 12; Alteration in Printed Form of, 87; Assignment of, 88; Alterations in, 207; Drawings, 332.
Contractor and Road Surveyor, 87, 113.
Contractors' Deposits, 183.
Coolgardie Water-supply, 173.
Correspondence: Architects' Fees and Building Estates, by C. F. Fryer, 75; Buttresses, by Max Judge, 75, by E. G. Walker, 102; Cottages with Bathrooms, by W. H. Death, 145; English v. Foreign Granite, by Harry Hems, 145; Hagioscope at Stogumber Church, by R. J. Jenkins, 193; Mr. Bodley's Work at York Minster, by Allen Foxley, 209; Architects and Public Works, by Auld Reekie, 210; Registration, by G. A. T. Middleton, 210; Electric Lifts in Office Premises, by Smith and Stevens, 251; Baryta Treatment of Stonework, by Julius Hülsen & Co., 264; Are Lightning Conductors Dangerous?, by Alfred Hands, 264; Manchester Town Hall, by Paul Waterhouse, 264; R.I.B.A. Council Elections, by Cole A. Adams and "Anti-Stagnation," 279–80; Fibre-stress in Beams, by Henry Adams. 292; Stalls, by Harry Hems, 306, by H. L. North, 337; Worm Holes in Dado, by The Powell Wood-Process Syndicate, Ltd., 306; A Village Chapel, by Thomas W. Mawson, 319; Competition for Primitive Methodist Orphan Homes, Harrogate, by "Harlow Moor," 347.
Cottages: on Building Estate, 54; at Letchworth, 110; with Bathrooms, 102, 132; Exhibition, 158.
Country Houses: Sanitation of, 115; Fires, 55, Fire Supp.
Crouch End Opera-House Fire, 45, Fire Supp.
Crowd, Weight of, 311.
Cycling Tours, 307.

DALMENY CHURCH, 134.
"Dangerous Structure" Trap, 48, Fire Supp.
David Lewis Workmen's Hostel and Club, Liverpool, 30.
Decorative Painting, 156.
Devon and Exeter Architectural Society, 201.

THE
BUILDERS' JOURNAL
AND ARCHITECTURAL RECORD.

January 4, 1905. Vol. 21, No 517.
6, Great New Street, Fetter Lane, E.C.

Summary.

The London Building Acts Amendment Bill has now been printed. (This page.)

Four- and five-room houses have been erected at Saffron Walden at a cost (including ground) of £100 each. (Page 6.)

Work for the unemployed has been found by the Garden City Co., who ask for funds to enable 200 men to be employed for three months. (Page 6.)

Drainage operations in London that will cost £7,000,000 are now in progress or about to be commenced. (Page 13.)

The front of Milan Cathedral is to be reconstructed. (Page 10.)

Rotary kilns for burning Portland cement were tried in this country twenty years ago, though the difficulties presented then seemed insuperable. The process was developed in the United States and eventually perfected by Messrs. Hurry & Seamen, whose patents for Great Britain were recently purchased by the Associated Portland Cement Manufacturers (1900), Ltd. By the rotary process the slurry passes down the kiln and is calcined at the lower end, the hot clinker falling into another revolving cylinder and there cooled. The rotary kilns at the Swanscombe works are 70ft. long and about 6ft. in diameter. (Page 2.)

The rebuilding of St. Mark's Campanile, Venice, is not expected to be completed till 1909. The cost is estimated at £80,000. (Page 10.)

Mr. Rowntree is building a garden city outside York. (Page 10.)

A competition is to be held for a new building for the Mitchell Library, Glasgow. (Page 10.)

A very finely illustrated treatise on English furniture is now being issued in parts. (Page 13.)

£500,000 is proposed to be spent on street improvements in Rome. (Page 10.)

The deaths are announced of Mr. J. T. Wimperis, F.R.I.B.A., and Mr. W. G. Laws, M.I.M.E., M.I.C.E. (Page 9.)

The deputation from the Glasgow School of Art which visited the chief schools of art in France have issued their report. They observe that education is free throughout France, but no student can enter a school of art until he has passed an examination demanding preparatory instruction, which is provided in special preparatory schools. At Glasgow the deputation hope that, with the aid of the continuation classes of the School Board and the establishment of a preparatory school, the thorough preparation of students for the School of Art may be ensured. (Page 7.)

London Building Acts Amendment.

The text of the Bill which is to be introduced into Parliament this session to amend the Acts relating to buildings in London, and to confer various powers on the London County Council, has just been published. On p. 257 of our issue for November 16th last we recounted shortly the history of the Bill and the latest provisions which the L.C.C. Building Act Committee had added. In our issues for February 25th and March 4th, 1903, we published a detailed criticism of the first draft submitted to Parliament and withdrawn on March 4th, 1903, while the criticisms and suggestions of the Royal Institute of British Architects were published in our issue for February 17th, 1904. The Act is proposed to be divided into 16 parts, one more than formerly, the new part being Number VIII. and dealing with "means of escape in case of fire and provisions for reducing risk of fire in buildings." In Part I. there are various amendments of definitions. In Part II., formation and widening of streets, a number of regulations are given which have for their chief object the prevention of blind alleys and streets made simply with the object of cutting up sites for the utmost benefit of building speculators without regard to the main lines of traffic. Part III. deals with the lines of building frontage. There is nothing in this of special note, except that communication bridges between buildings above the level of the street may not be erected without consent, nor show-cases, &c., on forecourts. Part V. deals with open spaces about buildings and the height of buildings. By this the objectionable paragraph in the old Act which stipulates that the space at the rear of a building shall extend the whole width is modified with regard to corner sites, but 15ft. depth at the rear is required instead of 10ft. as hitherto. The ambiguous clause relating to the provision of open spaces or courts in buildings for the purpose of admitting light and air is remedied to a great extent, and provision is made for the proper ventilation of such spaces by an opening at the bottom. By clause 57 no building other than a domestic building can be erected within 12ft. of the open space provided in connection with a domestic building. By clause 59 no building other than a church or chapel shall be erected higher than the distance to the building on the opposite side of the road. In Part VI., construction of buildings, section 63 requires that any external wall facing the public way shall be carried up so as to form a parapet, similar to a party-wall. Such a regulation, however, is most regrettable from an artistic point of view. Another objectionable provision is that the heights of living-rooms shall be 9ft. instead of 8ft. 6ins. as formerly, and 8ft. 6ins. instead of 8ft. where constructed partially in the roof. This practically prevents the erection of cheap cottages for the working classes, and is quite absurd, because a low room economizes warmth, and ventilation is not obtained by increasing cubical contents: 7ft. 6ins. should be the minimum. A number of other regulations are included which are important in their way, but we will pass to the clauses affecting fire protection. All constructional ironwork is to be protected by concrete, brick, terra-cotta or metal lathing and plaster or cement not less than 2ins. thick. Churches, chapels and other public places of assembly are to have panic-doors. Shops are to be separated by party structures of fire-resisting materials. Buildings of a greater height than 50ft., buildings used partly as shops and partly for sleeping accommodation, or buildings giving such accommodation for more than twenty persons (other than in one family) are to be constructed in accordance with any requirements made by the Council for the prevention of the spread of fire. Means of escape in case of fire are to be provided. Cavities are not to be left between boarding or panelling and the walls. Clauses as to lift shafts are to be retrospective after seven years from the commencement of the Act. Means of access are to be provided to the roofs of all buildings over 25ft. in height. We shall return to these clauses later, though we may here observe that they seem eminently fitted to a large city like London. Among other general clauses are those stipulating that stairs shall not have a rise of more than 7½ins. nor a tread of less than 8½ins., clear of nosings, except in the case of winders; that every window 25ft. or more above the ground shall admit of being cleaned from the inside; and that the Council may make regulations with respect to iron or steel skeleton buildings. The Tribunal of Appeal is to have two members added, one appointed by the Council and one a barrister, the latter to act as chairman. The storage of wood and timber is wisely regulated, and the consent of the Council will have to be secured for the erection of sign-boards, frames or other advertisement structures, or cranes, &c., projecting from buildings. Power is also sought to appoint inspectors of building plant, machinery, scaffolding, shoring, &c. On the whole, the Act seems to be well conceived and will not require much modification, though of course it omits to deal with many subjects which architects desire in the interests of good design; these, however, are at present not within the range of practical politics. All contentious points are eliminated as far as possible from the measure, and it is to be hoped the opposition will not cause the Bill to be postponed still further, as there is immediate need for the revision of the existing Building Acts.

PORTLAND CEMENT.*

Some Notes on its Manufacture and Testing.

By H. K. G. BAMBER, Managing Director, The Associated Portland Cement Manufacturers (1900), Ltd.

THE manufacture of Portland cement originated on the Thames in the year 1824, as the outcome of a patent taken by Joseph Aspdin, the name "Portland" being given to the material by reason of its resemblance when set to the well-known building stone quarried at Portland, on the south coast of Dorsetshire. The cement was first made commercially at Swanscombe, Northfleet and Cliffe, at the works of "J. B. White & Brothers," "Robins" and "Francis," all three now forming part of the amalgamated works owned by the Associated Portland Cement Manufacturers (1900), Ltd.

The usefulness of this new material soon became apparent to engineers, architects and others, and it quickly superseded Roman cements and hydraulic limes, the only cementitious materials of this description then in use. Very little was known in the early days of its introduction, and the manufacture was carried out on very crude rule-of-thumb methods. It is only within the last two decades, and more especially in the latter, that any attempt has been made to conduct the manufacture on really scientific and up-to-date mechanical lines.

Until quite recent years

The Literature of the Subject

was of the most meagre description, but since the attempts of the manufacturer to produce cement in a more scientific way the subject has received a great deal more attention, and there are now available many works on the subject by various well-known scientists and experts, headed by the late Mr. John Grant, engineer to the then Metropolitan Board of Works. No doubt these books, describing more or less in detail the manufacture of cement by the older process, are well-known to most users of Portland cement, and no useful purpose will therefore be served by describing at length the older methods with which the various treatises deal.

Shortly,

The Old Process

consisted of mixing together chalk and clay (for many years the only materials used) in definite proportions: a difficult matter when it is remembered that it is only in recent years the assistance of the trained chemist has been utilized to check the composition in the early stages of manufacture, and that formerly this was done entirely by rule-of-thumb—the material frequently reaching the final stages of manufacture before defects were discovered arising from improper proportions of raw materials, which defects it was then practically impossible to remedy.

After mixing, the material was pumped or elevated into "backs," or reservoirs, where settlement could take place and a considerable percentage of the water used for amalgamating the chalk and clay could be removed by decantation and evaporation. (No doubt also one of the principal ideas of these backs was to neutralize, by storing in large quantities, the varying proportions of chalk and clay in the mixed material arising in the absence of proper scientific and chemical supervision, as now adopted in all modern works.) This mixture of chalk and clay was then removed by hand or pumped on to drying floors or chambers over the kilns, where the water remaining therein was evaporated by heat obtained from the process of calcining, to which process in its turn the dried material was subjected. The resulting clinker was then ground to a powder, producing the Portland cement as known to the trade.

For many years the consumer himself, knowing little or nothing of the material he was using, was entirely in the hands of the manufacturers as to the description of cement supplied, and no doubt this monopoly with the manufacturers of what knowledge there was on the subject was the cause of a great national industry, such as the manufacture of Portland cement, remaining for so many years unenlightened and following the unscientific practices of its infancy.

Experiments and Results.

The development of research and the carrying out of properly organized investigations into the manufacture and properties of Portland cement, more especially in Germany and America, compelled the English manufacturer, who had been somewhat tardy in this direction, to set about putting his works in order and remodelling them on scientific lines. The extension of knowledge of the subject soon resulted in other calcareous and silicious materials being experimented with for the manufacture of cement, and in many cases such materials, other than chalk and clay, have been found suitable for the purpose under proper methods of manufacture, with the result that works have sprung up in various parts of the country; but in no case are the materials so eminently adapted for the manufacture of the best quality of Portland cement as the chalk and clay found in the cradle of the industry on the Thames and the Medway.

Another result of the more general knowledge of the subject was the framing by the consumer, or rather by his architect or engineer, of many and various

Specifications,

whereby his intention was to ensure the provision for himself of a cement having certain qualities and peculiarities which conformed to his own ideas of the subject. It can be readily imagined how the difficulties of the manufacturers with their great *clientèle* have in this way been increased during the last decade. Many consumers have asked for cement of their own particular fancy, in some cases stipulating certain conditions in one clause made absolutely impossible by the requirements of the next, and with these the manufacturer has in some way to comply to give satisfaction to his customers. Fortunately for the manufacturer, this matter is now having the attention of the cement section of the Engineering Standards Committee, of which the writer is a member, and it is hoped that as a result of their deliberations a standard specification of the quality of cement, together with details as to the methods to be employed for testing the same, will be shortly compiled and published, to the mutual advantage of the consumer and the manufacturer.

As the principal object of this short paper is to bring to your notice the correct methods for practically testing cement on works, the various processes of the more modern manufacture will be shortly described, so that, in dealing with the question of testing, it will be possible to trace back to each particular process of manufacture the conditions which are, and must be, applied by the manufacturer to obtain a finished product which shall possess those qualities which will enable it to successfully pass the various tests required of it, and which will later have our consideration.

The Raw Materials,

chalk and clay, as used on the Thames and Medway, are of excellent description, the white chalk being practically pure and containing from 98 to 99 per cent. carbonate of lime with slight traces of silicates of alumina and oxide of iron. As quarried, it contains an average of 15 to 20 per cent. of water, depending largely on the depth of the pit. On the Thames this white chalk is exclusively used, the grey or lower chalk being found underlying the white chalk in the hills bounding the valley of the Medway.

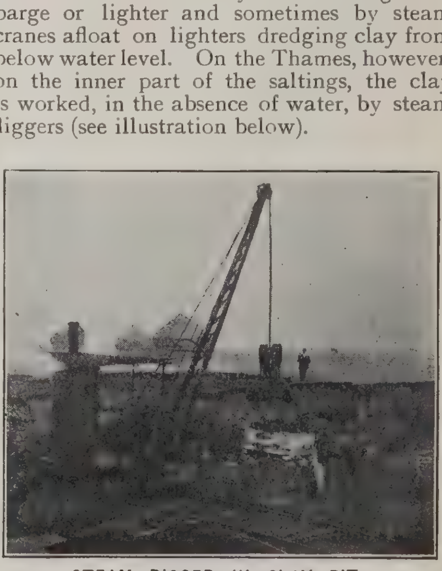
Quarrying.

Owing to the great depth of the quarry faces, about 80ft. to 100ft., no mechanical means can be employed for excavating the chalk, the same being quarried by manual labour directly into trucks for conveyance to the works. Great care is taken to remove from above the chalk all "callow," *i.e.*, gravel, loam, sand and hard contaminated chalk, locally known as "bull head," so that none but the pure chalk is used for the manufacture. To the archæologist this part of the work is full of interest, as, owing to the large area of ground being excavated annually, including the production of clay for brickmaking, articles of great antiquity and interest are continually being found. As the supplies of chalk immediately contiguous to the works have long since been worked out, it has been necessary to go further inland for material, necessitating steam or other traction to bring the raw material to the works.

GENERAL VIEW OF CHALK QUARRY.

On the Medway some white chalk is used, but in the upper reaches at the Associated Portland-cement works at Burham and Halling the lower or grey chalk is the chief source of supply. At the former works also gault clay, which crops up at this point, is used in place of the alluvial clays. The grey chalk differs somewhat in composition from the white, having mixed with it by nature a quantity of silicates of alumina, or in other words clay to the extent of about 10 per cent., the percentage of carbonate of lime ranging about 90.

The greater quantity of clay is obtained from the alluvial deposits known as "saltings" in the estuary of the Thames and Medway. On the latter, the material is obtained sometimes by hand-filling into barge or lighter and sometimes by steam cranes afloat on lighters dredging clay from below water level. On the Thames, however, on the inner part of the saltings, the clay is worked, in the absence of water, by steam diggers (see illustration below).



STEAM DIGGER IN CLAY PIT.

---

* A paper read before the Clerks of Works' Association of Great Britain, at Carpenters' Hall, on September 12th, 1904.

WASHMILLS.

Mixture of Chalk and Clay.

The chalk and clay obtained by excavation are brought into the works and there carefully mixed by means of powerful machinery in fixed and definite proportions, in accordance with the requirements of the specification under which it is intended the cement manufactured therefrom is to be supplied.

The principal object of this part of the process is first to get the materials mixed in exactly the proper proportion, and this is done by the most careful and continuous system of sampling and analysis while the mixing is going on. Samples are taken every fifteen minutes, and so regular is the composition of the chalk and clay used that the chemists in charge of the various plants, working under a properly organized system, have no difficulty, by means of chemical tests, in keeping the proportions well within the prescribed limits.

Chemical Method Adopted.

The method adopted is to determine the amount of carbonic anhydride (CO_2) present in an accurately weighed amount of the dried mixture of chalk and clay. Chalk ($CaO.CO_2$) consists of 56 parts calcium oxide (CaO) chemically combined with 44 parts of carbonic anhydride (CO_2), and it can only occur in these fixed and definite proportions. By taking, therefore, an accurately weighed quantity of dried "slurry," and determining by means of proper apparatus the amount of CO_2 present, which can be done with great accuracy and rapidity, the amount of calcium carbonate present in the mixture can be immediately calculated. In addition to this, the precaution is taken of igniting another weighed quantity of the same dried sample and determining the loss of weight, which latter consists of all the carbonic anhydride (CO_2) and also any organic peaty matter that may have been introduced with the clay. By means of these two tests, carried out by thoroughly skilled chemists, the exact amount of calcium carbonate in the mixture is accurately determined; and seeing that both operations can be conducted and finished in a comparatively short space of time, a thorough knowledge of the composition is always available to the chemist, who makes the slight alterations in the proportion of materials whenever his tests show that such alterations are necessary. In this way the manufacturer nowadays, with the aid of chemistry, keeps his mixture exactly as required for the particular purposes.

Having ensured this, the next important step is to see that the materials are thoroughly amalgamated, in order that when later they are submitted to calcination the atoms going to make up same may be in the closest possible juxtaposition and in the smallest possible atoms. The chemical combination of the raw materials when submitted to the necessary process of calcination is very much more perfect than when the particles are appreciably larger and not intimately mixed; in fact, the combination of the silica and alumina of the clay with the lime (after the elimination of the carbonic anhydride from the chalk) can never properly take place unless the materials to be calcined are in the finest possible state of sub-division.

CLAY BEING TIPPED INTO WASHMILLS.

In the modern cement plants so perfectly is this part of the operation carried out that at least 96 per cent. of the chalk and clay delivered to the mixing and grinding mills is capable of passing through a sieve having 32,400 holes per square inch before it is delivered by the mill for conveyance to the storage mixers.

Some of the Associated Company's mills are capable of preparing the materials from the raw state to the fineness described at the rate of 50 tons per hour, the whole of this operation—as indeed the whole process—being under the direct supervision of the works' chemists.

Comparative Wire Screens.

Having brought the raw materials up to this point with a known composition, fineness and fluidity, the mixture of same—technically known as "slurry"—is pumped into large storage reservoirs, each having a capacity of slurry sufficient to make 600 tons of cement. In this way a more perfect mixture is secured, as the slightest variation experienced in the washmills is corrected again at this point by mixing in large bulk.

The mixers in use at the Associated Company's works effect a very great improvement in the quality of the product by the thorough system of incorporation, previous to the process of calcination, which immediately follows; the slurry in the mixers not being withdrawn until certified by the work's chemist that it is in every respect in accordance with requirements.

We now come to

The Second Part of the Process,

which is entirely of a chemical character—the process preceding it being purely mechanical. More attention, perhaps, has been given to improvement of this part of the process than to any other. Many forms and descriptions of kilns have been tried, but as they all necessitated very heavy charges for labour, and the fuel used was essentially coke—a relatively costly fuel, and one liable to unexpected and artificial fluctuations in price—they have not met with much economical success.

Among the most economical of these kilns is the Hoffman (which can be used only in cases where cement is made by the dry process).

Hoffman Kiln.

In this kiln coal only is used, with great economy in the quantity consumed as compared with the more ancient chamber kilns, but the amount of labour in charging and drawing the chambers is very excessive. Partly owing to this reason and to the fact that the wet process is more universally adopted in England, this kiln has not met with much success in this country.

Other types of continuous kiln are those known as the

Schneider and Shaft Kiln.

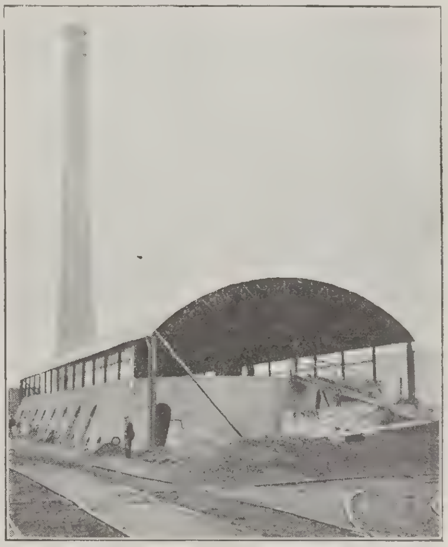
These consist of a vertical cylindrical shaft, with openings at the bottom for removing the burned clinker. The raw material and the fuel are fed in at the top of the kiln, as the materials fall therein, when the clinker is drawn from the bottom end.

This kiln is also very economical in fuel, but this advantage again is partly lost by the heavy labour bill entailed.

The Schoffer, Stein and Deitch kilns are also of this vertical shaft type, but have met with little favour in this country.

Dry Material fed in with Fuel.

With all these vertical continuous kilns it is essential that dry material shall be provided to be fed in with the fuel. There is no waste heat therefrom, consequent on the low consumption in the kiln, with which the wet raw material can be dried, the latter having to be dried by some auxiliary means, the cost of which both for labour and fuel has to be added for comparison with the working of the chamber kilns, which dry their own material with escaping heat from the previous charge, as already described.



HOFFMAN KILN, BURHAM WORKS.

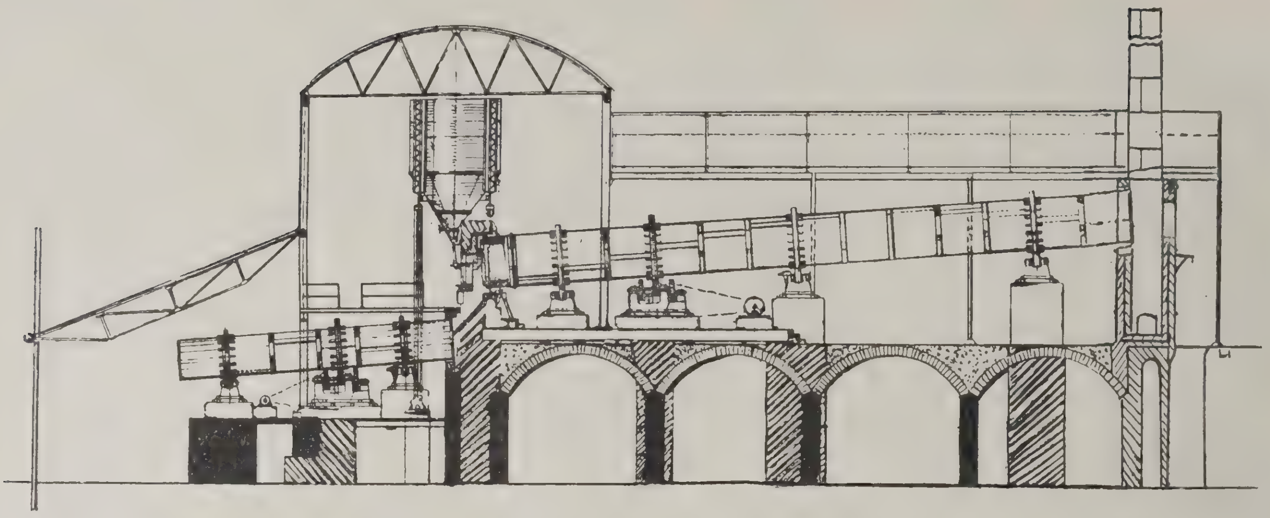
With all these kilns the operator has little or no control of the temperature at the part of the kiln where calcination is going on; and burned, as it must necessarily be, in fairly large pieces, so that the draught of the kiln is not impaired, a considerable portion of the product gets over-burned on the surface, leaving frequently a core of "half-burn," which it is difficult to remove and has a tendency to cause unsoundness in the finished cement.

The process of burning with

Rotary Kilns

was tried at two of the Associated Company's works as far back as 1885—the process patented by Mr. Frederick Ransome, A.M.I.C.E. Although a measure of success was obtained at these early trials, many difficulties presented themselves which at that time appeared to be insuperable. The use of pulverized coal had not come into practice at that time, and great difficulties were experienced in burning with producer gas. No satisfactory material could be found for lining the hottest part of the kiln, and owing to the shortness of the kiln—being only about 25ft. in length—no economical use of fuel could be obtained.

The ideas originated in the Ransome process were, however, developed in the United States, where the use of petroleum as fuel



SECTION OF ROTARY KILN PLANT, ARLESEY WORKS.

removed a great many of the early difficulties experienced in the experiments in England. The process was eventually brought to perfection by Messrs. Hurry & Seamen, whose patents for Great Britain were recently purchased by the Associated Portland Cement Company. The process developed very rapidly in America, and the rotary kiln is in almost all works in that country adopted for the calcination of Portland cement; the Atlas Works there, which own the Hurry & Seamen patents in that country, being by far the largest and most important works producing Portland cement of the best brands.

By the Rotary Process

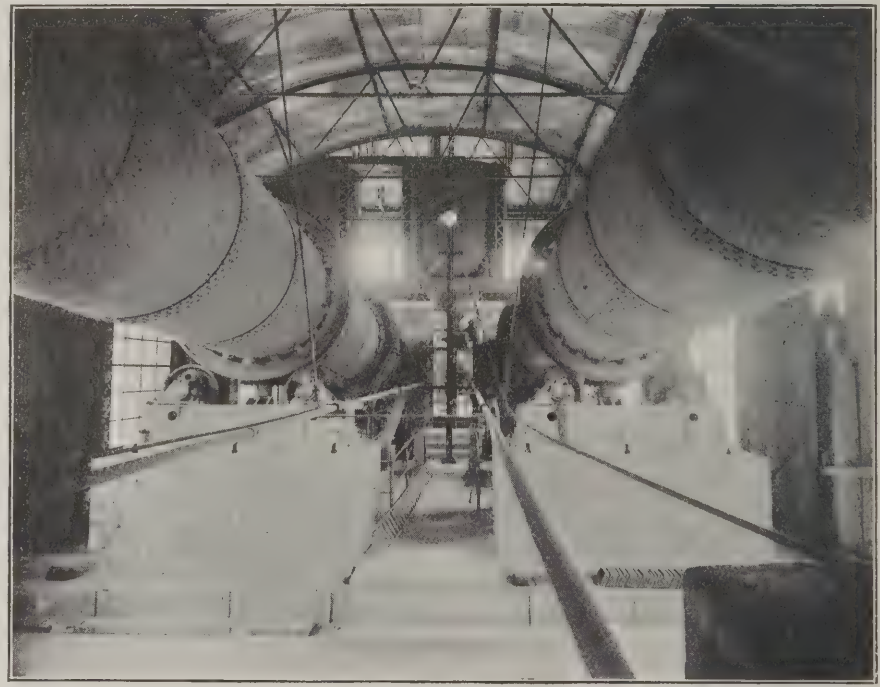
the prepared slurry—instead of being dried on "ovens" and "chamber kiln floors" with heat from the intermittent (old method) kilns, from which it had eventually to be removed when dry and packed with coke into these kilns at great expense for labour—is pumped from the mixers already described in a thoroughly homogeneous condition into the rotary kiln, down which it passes as the kiln rotates, the water being driven therefrom by the heat from the escaping gases evolved at the lower or calcining end of the kiln where a temperature of from 2,800 degs. to 3,000 degs. Fahr. is continually maintained.

The kilns are, in some cases, as at the Swanscombe works, 70ft. long, and in more recent practice, as at the Arlesey and Northfleet Works of the Associated Cement Company, 80ft. long and 6ft. in diameter. The power for rotating the kilns is obtained by means of electric motors, and the variations of speeds of rotation, necessitated by continual atmospheric changes, are entirely under the control of the operators in charge of the several units. It will be readily understood that nothing but the finest material and workmanship is possible in the construction of kilns of such length revolving on friction rollers carrying such great weights and subject to such varying conditions of temperature.

The Temperature necessary

for calcination at the lower end of the kiln is obtained from the combustion of pulverized bituminous coal, which is forced into the kiln by means of an air-blast, or other means,

VIEW OF VECTIS WORKS, ISLE OF WIGHT.



ROTARY KILNS AT ARLESEY WORKS.

where it immediately ignites. The supply of coal in regular quantities as required is provided by methods covered by the Hurry and Seamen patents, owned by the Associated Portland Cement Co., and the economy and efficiency of the process and the regularity in the qualities of the finished product depend largely upon the successful working of the machinery of this portion of the plant, which under the patent processes covered by Hurry and Seamen are entirely accomplished.

The slurry is pumped from the mixers, as already described, into the top end of the kiln, through which it gradually descends, first losing its water by evaporation in its passage down 20ft. of the kiln; it then reaches a temperature where all organic matter from the clay and carbonic anhydride (CO_2) is evolved, and descending further, and when within 20ft. of the lower end of the kiln, it reaches a zone of temperature ranging between 2,800 degs. and 3,000 degs. Fahr., when the chemical combination of the lime with the silicates of alumina takes place, producing

Portland-cement "Clinker."

The hot clinker falls from the end of the kiln into a somewhat similar cylinder, but of slightly smaller dimensions. During its passage though this second revolving cylinder, or "cooler," the heat brought over with the clinker is withdrawn by the passage of cold air through the tube, which becomes heated, and is eventually carried upwards by the induced draught of the kiln chimney into the kiln, where it assists combustion.

The rotary kiln produces clinker in appearance quite of a different character to that of the intermittent chamber or continuous shaft kiln. The raw material in its passage down the rotary kiln, as previously described, breaks up into small particles during the process of dehydration and decarbonization, and presents itself at the clinkering zone in very small particles, so that in its passage through this zone of fire the small particles are thoroughly and completely calcined to the centre, leaving no core of half-burnt raw material, as is frequently the case with the older methods of calcination in large pieces. This perfect calcination is the primary cause of the soundness of cement produced by this rotary process. The amount of fuel used, and therefore the temperature produced, is entirely under the control of the person operating the kiln, and by means of special apparatus provided under the Associated Company's patents he can reduce or increase at will, by altering the speed of rotation of the kiln, the amount of raw material coming towards the firing zone,

GENERAL VIEW OF ROTARY PLANT, SWANSCOMBE.

and also the amount of pulverized coal injected. By means of a pyrometer, or more often by long experience, the operator can gauge the exact point of temperature for the most economical production of a perfect cement clinker, which, being produced under most regular and continuous conditions of temperature, results in a thoroughly uniform product, owing to the complete chemical combination of the silicates of alumina and lime.

An Important Improvement

brought about by the rotary process is the elimination of the ash from the fuel from the cement clinker. In the older processes the ash from the coke and coal used for calcination must necessarily remain intermixed with the clinker in the kiln, from which it cannot be removed, whereas in the rotary process the fine ash derived from the coal is carried away out of the kiln and does not contaminate the clinker.

The Third and Final Process of Manufacture

is, like the first, entirely of a mechanical nature. The clinker, as produced by calcination in small pieces, is an absolutely inert material, and no chemical combination with water can take place until the clinker has been reduced by some mechanical means to the condition of a fine powder. This is a very important feature in the manufacture, as it is well known that the chemical action of the cement when subsequently gauged with water is in direct proportion with the fineness of the particles: the smaller the particles the greater the chemical activity, and therefore the cementitious value as a material of construction. For this reason the high-class finely-ground cements on the market are frequently much more economical in use owing to increased covering power, notwithstanding the higher price which is demanded for these high-grade cements.

SLURRY FEED ENDS OF ROTARY KILNS, SWANSCOMBE WORKS.

Crushing.

The reduction to powder of the cement clinker is obtained by means of several classes of machinery, all of a heavy and powerful kind, necessitated by the extreme hardness and refractory character of the material to be pulverized.

The method employed for many years, but now practically obsolete, was the reduction first by crushing in some form of stone-breaker, and finally by grinding through French burr millstones. This system, although very effective in times past, when a comparatively coarse ground cement was asked for, is much too costly in labour, power and repairs now that coarsely-ground cement has become almost a thing of the past.

Ball and Tube Mills.

The millstone has been superseded by many kinds of more modern machinery, such as mills of the vertical and horizontal edge runner type, but the class of machinery now found most economical and effective for very fine grinding is represented by the revolving tube system containing steel balls and flint pebbles, the mill containing the steel balls being described as the "Ball Mill" and the latter with pebbles as the "Tube Mill." The Ball Mill, as the preparatory grinder, consists of a revolving cylindrical chamber, the circumferential ends being set at an angle to the circumference, forming a series of steps as the mill revolves. The steel plates forming these ends are perforated, and as the mill revolves with a charge of 2 to 3 tons of steel balls rolling on the bottom and falling from step to step, the cement introduced is crushed by the falling and rolling action of the balls to a coarse powder, in which condition it passes through the perforations in the plates and falls on to a series of sieves: that fine enough to pass through these sieves constitutes the output of the mill: the coarser particles rejected by the sieves returning automatically beneath the steps as the mill rotates into the interior of the mill for further reduction.

The material from this mill is then introduced into a finishing mill or tube mill, a plain revolving cylinder about 26ft. long and 5ft. diameter carrying a charge of round stone flint pebbles sufficient to about half fill the mill. As this mill revolves the cement (in a coarsely ground state as delivered from the ball mill) is crushed between the large mass of rolling stones, and finally leaves the mill after passing from one end to

COOLERS AT SWANSCOMBE WORKS.

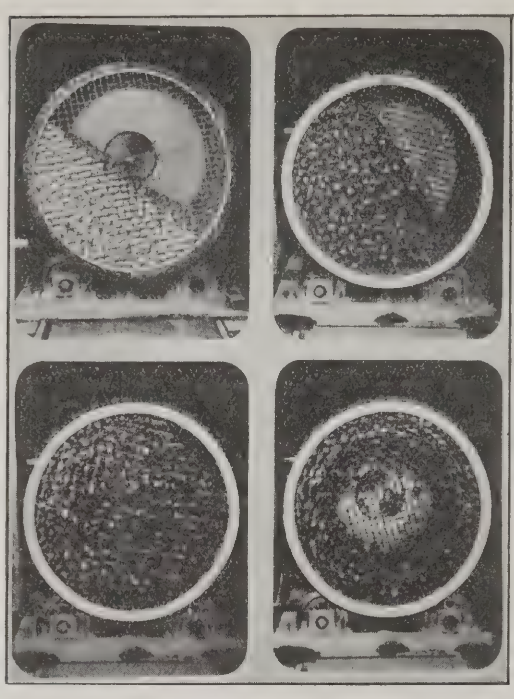
the other, during the whole time subject to attrition between the stones themselves and between the stones and the interior steel lining of the mills.

It will be understood that this is a very costly part of the manufacturing process, the cost of grinding being in inverse ratio to the fineness; the finer the powder, and therefore the more valuable article, the greater the cost to the manufacturer. The most modern practice in this department has led to the reduction of the clinker to such extreme fineness that all passes through a 50-mesh sieve, 98 per cent. through a 76-mesh sieve, 95 per cent. through a 100-mesh sieve, and from 80 to 85 per cent. through a 180-mesh sieve, the sieves mentioned corresponding to 2,500, 5,776, 10,000 and 32,400 holes per square inch respectively.

It is at this point of the manufacture that the regulation of the

Setting Time

of the cement is effected. A thoroughly well-made and finely-ground Portland cement is always, when first ground, very quick-setting. The more thorough the amalgamation of the raw materials the more perfect the calcination, and the finer the grinding the greater the chemical activity of the cement produced when mixed with water, and therefore the quicker the set.



INTERIORS OF TUBE MILLS REVOLVING AT DIFFERENT SPEEDS.

Except for work under water, a very quick-setting cement is not desirable, and therefore it is necessary for the manufacturer to neutralize the initial setting of the cement by one or other of the recognized methods. Hitherto this has been done by the addition of various small percentages of gypsum ($CaOSO_3$), but as some engineers have an objection to an admixture of this material the manufacturer was left to seek some other means of attaining the same object.

A New and very Effective System,

which has been in use now for some time, was patented by the Associated Portland Cement Co., and consists of subjecting the cement in the final stage of grinding to a moist atmosphere. This is done by injecting into the tube mill already described a quantity of steam, regulated at will, which keeps the atmosphere in the enclosed mill saturated with moisture, so that as the mill revolves carrying up and rolling over the stones and cement therein, every particle of the latter is subjected to a continuous and repeated process of superficial hydration, eventually leaving the mill in the finished condition, each molecule of cement equally treated. The process is one of great simplicity and follows quite natural lines. It is well known that a quick-setting, cement if allowed to become aërated by exposure to the atmosphere becomes slow-setting, and that in proportion to the period of aëration; it also improves in soundness by the neutralization of any particles of free lime present through the absorption of water and carbonic anhydride (CO_2) from the atmosphere. This action is very imperfect, however, when cement is stored in bulk, and can only be in a measure successfully accomplished by continually turning over the cement and exposing fresh surfaces for aëration.

The new system was perfected to overcome these difficulties, and it will be readily understood that the amount of hydration or aëration that each atom or particle of cement is subjected to under the new process during a period of one or two hours in the saturated atmosphere of the rolling tube mill is much more perfect than is the case when cement is stored in bulk and depends on absorption from the atmosphere for its aëration.

It is not generally known that the free or loosely combined lime in cement will not absorb carbonic anhydride from the atmosphere until it has first taken up moisture and become converted into the hydrate (slaked lime), in which condition it is free to absorb carbonic anhydride from the air being then converted into inert calcium carbonate.

The effect of the hydration process, as adopted by the Associated Portland Cement Manufacturers (1900) Ltd., is first to hydrate any trace of free lime present, thus improving the soundness of the cement, and, secondly, to hydrate the loosely chemically combined aluminates of lime, to which latter are attributed the quick initial setting properties of the cement.

The system permits of such minute regulation, depending on the amount of steam injected, that the setting time of the cement being produced can be permanently regulated to comply with the requirements of any specification, the total maximum absorption, even for a slow-setting cement, being less than 1 per cent.

Having passed this final stage of the manufacturing process, the cement is delivered to the warehouse, where it remains till the mechanical heat due to the friction of grinding is eliminated, when the cement is ready for immediate use.

The time at disposal will not admit of a more lengthy description of the three main processes, but from what has been said it will be seen what strides have been made during recent years in bringing the manufacture of Portland cement on to a thoroughly scientific basis. Sufficient has been said, however, to enable a comprehensive view to be taken of the various tests to which the cement has to be submitted in the hands of the consumer.

(To be concluded.)

Kirkstead Chapel, Lincs.—The Society for the Protection of Ancient Buildings has been drawing attention to this chapel, which belongs to a private owner who does not keep it in repair. The chapel is one of the most beautiful examples of pure Early English architecture, and has every claim to be carefully preserved as a national monument. Attention is also drawn to Carisbrooke Parish Church, a fine specimen of Perpendicular architecture. The bells are hung in such a way that the strain and vibration caused by their ringing are beginning to produce cracks in the stonework.

Builders' Notes.

Change of Address.—Messrs. A. Ransome & Co., Ltd., engineers and ironfounders, have moved from 304, King's Road, Chelsea, to 63, Queen Victoria Street, E.C.

Labour in the Colonies.—From a circular just issued by the Emigrants' Information Office, 31, Broadway, Westminster, it appears that there is a sufficiency of building trade labour in the Colonies, though New Zealand just now offers good employment.

The Extensions to the Withington Workhouse Infirmary, Manchester, are being warmed and ventilated by Shorland's double-fronted patent Manchester stoves with descending smoke flues and patent Manchester grates, supplied by Messrs. E. H. Shorland & Brother, of Manchester.

£100 Houses of Concrete.—At Saffron Walden sixteen dwellings for artizans—eight in a block—have been erected at a cost (including ground) of £100 each. They contain some five and some four rooms, and have a separate washhouse and a garden back and front; and they let readily at 3s. 9d. per week. The kitchen is the biggest room in the house.

"Sand or other Suitable Material."—A Sheffield builder was fined £6 and costs (14s.) last week for constructing two dwelling-houses with defective mortar. Clayey matter had been used instead of sand. The defendant urged that the by-laws said "sand or other suitable material" was to be employed; the Bench, however, thought the material used in this particular case was not suitable.

Standardization of Water Fittings.—In their New River department the Metropolitan Water Board has a complete standard for all fittings, the result of the most accurate scientific study and many years of experience. They have a testing department 400ft. by 60ft., two storeys high, fitted up with all the most modern apparatus for examination, gauging and testing, and no fitting of any sort is allowed to be used until it has been taken to pieces, gauged and examined for interchangeability, quality and weight in every part, and then subjected to the necessary hydraulic test.

Garden City and the Unemployed.—The Garden City Co. have accepted an offer made by a lady to subscribe £700 for the employment of men recommended by the Mansion House Committee, and arrangements have been made to supply up to 100 men for about three months and to undertake the expense of providing accommodation and supervision. The first twenty men will be sent down to Hitchin this week. The Garden City Co. will pay the value of the work done to the extent of the above subscription. It is desirable, however, that the £700 should be supplemented by additional funds subscribed on the same basis, so as to bring up the total amount available for the special unemployed works to £2,000. This would permit over 200 men to be employed on productive and healthy work for at least three months. The directors are willing to grant shares for subscriptions given on the above footing, and will only use the money for paying for the actual work completed.

A new Workhouse Infirmary at Chesterfield has been erected at a cost of £40,000. In addition to the infirmary, a nurses' home, porter's lodge, boiler and engine-house, workshop, mortuary and disinfector have been erected, and certain structural alterations have also been made to the workhouse wards, &c. Messrs. Rollinson & Sons, of Chesterfield, were the architects, and Messrs. Maule & Co., of Nottingham and Chesterfield, the builders.

FRENCH ART SCHOOLS.

Report of a Glasgow Deputation.

THE deputation from the Glasgow School of Art, consisting of the chairman, Mr. James Fleming, with two other of the Governors, Mr. W. Forrest Salmon, F.R.I.B.A., and Mr. John J. Burnet, A.R.S.A., F.R.I.B.A., and the headmaster, Mr. Fra. H. Newbery, appointed to visit the more important of the national and municipal schools of art in France, have just issued their report in pamphlet form.

The schools visited were the Ecole Nationale des Beaux Arts, Lyons; Ecole Nationale et Speciale, Paris; Ecole des Arts Decoratifs, Paris; Ecole Nationale des Arts Industriels, Roubaix; and Ecole Municipale des Beaux Arts, Lille. It was not found possible, as at first intended, to visit the School of Art at Toulouse.

Introductions were obtained through the French Ambassador in London, M. Cambon, by the agency of the Scotch Education Department.

The deputation left Glasgow on January 15th, 1904, and returned on January 26th.

Lyons.

The schools of art in Lyons are (1) the Ecole Nationale des Beaux Arts controlled by the State, but having a local council of sixteen councillors; (2) four municipal schools, and (3) a municipal school of weaving.

Particulars of the courses of study in each school are given in the report.

An inspector of the fine arts is sent annually from the Ministry of Public Instruction and of the Fine Arts in Paris to report upon the work and efficiency of the schools. No fees are charged to students, all instruction being gratuitous.

The director and professors are paid fixed salaries by the municipality.

The school is supported by an annual grant. The budget covers an expenditure of about £4,000, of which the State furnishes about one-third.

In architecture there is no constructional side to the course other than geometry and perspective. These latter courses are, however, obligatory upon all students, as also the lectures on the history of art.

Paris.

In Paris the Ecole des Beaux Arts, Rue Bonaparte, is practically the University of Art not only for France but for the whole world. French students, sent as bursars by practically every city and town in France, form by far the majority, and among other countries contributing students perhaps America sends the most. Instruction throughout is free, and there is no registration fee. No students more than twenty-five years of age are admitted. Entrance examinations are held twice yearly, and these are very exacting. From painter, sculptor, architect and engraver candidates, admission work is demanded. Should this gain acceptance, other proofs follow to be executed before the candidate is permitted to be enrolled.

Architect candidates have to submit to, instead of submitting, a test of their powers of design, and have further to execute work in drawing from the antique and ornament, modelling, calculations and logarithms, arithmetic, algebra and elementary geometry, descriptive geometry applied to architecture, descriptive geometry, oral proofs of history knowledge, and a written composition.

The subjects taught at the school are drawing, painting, sculpture, architecture and engraving.

There is no section for decorative art, as commonly understood; nor does design for the manufactures form part of the curriculum. Mr. Henri Mayeux, however, gives an annual course of lectures on the decorative arts to students of the Ecole Nationale et Speciale des Beaux Arts. There are three ateliers for painting, three for modelling and three for architecture, each atelier receiving visits from a professor three times weekly; in addition lectures are given.

The whole system of teaching and study is based upon examinations for awards, competitions for prizes, and the submission of specified work for prizes and bursaries. All judgments are made by juries special to each section of school work, these juries being chosen by the professors among themselves.

The Architectural School is divided into first and second courses. A diploma of architecture is granted to students who successfully complete the work of these two courses. Besides the Grand Prix de Rome, belonging to the Institute de France and entitling the winner to a four years' residence at the Villa Medici or French state art school in Rome, the school is very rich in gifts and legacies, generally granted for special studies in the three arts respectively. The Foundation Chenavard is specially for poor students, and is divided among painters, sculptors, architects and gravers. The number of foundationers, as also the value of each respective bursary, is determined by the school council. The Société Centrale des Architectes Françaises appears as a donor, and a prize is given by American architects educated in the school. These gifts and legacies are outside the prizes and medals offered by the school itself.

The Ecole Nationale des Arts Decoratifs in the rue de l'Ecole de Medicine is, as its subtitle implies, a school for the application of fine arts to industry. All instruction is free.

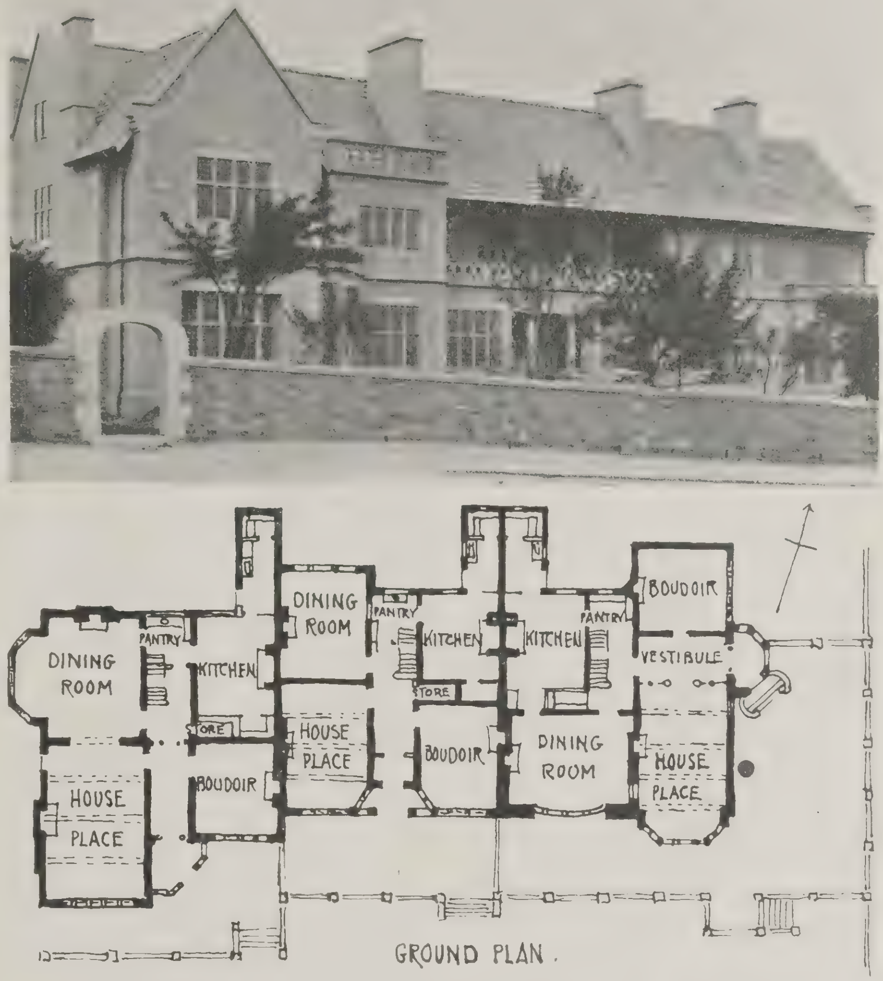
Candidates for admission submit either a study of ornament in light and shade, a modelled study, or an exercise in architecture, according as they wish to be enrolled in either one of the courses of drawing, modelling or architecture.

The subjects taken are drawing, modelling, geometry, plant study, architecture, mathematics, ornament and architectural composition, history of art, perspective and anatomy. There are special studios for ornament applied to industry (painted and modelled), and also a special atelier for architecture.

At the museum of architectural casts installed in the Palais de Trocadèro the Governors ordered a collection of casts for the use of the Glasgow School of Art. These consisted of figures from the Porte Royale of the Cathedral of Chartres, Corbeil, a complete doorway from Toule, Barye's lion and serpent, and other smaller specimens.

Roubaix.

At Roubaix the deputation visited the Ecole Nationale des Arts Industriels, which occupies a unique position in the scheme of French national art education. It was created as the result of an agreement in



THREE HOUSES AT HALIFAX. BUTLER WILSON AND OGLESBY, ARCHITECTS.

These houses have been erected on a building estate developed by the architects at Manor Heath, Halifax. An attempt has been made to gain an appearance of homogeneity by treating the exterior as a concrete structure, with an arrangement of plan which should shatter as little possible the ideal cherished of the Englishman, namely, that his house is his castle. The exterior walls are of split-faced wall-stones with tooled dressings, and the roofs of heavy grey slating. In each dwelling is contained a house place or common room lined with oak wainscotting and having an oak-beamed ceiling.

1882 between the State and the town of Roubaix. The institution embraces a school of art, a technical college, schools for weaving, dyeing and spinning, a picture gallery, an industrial museum, a museum of casts and a library.

The school is under the authority of the Ministry of Public Instruction and of the Fine Arts, and is administered by a council acting through an administrator nominated by the Minister.

The school is supported by a State grant and by an annual contribution from the town of Roubaix.

The deputation was struck with the business-like atmosphere pervading this school; and the earnestness and industry of the students were very apparent. The Administrator stated that students in many cases came straight from their work to the school. The subjects taught are chiefly those having direct bearing upon the industries and manufactures of the city, and the object of the authorities appears to be to keep thoroughly in touch with local demands. Students are received into the classes from eleven years of age, and the deputation was told that if the future occupation of the student was to be one connected with art industries, instruction in drawing took precedence of all other subjects in his ordinary education.

Lille.

At Lille the deputation visited the Ecole Municipale des Beaux Arts. This is not under the direct authority of the Ministry of Public Instruction, the actual administration being vested in a committee of twelve members, including the mayor of Lille, two painters, two sculptors, two architects, two engineers (nominated by the mayor), and two members nominated by the Ministry.

The aim of the school is to take children not less than nine years of age, and knowing how to read, write and arithmetic, and by courses of study to make them: (1) architects, painters, gravers and sculptors, ready to enter at the age of thirteen into the Ecole Nationale des Beaux Arts in Paris; (2) draughtsmen, surveyors, superintendents of bridges and roads; (3) foremen and workmen, well equipped intellectually in mechanics, carpentry, masonry, and as stone carvers, &c.

To obtain these results all students have to pass through an elementary course in a preparatory school in ornament, geometry, colour-washing, sketching, elementary architecture and building construction; and an advanced course in the school itself in ornament, descriptive geometry, statics, mechanics, modelling, antique, life painting, advanced architecture, perspective and the history of art. At the age of twelve years the students begin to specialize towards the end they have in view, as coming under the three heads above mentioned.

The instruction is free.

Conclusion.

In concluding their report the deputation observe that in France education is free, but that no student may enter a school of art until he has passed an entrance examination. This examination demands preparatory instruction, which is provided for in special preparatory schools.

"The ordinary French student is compelled to follow a definite and rigorous course of training, which ensures a thoroughness

LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

that has not as yet been possible to reach in Scotland. One of the reasons for this is that art education is felt everywhere in France to be an absolute necessity. It is encouraged alike by the State, by the civic authorities and by the manufacturers. The gratuitous instruction that everywhere prevails may partly account for the organization and methods to be found in the French schools. The French people take art and art instruction much more seriously than is the case in Scotland. . . ."

The deputation feel they have derived much good from their visit, and have gained an experience of work and methods which should be of great service to the Glasgow School of Art. It is hoped that by the aid of the continuation classes of the Glasgow School Board and by the establishment at some early date of a preparatory school, the thorough preparation of students for the Glasgow School of Art may be ensured.

The general excellence of the work of the School in drawing and painting will bear comparison with that produced by the Continental schools, but in architecture, advanced design and figure composition there remains much to be accomplished in Glasgow.

OUR PLATES.

THE new inn at Bolsover, Derbyshire, was erected for the Chesterfield Brewery Co., Ltd., to serve a country mining village of about 1,500 inhabitants. Stables and a bowling green are provided in the rear. Externally the materials are Leicestershire sand-faced bricks and green slates. The woodwork of the rooms is in some cases green stained pitch-pine and in others fumed American oak. The plaster is finished with a stucco surface and distempered in "Duresco." Oak tables and chairs were selected from Mr. John P. White's catalogue from the designs of Mr. M. H. Baillie Scott; the seating, counter and other fittings were executed in the same material by Messrs. Eyre & Sons, of Chesterfield, to the architect's designs. The walls have since been hung with Mr. Cecil Aldin's hunting prints. The general contractor was Mr. H. Oakey, of Bolsover, and the decorator Mr. C. Scott, of Mansfield. The total cost, including all fittings and laying-out the grounds, was £3,500. The architect was Mr. Percy B. Houfton, of Chesterfield.

A perspective of the exterior and a description of the drill-hall at Creswell, Notts, were given in our issue for April 29th, 1903. The architects were Mr. Percy B. Houfton, of Chesterfield, and Mr. F. C. R. Johnson, of Torquay.

The workmen's club and public hall at Creswell was erected for the Bolsover Colliery Co., Ltd., at their Creswell mining village. It serves the purpose of a workmen's club, a small children's library and a large meeting hall. As the club is not open to non-members, it is separated by pass-doors from the public hall entrance and the children's library. On the first floor is the hall, capable of seating about 400 persons; the small end wings provide respectively crush space with cloak-room accommodation and an ante-room in communication with the fixed platform. The materials are Mansfield stone, red bricks and tiles. Internally the rooms are fitted with oak seating and tables, the walls distempered and the ceilings treated with wooden cornices and moulded wood ceiling ribs. The roof of the large hall is open-framed. The coal fires are supplemented by a low-pressure heating system. The architect was Mr. Percy B. Houfton, of Chesterfield.

The Mattison board schools have been erected for the Hornsey School Board from the designs of Mr. Arnold Mitchell and Mr. Alfred Butler, joint architects. The general lay-out of the blocks is given at one corner of the illustration.

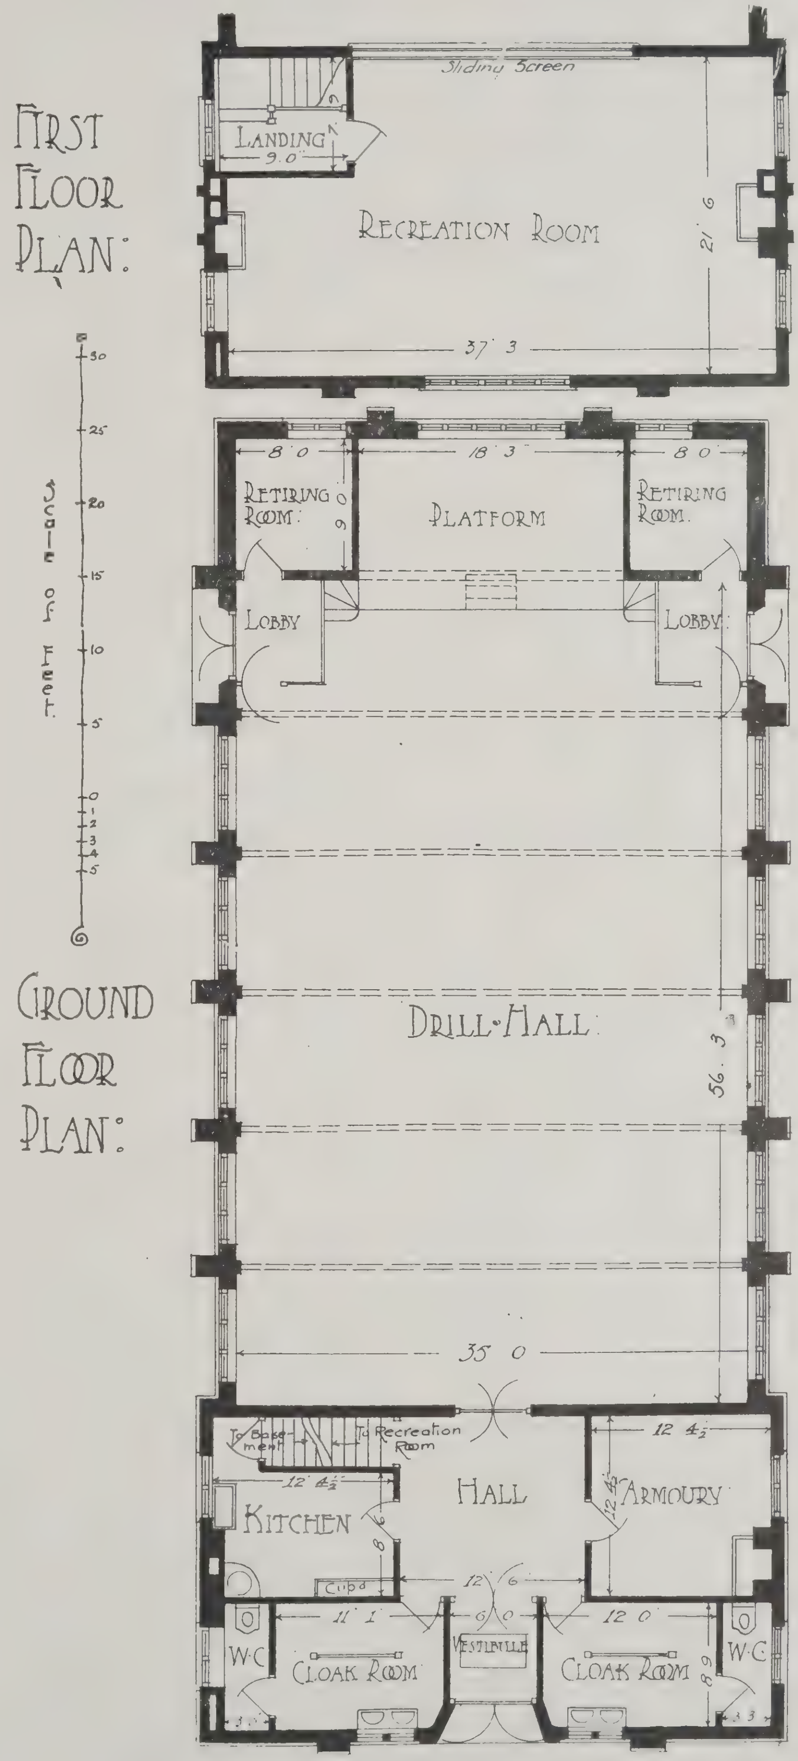
Obituary.

Mr. H. E. Stelfox, A.R.I.B.A., of Manchester, died recently, aged 49.

Mr. J. T. Wimperis, F.R.I.B.A., died on December 21st, aged 75. In 1889 he took Mr. W. H. Arber into partnership, which association existed till the end of 1897, when the partnership was dissolved and Mr. Arber purchased Mr. Wimperis's interest in the practice. A large number of hotel, domestic and business premises have been erected by the firm.

Mr. W. G. Laws, M.I.M.E., M.I.C.E., for many years city engineer and surveyor of Newcastle-on-Tyne, died recently, aged 62. He retired from this position in 1901, being then appointed consulting engineer.

The late Mr. Andrew M'Meckan, of Greenock, formerly of Cape Town, retired



DRILL HALL AT CRESWELL, NOTTS. PERCY B. HOUFTON AND F. C. R. JOHNSON, ARCHITECTS.

builder, who died in New York on October 7th last, left personal estate which has been valued at £31,612.

Mr. Arthur Ansell, builder, of Hitchin, died recently, aged 78.

Mr. John Ross, builder, of Aberdeen, died recently, aged 79. He retired from business six years ago.

Keystones.

The Vinery at Hampton Court Palace is being rebuilt by order of the King.

In the Chapter-house of Canterbury Cathedral a new west window has been executed by Mr. A. C. Hemming, of London, W.

At the Coliseum there is an interior scene at the "Spaniards" tavern, Hampstead Heath, furnished by Messrs. Oetzmann & Co., of 62-79, Hampstead Road, W.

Mr. Philip Watts, F.R.S., Director of Naval Construction, has been elected a vice-president of the Junior Institution of Engineers.

The Winter Exhibition of the Royal Academy is now open at Burlington House. Watts's equestrian statue of "Physical Energy" still remains in the quadrangle.

R.I.B.A. President's "At Home" will be held at Conduit Street, W., on Monday, January 16th, from 8.30 to 11, when there will be an exhibition of sculpture allied to architecture in modern work.

"A Novel Method of Roofing a Church."—Messrs. Hay & Henderson, of Edinburgh, were the architects under whose direction new roofs to Corstorphine Church were constructed by Messrs. Stuart's Granolithic Stone Co., Ltd., as described and illustrated in our issue for December 21st.

Kleinpflaster Roads are to be tried in England by Mr. William Oxtoby, borough engineer of Camberwell, and Mr. Brodie, the city engineer of Liverpool. The surface is practically a mosaic of undressed granite or basalt cubes made in about six different sizes, of which the most usual is 3½ins. by 3¼ins. by 4ins.

The Front of Milan Cathedral is to be reconstructed. The work, however, will occupy ten years. The lower part up to a height of about 50ft., including the five doors by Pellegrini, will be left untouched, but the several stages of windows at present existing will be replaced by single big windows (five in all) between the buttresses: and the crowning will be altered.

"Architectural and Building Events of 1904."—The bank illustrated at the bottom left-hand corner of p. 16 of the supplement to our issue for last week is not at Liverpool, but at Charing Cross, Birkenhead; also, in a paragraph on the same page, the architects of the new bank at the corner of Bold Street, Liverpool, are given as Messrs. Woolfall & Eccles, whereas Mr. J. Francis Doyle was the architect. We regret these errors, which, however, we may say were due to our having lost a slip with certain names and titles on it.

The Rebuilding of St. Mark's Campanile, Venice.—Nearly two years and a half have elapsed since St. Mark's Campanile fell, and it is calculated that four more years will be needed for its reconstruction, the cost of which is estimated at £80,000. Around the old foundations have been placed 3,000 piles of larch 10ft. in length. Venetian and Istrian stone, as well as cement, are being employed for the foundations. Roman pozzolana, the strongest kind of mortar, will be used in the construction of the new tower. The loggetta of Sansovino will be reconstructed out of the old pieces. It is calculated that the total weight of the new campanile will be 12,000 tons.

Herculaneum.—Professor Waldstein is in America lecturing on the proposed excavation of Herculaneum. President Roosevelt has associated himself with the scheme.

A new Technical School at Burnley is to be erected at a cost of about £60,000. The site forms part of the Bank Hall grounds. It comprises 10,000 sq. yds. and has cost £5,000.

The "International" will open its next exhibition on January 9th at the New Gallery, which will be arranged in accordance with a new scheme of decoration devised by M. Rodin, president of the Society.

Calendars for 1905 have been sent to us by Messrs. George Wragge, Ltd., of Manchester (designed by Mr. Sydney E. Castle), and by the Willesden Paper and Canvas Works, Ltd., of Willesden Junction, N.W.

New Banking Premises at Great Grimsby for the Union of London and Smith's Bank have been erected from designs by Mr. W. Campbell Jones, F.R.I.B.A., of London. Messrs. Hewins & Goodhand, of Grimsby, were the builders.

The Naval College at Dartmouth will be opened by the Prince of Wales on his return from Ireland. It will then have been two years under construction, the foundation-stone having been laid by the King in March, 1903. Sir Aston Webb and E. Ingress Bell are the architects.

Secret Commissions. — A Fellow of the Surveyors' Institution, in a letter to the "Times," protests against the practice of secret commissions of 10 and even 15 per cent. being received and, in many instances, demanded by surveyors, auctioneers and estate agents on builders' accounts for repairing, altering and decorating house property; and against commissions received on private sales of property from both vendor and purchaser.

At Nottingham Lunatic Asylum the temporary wood and iron dormitory containing forty beds for female patients is to be replaced by a permanent building, plans of which have been prepared by Mr. Frank B. Lewis, the city architect. The new building will be of two storeys, accommodation for forty patients being provided in one large dormitory on the ground floor, with thirteen single bedrooms above and one double bedroom for the use of the nurses. It is estimated that the total cost of the work will amount to £3,000.

The new Regent Bridge at Aberdeen Harbour was formally inaugurated last week. It takes the place of the old viaduct which for seventy-two years spanned the dock in the line of Marischal Street. The bridge has been in course of construction for six years and has cost about £60,000. The new passage is 67ft. wide, and is formed of granite masonry quay walls, the south wall or abutment being 190ft. long and the north 95ft. On the south abutment the new swing bridge rests, with the machinery below, while the pump house and dock offices occupy the west corner. The swing bridge itself is 156ft. long and weighs 700 tons. The engineers for the works have been Mr. Henry H. Wake, M.I.C.E., consulting engineer; Mr. R. Gordon Nicol, M.I.C.E., engineer-in-chief; Mr. William Simpson, A.M.I.C.E., executive engineer; and Messrs. Barr, Blackadder and Diack, assistant engineers. Sir William Arrol & Co., Ltd. (Glasgow), built the steelwork; Messrs. Glenfield & Kennedy, Ltd. (Kilmarnock), made the hydraulic machinery; and the railway work has been executed by Messrs. Hadfield's Steel Foundry Co., Ltd. (Sheffield). The Regent Bridge improvement scheme, of which the new bridge is the most important feature, includes also the widening (still in progress) of the quays. The total cost of the scheme is put at about £120,000.

Our new Telephone Numbers are 2200, 2201, 2202, 2203 and 2204 Holborn. The old number (416 Holborn) is discontinued.

Change of Address.—Mr. Arthur R. Groome, A.R.I.B.A., has moved from 2, St. Peter's Square, Manchester, to Palace Chambers, Hereford.

A Monument to W. E. Henley is to be erected in St. Paul's Cathedral. M. Auguste Rodin has offered to design a sculptured setting for his bust of Mr. Henley, which will be cast in bronze.

The Infectious Diseases Hospital, Settle, is to be erected at a cost of £4,000 from designs by Mr. T. A. Foxcroft, sanitary engineer to the council. Six sets of designs were submitted by architects, but rejected.

In Gibraltar Cathedral a brass to the memory of the late bishop has been erected from the design of Mr. R. Baker King, A.R.I.B.A., Westminster. Its setting, of alabaster, was supplied by Messrs. Harry Hems & Sons, of Exeter.

A new Garden City has been commenced by Mr. Rowntree at Earswick, about two miles from York. Thirty houses have been built and are already occupied, while eleven more are in course of erection, for all of which tenants are waiting. Most of the houses are let at 4s. 6d. per week, plus rates (about 8d. per week).

Iveagh House, Dublin, is now almost completed. It is to serve as a workmen's hotel or model lodging-house, and is the first building of the kind in Ireland. In detail it much resembles the Rowton Houses. There are 500 cubicles. A large block of artizans' dwellings is also nearing completion as portion of the Trust scheme.

Half a Million for the Improvement of Rome.—The municipal authorities of Rome propose to devote £500,000 to four important improvements, namely, the widening of the Via del Tritone (which is the Strand of Rome), the completion of the northern approach to the tunnel that has been bored beneath the Quirinal Gardens, and improvements at the new Ponte Umberto Primo (opposite the new Law Courts) and the approach to the new Ponte Gianicolense.

A new Baptist Church at Higham Hill has been built from designs by Mr. Edgar Stones, of London, at a total cost of about £5,500. It is Gothic in style, of red brick with stone dressings. The church (including the gallery which runs around three sides) accommodates about 800 worshippers and a hall below 600 scholars. The seating, in Orham wood, has been carried out by the Bennett Furnishing Co., Ltd., and the electric lighting and the ventilating fan and apparatus by the Ulcars Electric Co., of Stratford. Messrs. Jones & Sons, of London, are responsible for the hot-water system (low-pressure), and the inside clock was presented by Messrs. Sainsbury Brothers, church and turret clockmakers, of Walthamstow. The general contractor for the building was Mr. T. J. Coxhead, of Leytonstone.

Competition for Mitchell Library, Glasgow. - The Corporation of Glasgow propose to erect, in North Street, a new building for the Mitchell Library, including the Jeffrey Reference Library and the Moir collection, and have issued conditions of competition for the guidance of architects in preparing plans. No premium will be paid to the architect employed to carry out the work at the usual commission of 5 per cent.; but premiums of £100, £75 and 50 will be paid to the authors of the three designs placed by the assessors next in order of merit. Mr. John Keppie, F.R.I.B.A., the president of the Glasgow Institute of Architects, and Mr. McDonald, the city engineer, are the assessors. Designs are to be lodged by March 1st next, and are to be for a building to cost about £40,000.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Timber Accounts.

BARNSLEY.—COUNTRYMAN writes: "I have an account rendered for timber in various scantlings and do not understand the reading of the quantities as they are written, thus:—171 lin. ft. of 4ins. by 9ins. is written as 0 1 $1\frac{1}{6}$; 126 lin. ft. of 3ins. by 9ins. is written as 0 0 $17\frac{1}{6}$. I do not understand the parts of the standards. I have consulted various handbooks without result; will you kindly explain?"

Your timber merchant's account is quite in order. The St. Petersburg standard contains 120 "deals," each deal being 6ft. of 3ins. by 11ins. Each standard is divided into "quarters" and "deals," there being four "quarters" in a "standard," thirty "deals" in a "quarter," and six feet to a "deal." So that, in reducing feet lineal to standards, it is first necessary to bring the timber to the standard size of 3ins. by 11ins. (this is done by first multiplying the number of lineal feet by the breadth and thickness of the scantling and then dividing by 3 and by 11), and then to divide by 6 (for deals), 30 (for quarters) and 4 (for standards). The working of your examples is as follows:—

171ft. of 4ins. by 9ins.

Multiply the feet lineal by the breadth and thickness.
4
684
9
6156

Divide by 3 and by 11.
3)
11)12052
187ft. of 3ins. by 11ins. (standard deal).

Divide by 6 to bring ft. to "deals."
6)
$31\frac{1}{6}$

Divide by 30 and bring "deals" to quarters.
30)
1 $1\frac{1}{6}$

Divide by 4 to bring "quarters" to standards.
4)

	Standards.	Quarters.	Deals.
Answer	0	1	$1\frac{1}{6}$

The other example is worked in exactly the same way, but that (for brevity) it is not necessary to first multiply by 3 and then to divide by 3 (there being 3ins. in each scantling). Thus:—

126ft. of 3ins. by 9ins.
9
11)1134
equals $103\frac{1}{11}$ of 3ins. by 11ins.
6)103
$17\frac{1}{6}$ deals.
30)
0 $17\frac{1}{6}$
4)

Standards.	Quarters.	Deals.
0	0	$17\frac{1}{6}$

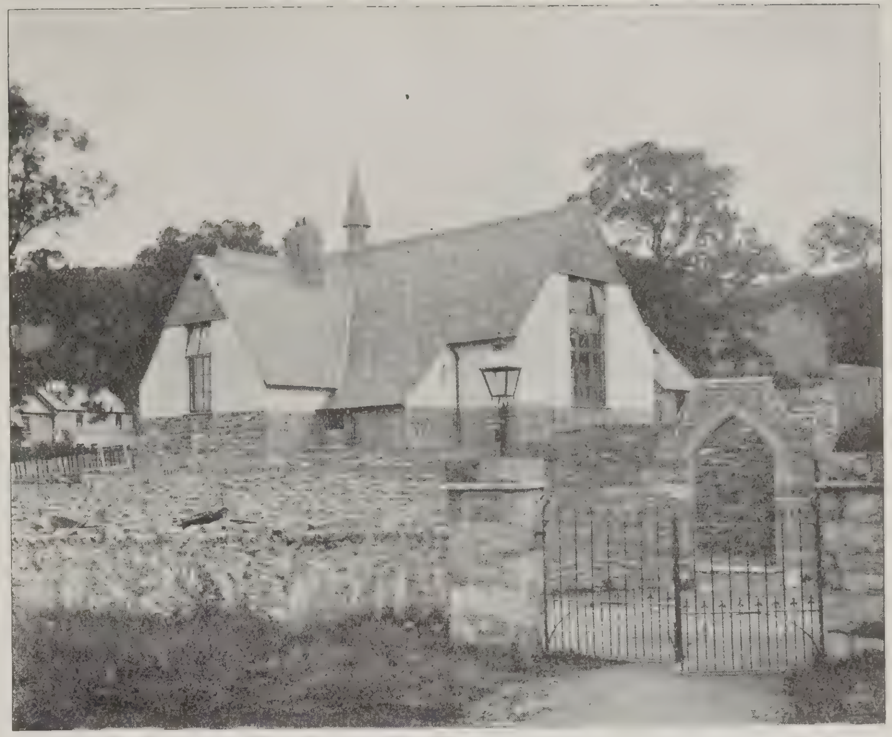
F. S. I.

Stability of Tall Chimney.

BRADFORD.—LOG writes: "Kindly state how to work out the stability of an octagonal chimney, say, 120ft. high."

An octagonal chimney will be worked out on the same principles as the square chimney illustrated and described in THE BUILDERS' JOURNAL for March 4th, 1903. As an octagonal chimney presents less obstruction to the wind than a square chimney, the normal pressure against a plane surface must be reduced by multiplying the vertical diametral plane taken through the angles by the coefficient ·82. The modulus of section of an octagonal chimney will depend upon the size and thickness. The modulus of section z for a hollow octagonal base $= \frac{\sqrt{2}-1}{4} \times \frac{D^4 - d^4}{D}$ where D and d are the outer and inner diameters across the flats.

HENRY ADAMS.



NATIONAL SCHOOL AT GYFFIN, NEAR CONWAY. H. L. NORTH, ARCHITECT.

This school accommodates 100 children and is used as a parish room as well as a school, being one room 48ft. by 18ft. divided by a folding glass screen into schoolroom and classroom. The roofs are of violet and green slates, and the walling is of blue grey local stone covered with cream rough-cast above. The painting is bright green and the chimney of brindled Buckley firebricks. Internally there are a red tile dado and cream walls and ceilings with plain pitch-pine wall-plates and tie-beams; screen doors and cupboards painted dark green. The total cost was £943, including latrines and fencing, &c. The builders were Messrs. W. and E. Williams, of Talybont, and the architect was Mr. H. L. North, B.A., of Conway.

Answers by Post.

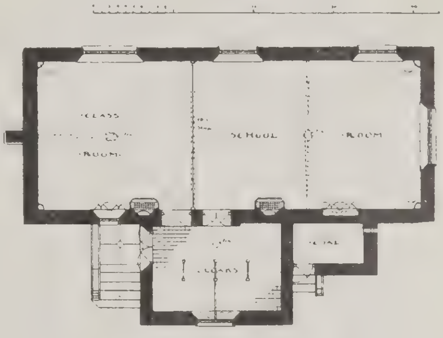
BRIXTON.—QUERIST writes: "Do you answer enquiries by post if a fee is enclosed?"

We cannot undertake to answer enquiries by post, though in special cases we endeavour to oblige our readers with immediate replies. No fee is charged, the only condition being that applicants shall be regular readers.

Repairing Clause in Lease.

ALPHA writes: "A clause in a lease says 'well and sufficiently repair and amend' and deliver up premises 'so well and sufficiently repaired and amended.' (1) At the expiration of the lease, can the lessor claim under this clause internal painting, if in bad order? (2) Can he claim damage for time occupied in doing necessary works after the expiration of the lease, the lessee having omitted to do them? (3) Can the lessor's surveyor's fees be charged against the lessee?"

(1) Yes; the lessor can claim for a reasonable amount of internal painting. There is a certain amount of tendency in favour of the lessee in all such cases however (refer to *Proudfoot* v. *Hart*, 25 Q.B.D. 42). (2) Yes "the landlord may also be awarded some compensation for the loss of the use of the premises while under repair" (see Wright's "Landlord and Tenant," page 198). (3) Yes. By the Conveyancing and Law of Property Act, 1892," 55 & 56 Vict. c. 13, sec. 2, sub-



sec. 1, a lessor "shall be entitled to recover . . . all reasonable costs . . . properly incurred by the lessor in the employment of a solicitor and surveyor or valuer, or otherwise, in reference to any breach," &c., &c. I advise you to procure a copy of the "Handbook on Dilapidations, prepared by the Practice Standing Committee of the Royal Institute of British Architects and issued by the authority of the Council" (published at the Institute, 9 Conduit Street, W., at, I think, 5s.). F. S. I.

Buildings to Measure at Bristol.

BRISTOL.—STUDENT writes: "Please name some buildings in or near Bristol (preferably Renaissance) suitable to measure for the final examination of the R.I.B.A."

As far as can be ascertained in London, there seem to be very few Renaissance buildings in Bristol. St. Peter's Hospital and the Exchange, Bristol; Prior Park, Bath; and Catherine Street Court House, near Bath, would all suit your purpose. Your best course would be to get information from the hon. secretary of the Bristol Society of Architects, Mr. H. Dare Bryan, F.R.I.B.A., 4, Unity Street, College Green, Bristol. M.

Connections to Sewers.

PONTELAND.—J. H. writes: "I am building two houses. Close by is another house. The public sewer is about 100yds. away and in private ground. The adjoining owner and I applied for the sewer to be brought up.

to within a certain distance of the houses. The rural district council has refused, and only passed the plans on the condition that we put in cesspools. There is no difficulty whatever in bringing up the sewer, and I do not suppose it will cost over £30. Can we compel them to bring the sewer up; if so, under what Act?"

This point is dealt with in 37 & 38 Vict. c. 55, s. 23. You cannot compel the council to extend their sewer; and as it is more than 100ft. away from the houses the council cannot compel you to connect with it. But under the same section the council can, as no sewer is available, compel you to put in cesspools to be "of such materials and size, and to be laid at such level, and with such fall as on the report of their surveyor may appear to them to be necessary."

Slating and Tiling.

LANCASTER.—CLERK OF WORKS writes: "Are the following methods considered the best for slating and tiling roofs which are to be plastered on the underside of spars:—Slates: Nail $\frac{7}{8}$in. grooved and tongued sarking on the spars, cover sarking with asphalt roofing felt, and copper nail slates over this without battens or bedding. Tiles: Tiling similarly laid but with tile battens on the felt and the tiles bedded at head in haired mortar. Is there any danger of rot from damp or condensation—especially with tiling, laid as described, where the only ventilation is through the plaster? The advantages appear to be that a warm roof is secured, and there is no inconvenience from the underside pointing coming off or being defective, as almost always the case against walls and hips."

The method proposed for slates is in our opinion inadvisable. In the first place, only $\frac{3}{4}$in. rough boards need be nailed on the spars, and, secondly, it has been found that capillary attraction occurs between the slates, and rainwater is drawn up under them, making a mud with dust that dries slowly because there is no ventilation, on account of the slates being nailed directly on the boards. This mud becomes dried only in seasons of drought, and a roof is thus cold and damp, which encourages the harbouring of germs and fungus and induces rot. A roof is more weather-tight when capillary attraction is avoided by not laying the slates too close. The following would be a good specification: Cover the roofs with $\frac{3}{4}$in. rough deal boarding and lay vertically thereon sarking felt with a 2in. lap, nailed at intervals of 2ins. with clout nails which shall have been dipped while hot in grease or oil; fix battens over felt, and cover with slates to a . . . . in. lap with No. 2 copper nails, ... ins. long, to each slate; the vertical joint to keep a true line from eaves to ridge. As regards tiles, the method proposed is suitable, but there is no reason for bedding the heads in haired mortar.

Copyrighting Plans.

IGNORAMUS writes: "Can plans of houses or any part of them be registered to prevent them being copied? If so, what is the approximate cost?"

A reply to a similar question to yours is given on p. 167 of our issue for October 22nd, 1902. You cannot copyright an original architectural plan, but as a "book" you can copyright (for 5s.) a lithograph of it which has been circulated. Elevations must be registered as "pictures." Full particulars can be obtained from the Registrar, Stationers' Hall, London.

Stable on First Floor.

CARDIFF.—T. A. B. writes: "I am preparing drawings for a stable for horses on the first floor of a building. How can I ascertain the weight per ft. super. that the floor should be constructed to carry? I propose to construct an ordinary iron and concrete floor—cross-girders of about 14ft. span and 10ft. apart, filled in with lighter joists to take concrete filling; the whole floor to be about 55ft. by 14ft. to take eight or nine horses."

Allow for $1\frac{1}{2}$ cwt. per ft. super., with a factor of safety of 10.

Surveyor, Admiralty.

BATH.—S. J. G. writes: "Where can I get particulars of the examination for surveyors to the Admiralty? What is the commencing salary?"

See reply to enquiry on p. 216 of our issue for May 4th, 1904.

On Becoming an F.R.I.B.A.

RAMSBOTTOM. — HAMMER BEAM writes: "How should I proceed to prepare myself for a Fellowship of the R.I.B.A.? I am well versed in building construction and quantity surveying and have a fair knowledge of the sciences."

Of course you can only become an Associate by examination and a Fellow by election. See the regulations in the R.I.B.A. Kalendar, price 2s. 6d. from the secretary, 9, Conduit Street, London, W.

Liability for Damage done by Frost.

LONDON.—T. T. writes: "A contract was given for pointing the fronts of some houses. About a week after they were done a severe frost occurred and some of the pointing fell away. Is the man who did the work liable to make same good?"

Yes, we think so; it clearly proves the pointing was defective or that proper precautions were not taken in view of the season of the year.

Dancing Floor.

COVENTRY.—ENQUIRER writes: "Which is the best form for a spring or chain dancing floor on the ground floor, with basement and partition walls under?"

See our issue for January 26th, 1898, for floors for dancing.

Design of Chimney Stacks.

LONDON.—B. R. writes: "Is there a book on the design and construction of factory chimney stacks? What determines their height and other dimensions?"

See "Boiler and Factory Chimneys," by Robert Wilson, price 3s. 6d. post free from our offices.

"Fumene."

ISLE OF MAN.—MECHANIC writes: "Where can I obtain 'Fumene,' said to be well adapted for colouring light oak?"

Fumene Company, 47, Martin Road, Woodside, South Norwood.

Sanitary Inspectors.

PETERBOROUGH.—H. M. S. writes: "What are the duties of a sanitary inspector? Also, what books and papers are there on the subject?"

See "The Sanitary Inspector's Guide," by Henry Lemmoin-Cannon (price 3s. 6d. post free from our offices).

Signing Form of Contract.

SUBSCRIBER writes: "(1) In executing the R.I.B.A. form of contract (where quantities form part of the contract) is it necessary for the employer to sign the drawings, specification and the bill of quantities, or is it legally sufficient if he signs the form of contract only, the builder signing the form of contract, drawings, specification and bill of quantities? (2) If it is necessary for the drawings, specification and bill of quantities to be signed on behalf of the employer, can the architect do so on the employer's behalf as his agent and without obtaining the employer's written authority to do so?"

(1) It seems only necessary for the builder to sign the drawings, specification and bill of quantities. (2) The architect is both in the position of an agent and a quasi-arbitrator, and the employer is bound by his decisions or orders. He cannot sign the conditions, however.

Bolection Moulding.

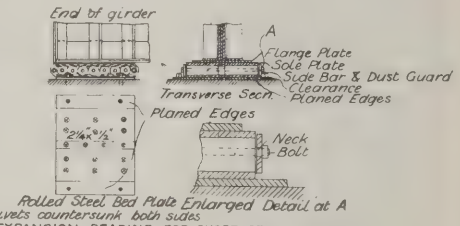
NEWCASTLE-ON-TYNE.—A. R. writes: "The question has arisen in the settlement of an account as to what constitutes a 'bolection moulding.' Is a moulding 'bolection' if it projects beyond the face of the framing, or is it necessarily rebated at the back?"

A bolection moulding is one which projects beyond the plane of the face—that is the definition and nothing more.

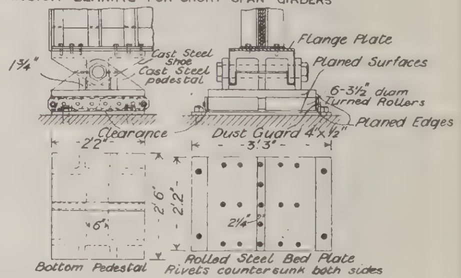
Expansion Bearings for Bridges.

BRADFORD. — LOG writes: "Please give details of expansion rollers for bridges."

Expansion rollers will vary considerably according to the type of bridge span, load, &c. The accompanying sketches are typical, short girders having plain roller bearings and long span girders pivot or rocker bearings over the rollers. At the other end the short girders have a plain flat bearing plate and the long girders a pivot or rocker with flat bed and no rollers. HENRY ADAMS.



EXPANSION BEARING FOR SHORT SPAN GIRDERS



EXPANSION BEARING FOR LONG SPAN GIRDERS

Pumping System.

ARBROATH.—X. writes: "(1) Please state the largest quantity of water that could be pumped with safety through a rising main of 2in. (inside) diameter in gallons per hour to a height of 170ft. What kind of pump should be used driven by an oil engine? (2) Is it workable to have only one pipe as a rising and delivery main? If so, please state the largest quantity of water that could be pumped through a 4in. (inside diameter) pipe to a height of 150ft. and 2,200 yds. long. I require about 25,000 gallons per day to be delivered to the reservoir." (Sketch sent not reproduced.)

Your question is not by any means easy to answer without an inspection. I see your main 4in. cast-iron delivery pipe has been put down twenty years. Therefore it is probably nearly done for, or at any rate badly encrusted, which would, of course, increase the water friction. My reply as to size of pump, &c., must not therefore be considered absolute, but as approximate only, and it is for you to decide whether you will try and utilize the present pipe or put down a fresh one. I do not see any objection to your coupling the 2in. main with the 4in., a stop valve being placed in each pipe to permit them to cut off or used as required. If you have a constant supply of water in the well, and a short suction, I think a triplex vertical single acting 4in. by 4in.

pump should do what you require. This pump when running at 75 revolutions per minute is capable of delivering—under ordinary conditions—40 gallons of water per minute at a cost of about 4-b.h.p. The pump should have a 4in. suction and delivery pipe, and is itself good for a water-pressure of 85 lbs. per sq. in. I assume, however, a total head of 170ft., or, roughly speaking, 75 lbs. per sq. in. Should the pressure exceed this, a greater b.h.p. and possibly a stronger pump would be required. The pump should be fitted with single reduction gear and have as short and straight a suction as may be.

M. POWIS BALE, M.I.C.E.,
Author of "Pumps and Pumping," &c.

Damage done by Adjoining Owner.

CROYDON.—L. G. M. writes: "At the side of my house is a private road leading to a cabyard. The owners of the road instructed their men to dig it up, and have raised the road and thrown it and the water, &c., into my garden and house. The water has soaked under the footings and caused a settlement, and the cabs have broken about 27ft. of my fence. I have written to the owners of the road, but no notice is taken of my requests. What course should I now adopt?"

The owners of the adjoining road have, of course, as little right to throw their drainage water on to your land as they have to damage your fence. I would suggest that, as you are unable to obtain even an acknowledgment of your complaints from your neighbour, you would do well to consult your solicitor before doing anything further. You must not take the law into your own hands, and the legal remedy is by action for an injunction and damages, but probably if proceedings be threatened you will be able to settle the matter without actual recourse to law. F. S. I.

Views and Reviews.

"Academy Architecture."

The two volumes of this well-known publication for 1904 are now before us, furnishing an excellent record not only of the architectural exhibits at last year's Academy but also the sculpture exhibits there, and the chief architectural works at the exhibitions of the Royal Scottish Academy, the Royal Glasgow Institute of the Fine Arts, the Paris Salon, as well as numerous buildings carried out or designed abroad. As usual, the illustrations are excellently printed and include several in effective colour.

"Academy Architecture and Architectural Review, 1904," Vols. 25 and 26. London: Alex. Koch, 58, Theobald's Road, W.C., price 4s. nett. each (paper covers).

Law Reports for Architects.

With architectural practice so set about by legal difficulties, as occur especially in regard to building in cities and towns, we are sure this excellent record of important decisions will be welcomed by the profession. The first requirement of such a compilation must, of course, be thoroughness, and on examining this first issue we find it fully exhibiting that quality. It is not so many reports clipped out and thrown together, but a compilation made with discretion, and the particular points brought out; illustrated, too, with photographs and plans where the case requires, as in *Home and Colonial Stores* v. *Colls*. The publication is proposed to be issued quarterly. It should prove of very great value and convenience to the profession. In this first issue reports of twenty-one important recent cases are given; also the text of the Easement of Light Bill and the proposed amendments to the London Building Act, some legal notes on the latter, as well as on "Landlord and Tenant" and "Light"; and extracts of a legal character from the presidential addresses of Mr. John Belcher and Mr. Guy Dawber. In his preface Mr. Crow draws attention to a new form of index—an accumulating index—which is introduced: this being divided under seven heads, and the cases arranged according to their subject-matter. "It is felt that the success of this work must depend largely on the co-operation of the profession generally, and it is hoped that architects will assist the editor by furnishing particulars of actions in which they may be concerned . . ."

We wish the venture every success. It is well done, and excellently printed.

"The Architects' Law Reports," compiled by Arthur Crow, F.R.I.B.A.; legal editor, A. F. Jenkin, barrister-at-law. Vol. 1. London: 18, Great Prescot Street, E., price 5s. post free

English Furniture.

This history of English furniture, issued in parts—the first two of which are before us—is superbly produced. To begin with, the illustrations are mostly to a large scale and many of them excellently reproduced in colour (after Shirley Slocombe). The work has been divided into four periods, namely, "the age of oak," from 1500 to 1660, comprising furniture that can be attributed to the Renaissance and its evolution from the Gothic; "the age of walnut," from 1660 to 1720, where the change is varied by the Restoration and Dutch influence, followed by a distinctly assertive English spirit; "the age of mahogany," from 1720 to 1770, where the introduction from France of fresh ideas in design marked another change; and "the composite age," from 1770 to 1820, inspired by an affectation for all things classical, combined with a curiously unbalanced taste. At a time when small "handybooks" are rather the vogue, with all their inherent scrappiness and lack of thoroughness, it is refreshing to turn to such a fine treatise as this, with its beautiful reproductions: moreover, the letterpress is inspiriting, being written by an authority and not a hash-up of so much museum information. Considering its quality and size, the price of 7s. 6d. for each part is very moderate.

"A History of English Furniture," by Percy Macquoid. Vol. 1, parts I. and II. London: Lawrence and Bullen, Ltd., 16, Henrietta Street, Covent Garden.

English Metalwork.

This is a volume of drawings—or, rather, indifferent lithographic reproductions of drawings—made by William Twopeny, F.S.A. (1797-1873). They have been unearthed from the British Museum by the editor, who has such an admiration for them that he even says Ruskin's best hardly excelled the pencil workmanship of Twopeny. Well, we have not seen the originals, but judging by these reproductions we certainly accord Ruskin's magnificent drawings a far higher place. The work of both men was essentially careful, but Twopeny's, while being certainly very good, has not the charm of Ruskin's. The quality of a pencil drawing, we admit, is difficult to preserve in a reproduction, but we think that the "pencil half-tone" process is far better than lithography; and though the former is more expensive we think the publishers would have done well to adopt it for this work. As for the examples themselves, they are mostly very fine specimens of ironwork discovered by an enthusiastic antiquary who went up and down the country making a careful record of such work, much of which has since disappeared. Lovers of old English ironwork will therefore find pleasure—and modern designers, maybe, many a useful hint (to put it mildly)—in looking over this book of drawings, though, reverting to our remarks above, we do not think the illustrations themselves will be esteemed for their intrinsic merit, however much that quality may be found in the originals.

"English Metalwork." Ninety-three drawings by William Twopeny, with a preface by Lawrence Binyon and some notes by Lawrence Weaver, F.S.A. London: Archibald Constable & Co., Ltd., 16, James Street, Haymarket, price 15s. nett.

NEW LONDON SEWERS.

Work to Cost £3,000,000.

A plan and report showing the vast extent of the great drainage operations now in progress or about to be commenced in London has been sent to members of the County Council. For years past an average of 12,000 houses has been added annually to the county of London, necessitating a huge expenditure locally on sewers which connect with the great main sewers running parallel north and south of the Thames London, unfortunately, is not blessed with two systems of drainage—one for houses and the other for streets. Thus it comes about that, when there is a heavy fall of rain, the news must be telephoned to the outfalls at Crossness and Barking, so that the moment the flood reaches these points the sludge-gates can be opened and the sewage allowed to pour into the Thames. It is this single-drain system which necessitates the construction of a greater number of sewers.

It is now nine months since a start was made with the first section of the great works which, when completed, will have cost three millions, and will, among other things, have provided a huge tunnel running from the extreme west of London to Barking, doubling the capacity of the great main drain which intersects the Great Eastern Railway at Stratford and passes to the outfall. The Works Department of the Council is at present engaged in building a section of a double tunnel for a new sewer from Old Ford to Barking. The work is divided into three portions, that handed to the Works Department being a mile and a quarter long and estimated to cost £147,280.

Another great work just commenced on the northern side of the river involves the construction of tunnel sewer from Hammersmith to Bow. There is also to be a new low-level sewer from Hyde Park Corner to Stepney, the contract for which is expected to be let about the middle of this year. On the south side of the river trial borings have been made in Plumstead and Catford, through which another tunnel sewer will pass for relieving the floodings in Loampit Vale, Lewisham. Work, too, is about to be commenced for the construction of a new outfall sewer, one section of which, $4\frac{1}{2}$ miles in length, is to cost £348,417. Two new sewers, each but half a mile in length, have been begun. For the West End of London great drains, each about a mile and a half in length, will shortly be undertaken. Their total estimated cost is £795,000. One will run from Cornwall Road, Notting Hill, to Upper Addison Gardens in Kensington. Another will extend from South Street, Wandsworth, to Battersea. These two sewers will cost £72,691. Plans for the new relief sewer from Holloway to the Thames are being prepared.

In addition to these works two pumping stations are to be erected for lifting the sewage from one sewer to another in order that it may gravitate to the outfalls. A new station at Battersea is to be erected at a cost of £7,000, and another at Bermondsey, the cost of the site for which will be £10,000.

When the whole of these works are completed—about four years hence—it is expected that floodings in London will be but memories. The Council will then control over 300 miles of main and flood sewers—excluding, of course, the local sewers in every borough—and a staff of over 1,000 men for dealing with more than a hundred thousand million gallons of sewage annually, as well as a fleet of seven ships which convey 7,000,000 tons of sludge yearly from the Thames to deep sea; and by that time about £7,000,000 will have been spent in the construction and working of the tunnels which convey the sewage out of London.

Bankruptcies.

[Abbreviations: R.O.—receiving order; P.E.—public examination; C.C.—county court; O.R.—official receiver; Adj.—Adjudication.]

DURING THE WEEK ending December 30th sixteen failures in the building and timber trades in England and Wales were gazetted.

H. E. CAPSEY, builder, Ilford. Adj. Dec. 17th.

W. J. RICE, builder, Lowestoft. Adj. Dec. 21st.

J. FARRER, builder, Cartmel. R.O. Dec. 19th.

CHILD BROTHERS, builders and contractors, Darlington. R.O. Dec. 17th.

R. J. WEBSTER, contractor, Stratford. R.O. Dec. 22nd.

J. H. BOOTH, painter and decorator, Ilkeston. R.O. Dec. 20th.

D. ROBERTS, builder, Chorlton-cum-Hardy. R.O. Dec. 22nd.

H. B. SMITH, builders' merchant, Ipswich. P.E., Ipswich Shirehall, January 20th, at 10.30.

T. J. HARROP, joiner and contractor, 12, Frederick Street, Rotherham. R.O. Dec. 21st.

C. MOELLER & CO., engineers, Bradford. R.O. Dec. 22nd.

J. DAY, builder, Wolverhampton. Gross liabilities, £1,724; £454 expected to rank for dividend; assets estimated to produce a surplus.

W. E. RICHARDS, builder, Sidmouth. R.O. Dec. 19th. First meeting, O.R.'s, Exeter, Jan. 5th, at 10.30. P.E., The Castle, Exeter, same day, at 11.30.

A. E. PUGH, painter and glazier, Bishops Castle, Salop. First meeting, 4, Corn Square, Leominster, Jan. 12th, at 10. P.E., Leominster Town Hall, same day, at 10.30.

B. HAYNES, builder, West Norwood. First meeting, 24, Railway Approach, London Bridge, Jan. 4th, at 12.30. P.E., Croydon C.C., March 1st, at 11.

Coming Events.

Wednesday, January 4.

BUILDERS' FOREMEN AND CLERKS OF WORKS' INSTITUTION.—Meeting at 8 p.m.

Friday, January 6.

ARCHITECTURAL ASSOCIATION.—Mr. Alfred Cox on "Libraries," at 7.30 p.m.

Saturday, January 7.

INCORPORATED BRITISH INSTITUTE OF CERTIFIED CARPENTERS.—Meeting at Carpenters' Hall at 6 p.m. Mr. J. D. Manners on "A Visit to Chatham Naval Hospital."

JUNIOR INSTITUTION OF ENGINEERS.—Visit to the Voelker Incandescent Mantle Co.'s Factory, Albert Works, South Street, Wandsworth, at 2.30 p.m.

ARCHITECTURAL ASSOCIATION (Camera and Cycling Club).—Fourth Annual Dinner.

Monday, January 9.

ROYAL PHILOSOPHICAL SOCIETY OF GLASGOW.—Mr. James Duncan Boyd on "The 'Reck' System of Heating," at 8 p.m.

LIVERPOOL ARCHITECTURAL SOCIETY.—Mr. John Wilson on "The Palace of Versailles."

Tuesday, January 10.

ARCHITECTURAL ASSOCIATION (Camera and Cycling Club).—Mr. W. M. Dobson on "St. David's Cathedral," at 8 p.m.

INSTITUTION OF CIVIL ENGINEERS.—Sir William Henry White, K.C.B., on "The Recent Visit to the United States and Canada," at 8 p.m.

NORTHERN ARCHITECTURAL ASSOCIATION (Students' Meeting).—Mr. Stanley A. Smith, P.A.S.I., A.R.S.I., on "Quantities," at 7.30 p.m.

CARDIFF, SOUTH WALES AND MONMOUTHSHIRE ARCHITECTS' SOCIETY.—Mr. E. Harding Payne, A.R.I.B.A., on "Public Baths," at 8 p.m.

Wednesday, January 11.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Associates' Meeting, lantern night, at 8 p.m.

Thursday, January 12.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.—Annual Dinner, Queen's Hotel, Leeds, at 7 p.m.

Friday, January 13.

GLASGOW TECHNICAL COLLEGE ARCHITECTURAL CRAFTSMEN'S SOCIETY. Mr. Joseph Somerville on "Timbers."

INSTITUTION OF CIVIL ENGINEERS (Students' Meeting).—Mr. James Swinburne, M.I.C.E., on "The Theory of Electricity and Magnetism," at 8 p.m.

JUNIOR INSTITUTION OF ENGINEERS.—Prof. Vivian B. Lewes, F.I.C., F.C.S., on "The Theory of the Incandescent Mantle," Westminster Palace Hotel, at 8 p.m.

January 10, 11 and 12.

SURVEYORS' INSTITUTION.—Students' Preliminary Examination.

New Companies.

MANCHESTER BRICK AND BUILDING CO., LTD., 102, Palmerston Street, Ancoats, Manchester. Capital: £5,000.

REDGAR ESTATES CO., LTD. Capital: £50,000.

IMPERIAL STANDARD TIMBER, LTD., to adopt an agreement with T. Hamilton-Adams, and to carry on the business of timber and lumber merchants, &c. Capital: £100,000.

WELSH MACADAM CO., LTD. Capital: £10,750.

Electrical Notes.

Electricity in 1904.

It is perhaps impossible to start a fresh year without summing up to a certain extent the progress or otherwise during the past twelve months. So far as 1904 is concerned, there is not much in the way of progress to relate either in the general advancement of the industry or in regard to new inventions. The former has been much retarded by the adverse financial conditions, which have prevented new enterprises being undertaken and have generally much reduced the amount of business done in every direction. Companies and municipalities have hesitated to commence works which were authorized, or to apply for money on account of those which were not. In consequence manufacturers have not received that large amount of business they have looked for, and, as a result, many men have been thrown out of employment. Amongst the several failures of the year, that of the Sir Hiram Maxim Electrical Engineering Company is the chief, whilst in practically all cases the profits have been so much reduced that the dividends have suffered considerably. Notable cases are the India Rubber, Gutta Percha and Telegraph Works Co., the British Westinghouse Co. and Willans & Robinson. Amongst the few that have held their own, or even improved their positions, are Dick, Kerr & Co. and the Edison & Swan Co. The condition of the former firm is most prosperous, due to its excellent management, whilst this feature in the latter has brought the company once more into the profit-bearing condition. Of new inventions there are few to speak of, partly no doubt owing to the want of money for exploitation purposes. Improvements have been made in electric lamps, as already noted in previous issues, and the single-phase motor is apparently only in its infancy. Perhaps the chief item of interest is the new Raworth system of regenerative control for electric tramways, by which in a simple and well-thought-out manner the motors are made to return current to the line when the cars are going downhill or stopping. A company with a small capital and several important orders has recently been successfully floated, and great things are expected of the invention. The worst period of the depression is generally recognized as having passed, and it is confidently hoped and expected that the new year will see a considerable revival all round and the commencement of many important schemes for traction and power now in abeyance.

An Electric Burglar Annunciator.

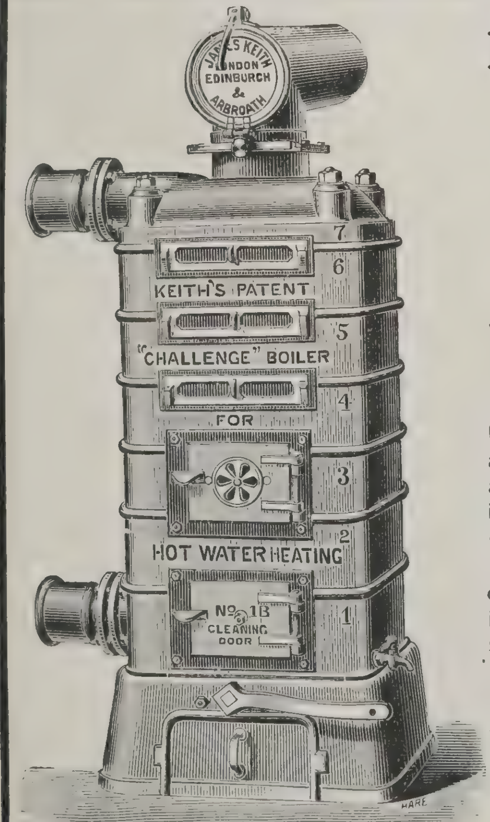
The disadvantage of the electric bell as a burglar alarm is that the burglar if he be up-to-date will be on the look-out for wires, and cut them, or if he hear the bell may have time to make off. The novelty of the above device is that it consists of a police light fixed outside the building and connected to doors, windows or other places likely to be forced or moved in such a manner that it lights up automatically in the event indicated. Being outside the building, its action is unknown to the burglar, whilst it gives the police sufficient time to quietly make their preparations.

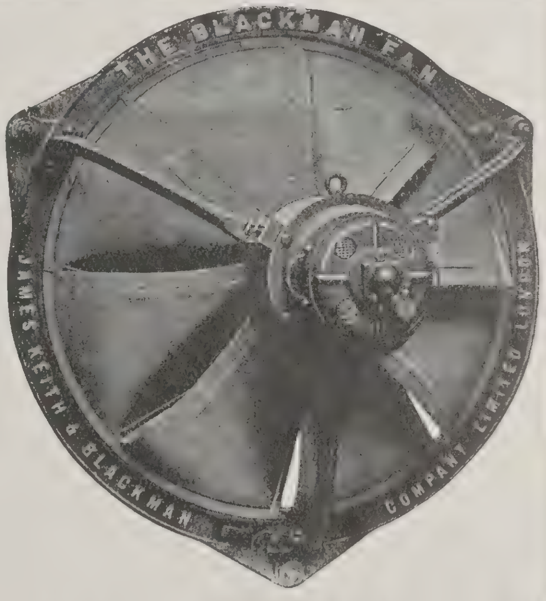
A new Leakage Detector.

A patent has been granted for a novel form of leakage detector which costs very little and indicates at once, either by sight or sound, when and where a leakage occurs. All such devices in use up to the present have necessitated the connection of one pole to earth, so that practically two apparatuses were required, one between each main wire and earth. In the new device the two mains are made to form the circuits of what is practically a differential galvanometer. A magnet or soft-iron float is suspended in the field of two coils wound in opposite directions, and the two mains are broken by these coils. Now it is evident that if there is no leakage current anywhere, the current going through the two coils is equal, and there will be no magnetic effect owing to the differential winding. A leakage on one main or the other will cause the needle to move to one side or the other, and if necessary to ring a bell or give any other signal. Such a device should be of considerable value, and indeed would be useful on all electrical installations.

A.M.I.E.E.

Mr. E. Kilburn Scott, M.Inst.E.E., A.M.Inst.C.E., has been appointed to organize and take charge of the Electrical Engineering Department at Sydney University, with liberty to do consulting work. Mr. Kilburn Scott was originally trained as a mechanical engineer, but for the last fifteen years has held responsible positions in electrical engineering work. Besides his technical knowledge, Mr. Kilburn Scott has had considerable commercial experience with Messrs. Johnson & Phillips, the International Electrical Engineering Co., for whom he was manager for the United Kingdom and the Colonies, as well as an independent consulting engineer. For "Specification" and "The Municipal Engineer's Specification" Mr. Kilburn Scott has contributed a series of articles and specifications on an electric light and power plant for municipalities; a complete electric tramway equipment; electric cranes and elevators; laundry machinery, &c. He was the first to publish a book on electric power in workshops and factories, and for many years has been a constant advocate of alternate current traction. He has recently advised the system for certain railways in North Wales. They will be the first to work with alternating current in this country.





THE BLACKMAN FAN
JAMES KEITH & BLACKMAN COMPANY LIMITED LONDON

KEITH'S Patent
CHALLENGE
BOILERS
FOR HOT WATER
HEATING

Utilise the fuel to the greatest advantage even while working with a rested fire, all the heat being immediately effective independent of the draught of the chimney.

All parts readily accessible for cleaning or examination. Rapid internal circulation. Supplied in sections easy for transport or handling.

In sizes to heat from 500 to 7,000 square feet of surface, also Other Classes of the "KEITH" Boilers.

Prices, &c. on Application.

BLACKMAN
ELECTRIC or BELT DRIVEN FANS
for VENTILATING.
Over 65,000 in use.

Privileges open to all Regular Readers of the "Builders' Journal."

As a Regular Reader of the Builders' Journal you are entitled to the following privileges:—

I.—Free Monthly Advertisements.

1. A Free Advertisement of 12 words in the Wanted or Miscellaneous Advertisement Columns, in one issue of the Builders' Journal during each calendar month will be given to any regular reader.

2. The charge of one penny will be made for each additional word.

3. Advertiser's Name and Address or Box Number must be counted, but will in no case be reckoned as more than five words.

4. All advertisements must be accompanied by the correct remittance, and should a receipt be required a stamped addressed envelope must be enclosed.

5. The Proprietors reserve to themselves the right of refusing any advertisement.

II.—Free Answers to Enquiries.

1. The services of a large staff of experts are at the disposal of all regular readers who require information on architectural, constructional or legal matters.

2. Questions should in all cases be addressed to the Editor, and be written on one side of the paper only.

3. Correspondents are particularly requested to be as brief as possible.

4. The querist's name and address must always be given, not necessarily for publication.

Note.—Owing to the large number of enquiries we receive weekly, we are compelled to restrict the advantages of this department to Regular Readers.

III.—Free Accident Insurance of £500.

1. Every regular reader of the Builders' Journal is entitled to the benefit of this Insurance.

2. Upon receipt of your name and address, an Accident Insurance covering a period of 12 months will be sent free.

3. A Pamphlet giving full details of this and other Insurance schemes inaugurated by the Builders' Journal for the benefit of its readers, and guaranteed by "The Ocean Accident Corporation, Limited," will be sent on application.

What is a Regular Reader?

We have employed the term "Regular Reader" throughout these announcements as the description "subscriber" is often understood to mean one who subscribes direct to the publishing office.

We mean by a Regular Reader anyone who has placed an order with us or any newsagent or bookstall for the Builders' Journal for one year.

Those readers who order the Builders' Journal through their local newsagent or bookstall should send us the newsagent's receipt. Their names will then be placed on our subscribers' list, and they will be entitled to all the advantages set out above.

Advertising Notes.

Advertising is the only force that will carry a business beyond the inertia of "quiet times" and keep it constantly going at its top pace.

Appointments Wanted.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterward, prepaid. Three insertions may be had for the price of two. Advertisements must reach the Office not later than 5 o'clock on Monday.

THE BUILDERS' JOURNAL SUPPLY DEPARTMENT.

We have been able to make satisfactory arrangements with the best Manufacturers of Drawing Office Requisites, and we propose to publish from time to time illustrated lists of the articles supplied with prices, &c., as follows:—

- No. 1 List. Sets of Mathematical Instruments.
- No. 2 List. Various Scales and Philotechnic Set.
- No. 3 List. Drawing Boards, T Squares and Set Squares.
- No. 4 List. Drawing and Tracing Paper, Tracing Cloth, &
- No. 5 List. Inks, Water Colours, Paints, Brushes, &c.

LIST No. 3.

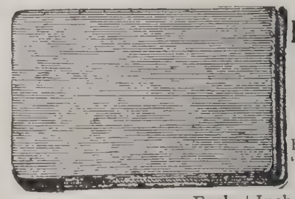
English Shaped T-Squares.

BEST MAHOGANY POLISHED T-SQUARES,

Extra Finish, Ebony Edged, Pegged and Keyed.

No. 140.

Length, 12 in.	taper blade,	**1/6** each.
" 18 in.	"	**2/6** "
" 24 in.	"	**3/-** "
" 31 in.	"	**3/6** "
" 36 in.	"	**4/6** "
" 42 in.	"	**5/6** "
" 48 in.	"	**6/-** "
" 54 in.	"	**8/-** "



DRAWIN BOARDS

No. 151.

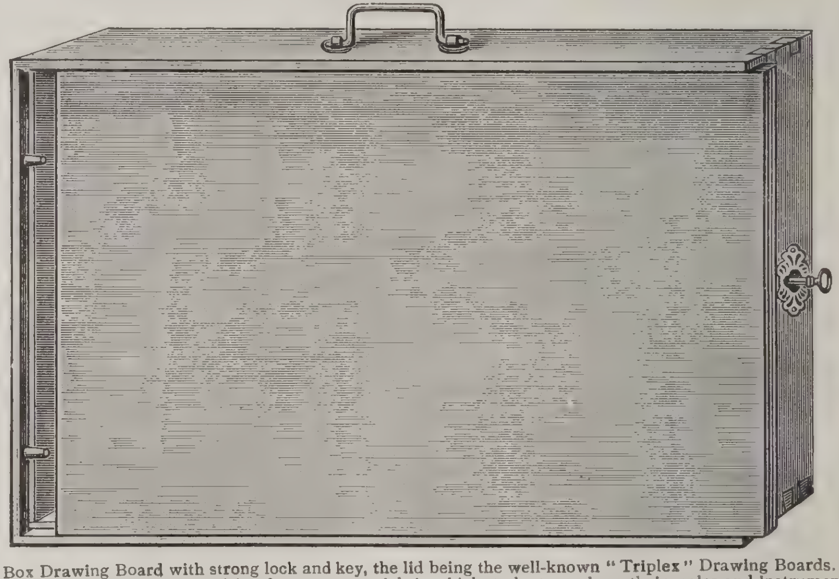
Each Board is stamp "E. & S. Triplex, 15

Inches.		Each.
13×9½	Imperial 4to	**1/-**
16×11½	Imperial 4to (full size)	**1/6**
17×10½	Half Royal	**1/6**
19×13½	Half Imperial	**1/9**
20×15½	Medium	**2/-**
23×16	Half Imperial (full size)	**2/3**

Inches.		Ea
22×17	Royal	**2/**
24×19	Half Double Elephant	**3**
28×19	Imperial	**3/**
30×22	(Special)	**4/**
31×23	Imperial (full size)	**5,**

BOX DRAWING BOARD. Price 5/6.

No. 170 F.

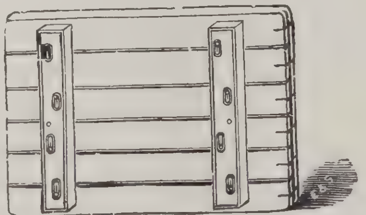


Outside Measurements—23⅜″ × 16¾″ × 2½″

Box Drawing Board with strong lock and key, the lid being the well-known "Triplex" Drawing Boards. Size 23×16 in. This is a most useful and necessary article in which students can keep their scales and instruments,

ENGINEERS' & ARCHITECTS' DRAWING BOARDS.

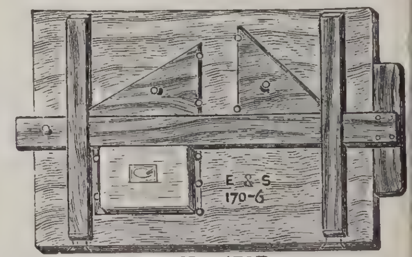
No. 144.



These Boards are made from best seasoned pine, grooved with mahogany battens, brass slots and screws to allow of contraction. One edge inlaid with ebony.

23×16 in., Royal	**7/-**
28×21 in., Imperial	**9/6**
32×23 in., Imperial (full)	**12/6**
42×29 in., Double Elephant	**16/-**
54×32 in., Antiquarian	**25/-**

DRAWING SETS.



Set No. 170B.

The "Student's Own" Drawing Set, comprising draw board (size 23 × 16), 24 in. T-square, 2 large set squa 12 drawing pins, and set of instruments in rosewood b case, comprising 4½ in. brass divider, needle-poi compass with pen and pencil points, bar. patent pe point, box of leads, slip rule, and pencil holder, **7/6** e

The above Prices include Postage within the United Kingdom.

Remittances and orders should be addressed to

* Accepted.

The Haymarket Theatre was reopened this week. Under the direction of Mr. C. Stanley Peach, F.R.I.B.A., extensive alterations have been made at a cost of more than £20,000—the original cost of the theatre when built in 1820. The pit, abolished under the Bancroft management, has been restored and seats nearly 200 persons. The theatre is now a two-tier house, and instead of twelve boxes there are four.

THE

BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD.

January 11, 1905. Vol. 21, No. 518.

6, Great New Street, Fetter Lane, E.C.

Summary.

In a paper on public libraries which he ead before the Architectural Association last riday, Mr. Alfred Cox said the rooms should e lofty, with windows high up and, where ossible, opposite to one another, for cross-entilation; the sills being 5ft. from the floor n the newsroom and lending liabrary so as o allow newspaper slopes and bookcases to un continuously around the walls. He did ot like the appearance of skylights or antern lights; they tended to make a room nything but cheerful. (Page 16.)

When an analysis is specified for any ement, the sample should be taken, if at the vorks, as soon as possible after the cement s ground, or, if after delivery to the onsumer, immediately on arrival; and in ither case the sample should be kept hermetically sealed. Unless this is done, no eliance whatever can be placed on the esults of the analysis. When making riquettes for testing, each mould should be eparate, and the briquettes should remain in e moulds (in a damp atmosphere) for wenty-four hours, after which they are careully removed for immersion in water, ccording to the requirements of the specifiation. (Page 22.)

In the Transvaal it seems that the general lea in taking out quantities is to get a ufficiency of "inclusive" items. The uantities issued by the Government are radually training local builders to price ork more in accordance with London ractice, and before very long they may have beneficial effect on the work issued by rivate surveyors. (Page 25.)

During 1904 prices in the timber trade ere dictated rather by what buyers and nporters were willing to give than by what wners and shippers wished to obtain; and ough the year was one of great disappointent to sellers, it did not afford an all-und profit to buyers, because, with a minishing outlet and falling prices, buyers ere constantly left with stock too expensive r their retail customers. (Page 25.)

Reports from all over the country speak of 04 as a very bad year for the building ades. (Page 21.)

The new Associated Building Trades in ew York declare that any trade refusing compel non-union men to obey their rules all be fined £100. (Page 24.)

In Germany a large number of cement orks have been erected within the last ten ears, but latterly there has been great overoduction, and while exports have ineased 28 per cent. the value has declined per cent. (Page 24.)

he index to Vol. XX. will be ready next week.

More Alarmist Reports about St. Paul's. It is about time some of the London newspapers stopped publishing alarmist reports about the safety of St. Paul's Cathedral. Periodically one or other of them starts a frantic outburst about the imminent danger of tunnelling, and then proceeds to elaborate sufficient matter to fill a column of sensation. "The Daily Express" is the latest offender. Judging by its heading of "London Undermined. St. Paul's Sinking: Cross 3ft. out of Plumb," one would expect the grand old fabric to be likely to crash down any moment. But the facts are very different. Mr. Harding, clerk of works at the cathedral for the last twenty-eight years, has said that, remembering the huge weight and size of the pile, there has naturally been a slight settlement southwards towards the river, so that the south-west tower is somewhat lower than its companion on the north-west, and the dome proportionately affected; but as for the cross being 3ft. out of plumb—that is pure concoction; at most there may be a deviation from the perpendicular of 1ft., while as regards the general stability of St. Paul's, there is no cause for any excitement, though of course repairs are needed. A fissure in the southern transept undoubtedly exists, but Mr. Harding says it has not widened in the least since he has been connected with the cathedral, nor is it likely to. Certainly there would be danger if any scheme were carried out which would tend to draw off the moisture from the gravel bed which constitutes one of the strata on which the cathedral stands, and for that reason the Chapter has objected to further tunnelling anywhere in the vicinity of the building; but, on that account simply, it is rank nonsense to work up the possibility of a collapse, and the "Express" would do well to leave such methods of journalism alone.

The Everlasting County Hall. While a committee of the London County Council has been instructed to furnish an absolutely definite report in regard to the best site for the county hall, Mr. A. R. Bennett, M.I.E.E., has managed to capture the attention of the newspapers with a scheme of his own which is certainly very magnificent at first sight, though when details are considered we fear it is quite futile. Briefly, Mr. Bennett's idea is to build a new bridge across the Thames from the foot of Arundel Street, to construct new thoroughfares on the other side of the river in connection therewith, to thus link up the north and south tramway systems, and to construct a huge county hall over the entire length of the bridge. This scheme is set forth in a pamphlet most admirably produced, but we do not suppose for a moment that it will be adopted by the London County Council, to whom it was submitted on January 2nd. Primarily, of course, the idea is to save the cost of a site, but that advantage is not compensated by any others. With many bridges, such as Vauxhall, the problem of securing proper foundations is difficult enough, but it is as nothing compared with that appertaining to the erection of such a huge building as Mr. Bennett proposes; and there is little value in citing such examples as the Ponte Vecchio at Florence, the Château de Chenonceau, and the old Pulteney Bridge at Bath, because they are merely toys compared with this, and Old London Bridge, with its houses, offers no comparison. The hall is proposed to be carried on Gothic arches spanning the roadway, with two floors above for offices. "The cost of carrying out the scheme," says Mr. Bennett, "would depend greatly on the method of construction adopted. Steel could enter largely into the fabric of both the bridge and the building, but it is doubtful whether the permanency of steel in such a structure is so well assured as to render its employment prudent, for a building of this kind should not be put up to last for merely a century or so. For preliminary purposes I have estimated for a bridge externally of granite, and internally of Yorkshire sandstone. The vaulting of the bridge, as well as the county hall itself, may be of concrete, ferro-concrete or brick, faced with Carrara ware. On such a plan I estimate that, taking an outside figure, the cost of the bridge, with the vaulting and approaches from the Strand to Stamford Street, and tramway connections, together with the acquisition of the necessary property on both sides of the river, would be about £2,500,000." The scheme, we think, will hardly commend itself to the officials at Spring Gardens, necessitating at least some sort of travelling footway so as to get from point to point (for it takes a full five minutes to walk across Waterloo Bridge), while the semi-darkness and the discomfort caused by the wind that would sweep under the vaulting in bad weather—sufficient already on open bridges—will not make the proposal more attractive to the general public likely to use the bridge. No, having waited so long for a county hall, and having lost the great opportunity afforded by the Strand improvement, such a scheme as this absolutely fails to satisfy us.

HOYLE'S WAREHOUSE, MANCHESTER.

THIS week we publish the last of our photographs illustrating the erection of the above building. At the time when our first photograph appeared, in March last year, the old building had been simply removed from the site and preparations were being made to excavate for the foundations for the new work. The first photograph was taken on February 27th; therefore, to all intents and purposes, the whole work from start to finish has been absolutely completed in less than ten months. This is a very creditable performance, considering the extremely complicated nature of the work. It should be remembered that the Rochdale Canal runs right under the building, and it was necessary to arrange that the traffic on the canal should not be impeded in any way. It was impossible to use the tow-path or barges for bridging purposes, so that all work had to be placed in position from above. There was also a large lay-by for barges, which has been covered by the new building. Great difficulty was experienced with the foundations generally owing to lamination of the clay and percolation of water. The building is fitted with two hydraulic goods hoists and a push-button lift for passengers. This latter acts automatically and requires no attendant. When it is required on any floor, the button is pressed and the lift comes to the point required, and stops there, the doors opening automatically. The building is heated and ventilated throughout by means of purified air (which can be regulated to any temperature required), and hot water, and is lighted with electric light and gas. All departments are served by pneumatic tube plant and a telephone installation. Each shop takes its water and electric light through a submeter, and each is also fitted with gas- and a sub-meter. The floors, a typical view of one of which is given on the opposite page, are calculated to carry $2\frac{3}{4}$ cwts. per sq. ft. and are of fire-resisting construction. As shown, they are well lighted and clear of interior walls.

Mr. Alfred Cox then read a paper c
"Public Libraries." He did not deal wit
the history of libraries, but with the buil
ings themselves, and more particular
with the smaller class of public library cos
ing from £2,000 to £10,000. After makir
passing reference to books and papers on tl
subject, and to libraries erected through tl
generosity of certain individuals, more esp
cially Mr. Andrew Carnegie, Mr. Passmo
Edwards and the late Mr. Henry Tat
Mr. Cox said:—In the first place, it is
the greatest importance that

A Suitable Site

should be provided for. On this almo
entirely depends the satisfactory plannir
and general economical arrangements of tl
building to be erected on it. It should,
course, have good light around it, and al
be in as central and yet as quiet a positi
as it is possible to obtain. It should be lar
enough to allow of any probable futu

extension of the building to a reasonable degree; but in the case of suburban towns, which spring up like mushrooms and develop at a rate far beyond the most careful calculations, the best solution of this problem will possibly be by means of small branch libraries erected in suitable positions.

With regard to the

General Arrangements of the Plan,

these should, of course, like any other building aiming at satisfactory results, be very simple, and, if possible, all the public rooms arranged on one floor. Often, however, this cannot be done owing to the limitations of the site, and in such cases the more public rooms to which most easy and ready access is required, such as the newsroom and the lending department, should be placed on the ground floor, and the less frequented rooms and those for special study, together with the librarian's office, on the upper floors.

Supervision

is of the first importance, and in planning should be always borne in mind. It is usual to arrange for this by placing the staff-counter in an enclosure connected with the lending department in such a position that the attendants, who are generally at work there the whole day long, can command the main entrance and as many of the rooms as possible. In connection with this it is a mistake to conclude that the librarian is the policeman of the building, his work being of far greater importance than that, although probably in very small libraries he may have to do all the work, with possibly the assistance of a youth. He should be in a position near his assistants, but it is not necessary to place his room in a prominent position as regards the public.

All the public rooms should be lofty and well-lighted; the ventilation should be especially considered, so that the air can be changed frequently, as at certain times in the day these rooms are often crowded, and any feeling approaching to stuffiness is most unpleasant, besides being unhealthy for the readers; moreover, it renders the work of the attendants who are there always doubly trying.

Architectural Treatment.

A free public library, as a rule, has to be completed for a sum that allows little for architectural splendour, but the requirements, being generally very simple, lend themselves admirably to a successful and dignified treatment, provided the designer confines his attention to such vital matters as good proportion and simplicity, with suitable details of whatever style he may adopt to emphasize them, and not be carried away by any unnecessary feeling that the building wants breaking up somehow. This breaking-up, as a rule, is quite superfluous to the real requirements of the plan, embracing very often as it does bay windows and odd corners, neither of which are happy features in the public rooms of a free library, and is but too often the amazing conceit of the pencil as opposed to the common-sense of the india-rubber.

After all, the public library is, or should be, a local centre of culture, and, apart from the books, the building itself should be of such a character as to elevate the minds and educate the public in the art of architecture, and make them feel that they are in a place which inclines them to improve their minds and morals in every way. I am afraid library committees often overlook this, and disregard the real and good in architecture in favour of the more showy on paper, which often masks an ill-arranged plan; the former being looked upon as a sort of joke, and likened to a stable, a workhouse, or any other building which they do not associate with architecture, but think merely bricks and mortar; whilst the latter, exhibiting all the tricks of draughtsmanship to illustrate the commonplace, is loudly appraised.

I will now give you a more detailed description of the internal arrangements of a library, though I think these are pretty generally known; however, the memory cannot be refreshed too often, and possibly if most of it is forgotten some of it will stick and prove useful in the future.

The Entrance

should be spacious, and open into a good-sized hall or broad corridor, which lend themselves to be particularly studied as the architectural features of the building. First appearances go a long way, and I should always endeavour to make the entrance attractive.

From this hall as many of the rooms as possible should be directly approached; the more-frequented rooms, as I mentioned before such as the news and lending rooms—being, if possible, nearer the entrance.

The Lending Library.

The counter or enclosure of the lending library should be conspicuous on entering, and, to my way of thinking, is better entirely open than having to pass through swing-doors to reach it.

HOYLE'S WAREHOUSE, MANCHESTER: TYPICAL FLOOR.
(Photograph taken on November 20th, 1904.)

The lending library should be arranged so as to be worked either by the indicator system or by a more recent method known as the "open access." In the former case there must be a long counter for the indicators, with issue spaces in between them The amount of space occupied by the indicators varies from 35ins. to 10ins. for each 1,000 numbers, according to the particular type adopted. The counter should be somewhere about 32ins. high, so as to allow children and people of small stature to clearly see the top numbers of the indicators. The length of counter would be determined by the number of indicators in use, and a sufficient allowance should be made for possible extensions. As regards the issue desks, two, each at least 3ft. wide, should be allowed to every 10,000 volumes. Good light on both sides is very necessary, so that the public on the one side and the attendants on the other have no difficulty in reading the numbers. In the case of the "open access" system, there must be an enclosure of ample size at the entrance to the lending library. Bookcases should be arranged "end on" to the counter or enclosure and in close proximity to them.

The stackroom might be made high enough to take two or more tiers of bookcases over the lower ones by having a light floor of perforated iron gratings between them. These floors would be reached by a straight staircase of about 3ft. 6ins. minimum width. A circular staircase is not desirable. A book-lift in a well-considered position is of course essential where there are more than one tier. With regard to bookcases, these are about 16ins. for a double one (that is, for books on both sides), the height being anything between 7ft. and 8ft., and often a step is provided so that short people can more easily read the upper shelf. Wooden shelves are generally $\frac{7}{8}$in. thick and should not be longer than 3ft., as anything more than that is awkward to use, and liable to sag. Wooden shelves have a better appearance than iron, and are cheaper, and if corners are rounded they do not damage the bindings of the books so much.

Iron shelves are of course more fire-resisting, but unless the whole building is made absolutely fireproof there is no real advantage in them. The bookcases should not be at a less distance apart than 3ft., otherwise it is difficult to stand far enough back to see the upper shelves and at the same time allow people to pass. In the case of the "open access" a greater distance still should be allowed, and 4ft. taken as a minimum. All counter-tops should be of polished hardwood, floors as noiseless as possible—wood blocks or cork carpet being generally used—walls with glazed brick or tile dados in public rooms and lobbies, heating by coils on low-pressure system with a sectional independent boiler, inlets behind radiators and grids in the ceiling.

The Reference Room,

being used by students and readers of more serious books, would necessarily be placed in the quietest part of the building, and in such a position where it would be unnecessary to be passed by people going into the other rooms. I suggest as a good place for it within the lending library counter, so that readers—as a rule there are not many—could pass into it through a wicket gate, which would be under the control of the attendants. The books, too, in this room, being of more value, are thus afforded better protection, and the attendants know who the people are that pass into the rooms.

In the case of a small library, a space for a table to be used by reference readers might possibly be arranged in the lending library itself by arranging the bookcases in a suitable manner, and I think in many cases this would give all that was required.

In some buildings a separate room is provided for juvenile readers, and great care must be exercised in planning so as to put this in a position near the attendants, and also where the occupants cannot make themselves a nuisance to the other readers. A separate entrance from the street is sometimes provided for this room, but I do not think it is a good arrangement, as, among other things, it makes an easy escape for the mischievous youngster after "cheeking" the attendants, and has many objections.

One Main Public Entrance

for all parts is the simplest, and gives better control than where there are more. In a library building of ordinary size I do not see why the principal entrance should not open into a large space, which could be subdivided by arches or columns with balustrades, so as to group the various readers into the usual sections — magazines, news, lending, &c. Surely one person reading a newspaper and another a magazine can do so without having a solid wall or even a glazed partition between them. This arrangement would give excellent control, and there would be no annoyance caused by such small matters as the opening and shutting of doors. Of course, great care would be necessary to exclude draughts, but I can see no difficulty in this any more than in a building of a larger area.

The Librarian's Room

is well placed on the counter enclosure side of the lending library. It need not have any direct communication with any of the public rooms; in fact, it is an office, pure and simple, where the occupant has much work to do without being continually worried in the control of the public using the library. This room is often used for the meeting of the library committee. With regard to the

Lavatory and Water-closet Accommodation

for the public, this is sometimes provided, but in a small library I think it has many objections, and is liable to be a great nuisance. Of course, it is necessary to provide for the staff, and in many cases for both sexes, as female assistants are now very commonly employed.

Store-room, Workroom, Librarian's Residence.

A good store-room and workroom and a mess-room for the staff should also be provided within easy access of the lending library, and a separate entrance for delivery might be arranged in connection with these rooms. In many libraries a residence for the librarian is arranged, and suitable accommodation for it is to provide two sitting-rooms, kitchen, scullery, pantry, with three or four bedrooms, bathroom, &c. In other cases the caretaker will only live on the premises, and in his case the provision of a kitchen with scullery and pantry, a living-room and two bedrooms and a bathroom should be sufficient.

With regard to the

Style of the Rooms

themselves, the larger ones should be treated as small halls rather than rooms, and the satisfactory lighting of them must be carefully considered. Good lofty rooms with windows high up, and where possible opposite to each other for cross ventilation, is a good arrangement; the height of sills from the floor line being about 5ft. up in the newsroom and lending library, so as to allow newspaper slopes and bookcases to run continuously round the walls. In the other rooms the ordinary sill height is preferable. Personally, I do not like the appearance of either skylights or lantern lights—they tend to make a room anything but cheerful, and the idea of not being able to see out at all is objectionable. Of course, in certain cases it is difficult to do without them, but if possible always try hard to avoid them; at all events for your main lighting. They are also unsightly things on the outside, and rather make a building look like a hotel billiard-room or swimming bath. In a small library rectangular rooms would be the best and most economical for furnishing. Bay windows and odd corners are wasteful, and not easy of supervision. Unless there is anything against it, clear glass is preferable for the windows, and if any coloured glass be used, let it be done sparingly and be of the best quality.

Some Notes by Maurice B. Adams.

Some notes on Mr. Cox's paper were read by Mr. Maurice B. Adams. After referring to Mr. Cox's libraries at Kingston-on-Thames and Wakefield, Mr. Adams observed that in all specialized work like that of libraries it was essential for the architect to cultivate a more or less intimate acquaintance with its process of contemporary development. The library to-day was already in a transitional stage, emerging from comparative obscurity to the full recognition of adequate importance long enough ago accorded to it in America.

Continuing, Mr. Adams said a library should be made to look just like what it really was—not a school, nor a house, a town hall and offices, nor a church! Often the special characteristics of the building were masked by too close an adherence to traditional architectural lines, instead of allowing the particular needs of the interior to determine the exterior treatment. Mr. Cox had alluded to the effect of skylights and their likelihood to make a library resemble a public bath, or perhaps a billiard-room. In parentheses Mr. Adams observed that, quite apart from appearance, roof lights were open to several objections in a library, and especially if no ceiling lights were also provided: they were noisy during heavy rain, and were too subject to variations of temperature, causing down-draught, as well as difficulties in keeping them water-tight. Ceiling lights also became very dusty and needed provision for easy cleaning. Mr. Adams said he much preferred vertical dormers and lantern lights—they aided ventilation better, and, at least, were capable of architectural treatment. Still, skylights had to be employed at times, and by preference one put them on the rear slopes of the roof, out of sight. Where no choice was left, and they had to be located where they otherwise would be conspicuous, he thought they could be masked by good tall parapets, because such sloped lights need not be near the ridge. This idea of a parapet implied a cornice, and that in turn indicated a monumental façade necessitating a more than usual breadth of handling and scale.

Then, again, Mr. Cox had intimated that angles, bays and projecting features had a tendency to break up designs needlessly and obstruct supervision, which, in a way, was perfectly true. And, further, he had suggestively dilated on window contrivances. Everyone knew that windows placed low down in libraries wasted internal wall-space and encouraged loafing, which constituted one of the bug-bears of modern reading-room work. Then added to the possibilities of fenestration arrangement there was ample scope for inventive skill in the management of the main entrance to the library. Lastly, however, and dominating all these details, was the primary advantage of facility of supervision, always and only to be ensured by making all the public rooms on one floor. Consequently the general outline of an ideal library, where the site allowed this arrangement, should be comparatively low in proportion, with a spreading plan.

For style, the late Renaissance appeared best adapted to present-day needs. As to the architectural treatment of reading-room interiors by arcading and intercolumniation, opening up the whole series of apartments into one large undivided whole, no doubt the lecturer's suggestion possessed the merit of ambitious possibilities, but the vast majority of librarians preferred separate rooms for newspapers as distinct from magazines.

Mr. Cox had not mentioned the essential differences of the open-access library as contrasted with the indicator system—a very crucial point of the utmost consequence. He had, however, suggested apparently in any case that the reference-room entrance should be behind or within the lending library counter. This plan, Mr. Adams thought, was open to the objection that when the issue of books closed on certain evenings of the week no one would be able to use the reference-room without exposing the stackroom to intrusion, and it was most desirable to keep the reference-room always open for access to directories and other reference books usually kept in these apartments, and, of course, for reading the heavier monthlies and quarterlies. As to the further observation about permitting the reference-room readers to have a table in the lending library stackroom, and group the bookcases suitably for the purpose, it would be hardly possible to discuss that point without opening up the whole question of library administration, which, to a considerable degree, depended on the burning problem of rate-aid *v.* State-aid, and it also touched the crying need of reference-room development.

Discussion.

Mr. Henry T. Hare said that although a library was one of the simplest buildings, still in some senses it was one of the most difficult to plan. He doubted whether it was possible to secure an absolutely satisfactory plan, even with a perfectly free site. One of the chief requirements was that there should be complete supervision of all parts. Yet there appeared to be much confusion of idea in regard to this. The common idea was that the supervision was done by the staff: so that in most plans the several rooms were grouped around the reference-room. As a fact, however, the supervision was done by the porter, who walked from room to room, the staff being usually occupied with other duties. If this fact were remembered, matters would be simplified. The real solution of the problem would be to do away with all separate rooms, and the most satisfactory plan for a free library would be one great hall. In his opinion there was no necessity for an entrance hall. One should enter the library direct from the street, though double doors could be provided if thought desirable. The lending library was not bound to be on the ground floor. Most people went into the news and magazine rooms, and the lending library was generally only open on certain days and at certain hours. The reference library was usually upstairs, and it was an advantage to place the lending library there too. All the books could then be brought together under the direct control of the same staff. The ground floor could be devoted to the news and magazine rooms, which would be supervized by the porter. The only difficulty in adopting such an arrangement was to get rid of the staircase; he thought, however, this could be overcome. Most library committees seemed wedded to the idea of a caretaker's house being included, though one could be rented outside for about a quarter the cost. Speaking of indicators, Mr. Hare said librarians generally had an exaggerated idea as to the size of these; there was no necessity to indicate every book in the library; in a big library, even, an indicator for 5,000 or 6,000 books was ample.

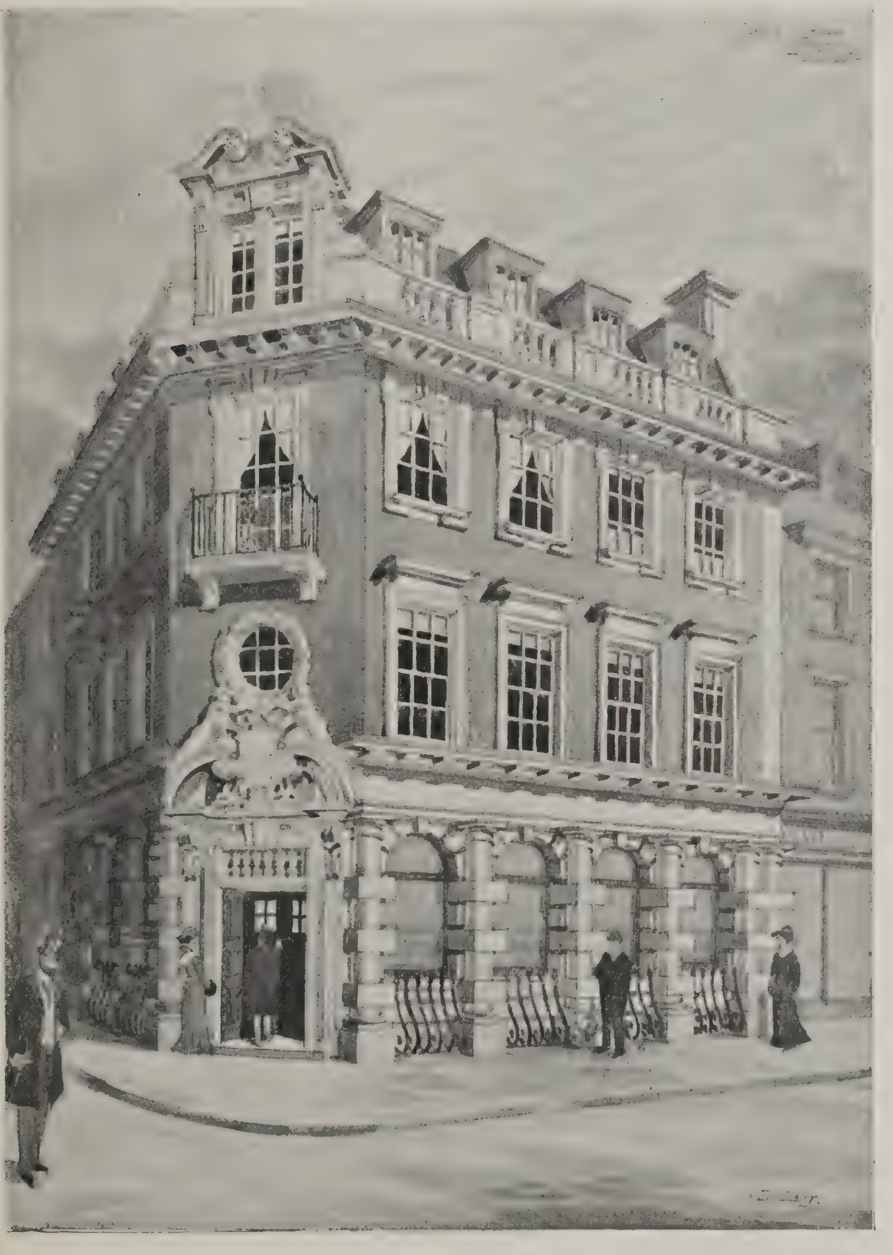
Mr. S. D. Adshead said that, in theory, the "open access" system was the best, but in practice the indicator was: under the "open access" system the books were injured and constant supervision was necessary, and this sometimes became quite a nuisance; in poor districts the "open access" system was out of the question. As to the general type of plan for a library, he favoured one large room, though he saw no objection to employing division screens in order to avoid confusion—in any case the reference-room should be kept separate, and as quiet as possible. The provision of lavatory accommodation depended on the position in which the library was situated and the class of people using it; in some cases such accommodation was very useful, while in others it became a nuisance. Top-lighting, in his opinion, was desirable, but some side windows should also be provided to secure proper ventilation. In newsrooms it was better to have slopes around the walls rather than stands, as the latter caused dodging and blocked up the room. The walls of the reference library were best lined with books, and if need be the lending library might be restricted for this purpose.

Mr. Sydney K. Greenslade spoke of American libraries and their general superiority over those here. All the rooms were practically exposed to the counter. Children's rooms were a feature. As a rule, the smaller libraries comprised four rooms, namely, a central entrance hall, a room on either side, and a stack room at the back, with space for the attendant. In many American libraries the lending department was upstairs. In the great national library at Washington there was provision for 3,000,000 books, housed in enormous rooms called "stacks," having steel frames and shelves of steel with rounded edges and slots for dust to fall through and for ventilation. In this country, he said, we were far behind America in the erection of libraries. There they did things on a better scale. Why, at the British Museum, the present scheme of enlargement seemed to be a muddle; the day would come when the Government would have to settle whether the institution was a library or a museum.

Mr. Taylor next spoke, after whom Mr. Arthur Keen referred to the fact that Sir John Soane's interiors (which were among the most successful) were hardly ever lighted from the side: at the Bank of England all the big rooms were lighted from lantern lights or domes with eyes.

Mr. Dawber agreed with Mr. Adshead that lavatory accommodation for the public was overdone. In many cases it was quite unnecessary and only led to abuse.

The president announced that the next meeting would be held on January 27th, when Messrs. J. B. Fulton and E. F. Reynolds would read papers on "Byzantine Architecture," at 7.30 p.m.



BANK AT NOTTING HILL, LONDON, W. NASH AND DETMAR, ARCHITECTS.

This building was completed last year for the London City and Midland Bank. The drawing shows the original design for rebuilding, but owing to circumstances this had subsequently to be modified. The materials are red bricks and Portland stone. The internal fittings and screens were executed by Messrs. Waring and the electric-light fittings by Messrs. Durtnall & Pries. Messrs. E. Lawrance & Sons were the contractors.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Book on Nonconformist Architecture.

ROTHERHAM.—DISSENTER writes: "In a recent issue of the 'Methodist Recorder' Messrs. Crouch & Butler, architects, Birmingham, were stated to be the authors of a volume on Nonconformist architecture. Can you give any particulars of this book?"

We have never heard of it.

Architectural Assistants in the Colonies.

ARCHITECTURAL ASSISTANT writes: "What are the prospects of an architectural draughtsman in the Victorian Colonies, say Dunedin, Wellington, Christchurch, Melbourne and Sydney?"

There is not much opening in Australia; New Zealand is far more promising, all reports we have had indicating that the building trades are very active in every centre there.

Chimney Pots and Flues.

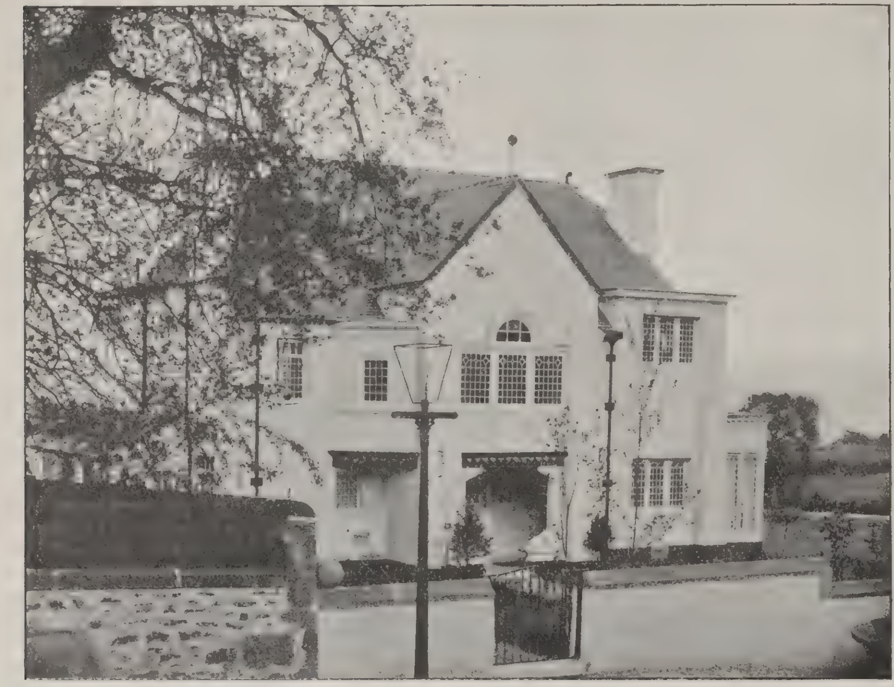
BLACKBURN.—H. C. writes: "Is it beneficial or otherwise to partly choke a chimney flue by placing a circular pot on a square flue? What shape of pot is best for a 14in. by 9in. flue? Some people think the narrowing of a flue at the top quickens the draught. Is this really so? Having a chimney coping pierced for a circular pot to a 9in. by 9in. or 14in. by 9in. flue, should the brickwork below be narrowed so as to reduce the flue gradually, or should it cut off suddenly by just placing the coping on the full width flue?"

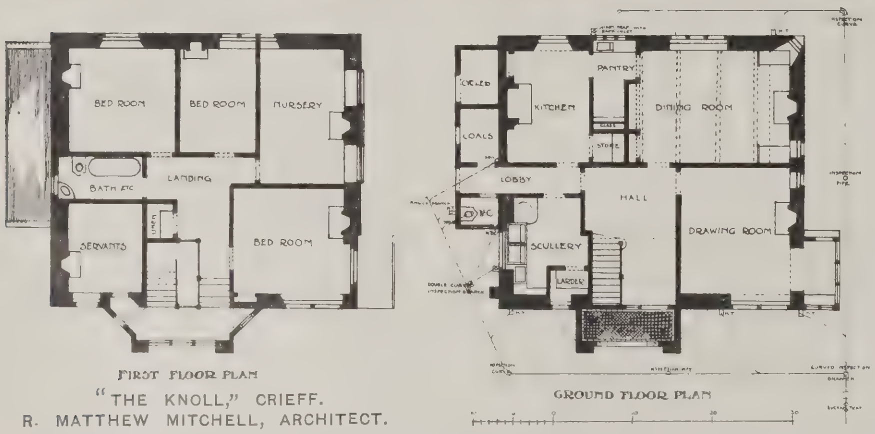
A flue should not be narrowed towards the top. The quickness of the draught depends upon the cubic capacity of the chimney, and any narrowing restricts the draught. The pot should be of equivalent area to the flue.

Reinforced Concrete.

CARDIFF.—G. A. B. writes: "On p. 335 of your issue for December 21st you mention a M. Coignet opening a branch in London, thus adding one more name to the increasing list of contractors for this kind of construction in this country. Please give names and addresses of firms who erect buildings with reinforced concrete."

The following English firms execute reinforced concrete work:—New Expanded Metal Co., Ltd., York Mansion, York Street, Westminster; Stuart's Granolithic Stone Co., Ltd., Glengall Road, Millwall Dock, E.; Columbian Fireproofing Co., 37, King William Street, London; Fireproofing Co., Ltd., Waldo House, York Buildings, Adelphi, W.C.; A. E. Williams, A.M.I.C.E., Dagenham Docks, Essex; Homan & Rodgers, 17, Gracechurch Street, E.C. The following are English agents for various foreign systems:—Hennebique system, L. G. Mouchel, 38, Victoria Street, Westminster; Coignet system, G. C. Workman, 43, Chancery Lane, W.C.; Cottancin system, A. Vye-Parminter, 27, Avenue des Acacias, Paris; Klett system, F. H. Rudolph, 68, Victoria Street, Westminster; Koenen system, R. B. Roxby, 18, Featherstone Buildings, Holborn, W.C.; Maciachini and Visintini systems, C. H. Reynolds, Clevelands, Teddington; and Monier system, H. C. Werner, 4, Westminster Palace Gardens, Artillery Row, S.W.





FIRST FLOOR PLAN

GROUND FLOOR PLAN

"THE KNOLL," CRIEFF.
R. MATTHEW MITCHELL, ARCHITECT.

This house is built of rough rubble harled on the outside, and covered with Collier's tiles. All the internal finishings and fitments are carried out in selected American cypress, which lends itself exceptionally well to staining purposes. The stained and leaded glasswork in the casements and doors was executed by the British and Foreign Glass Co., Glasgow.

Heating a Church.

IPSWICH.—J. H. C. writes: "The accompanying plan (not reproduced) shows the heating apparatus of a church, which is quite a failure although there is a good saddle boiler. Pipes rise 1in. in 10ft., and the circulation seems fairly good, but even after a fire for twenty-four hours there is not more than 2 degs. more heat in the building. The pipes are 4ins., laid in very narrow trenches, with 6ins. perforated gratings over. It seems to me that the whole of the heat is absorbed by the ground, being so close to the pipes. Could you suggest an alteration that could be carried out cheaply? Could the pipes be packed and radiators or coils worked from them? I think the boiler is large enough and has a good draught."

The height of the church is not given, but if it averages 18ft. the cubic contents of the building is nearly 50,000ft. If the worshippers are numerous and fill most of the seats, an allowance of 5 sq. ft of pipe surface to each 1,000 cub. ft. should be sufficient; but if they are few, 6 to 1,000 will be needed. The surface of the pipes now laid is about 190 sq. ft., and this is not enough for 50,000 cub. ft., even if the pipes were in the open or in a wide trench instead of a too narrow one. The trench should be twice as wide as the pipe. The cheapest way to amend the apparatus is to fix coils or radiators along the passages at the pew fronts and backs, as indicated; those near the doors being fixed, if possible, to catch the wind that blows in when the doors are opened. If coils are chosen the pipes should be small, 2in. or 2½in. bore, or at most 3ins.; and radiators should be long and not high. The circulation may be reversed by this extra heating surface, though I do not expect it to be. Valves will not be needed, but the expansion and filling cistern may have to be re-fixed at a higher level than the topmost point in the coils or radiators. O. WHEELER.

Surveying Levels.

TEDDINGTON.—K. J. E. writes: "What are the advantages and peculiarities of the dumpy-level over the ordinary level?"

The form of level now in ordinary use is the dumpy. The Y-level is now rarely seen. Any text-book on surveying would explain the differences between these instruments, both in construction and use, while such an explanation would occupy several pages of THE BUILDERS' JOURNAL and need to be very fully illustrated. You would do well to get either Middleton's "Surveying and Surveying Instruments" or Whitelaw's "Land Surveying." M.

Tour around Lincoln, Peterborough, &c.

ROCHDALE.—STUDENT writes: "I intend making the following places centres for a touring holiday next summer, and shall be glad if you can tell me of anything of special architectural interest in the immediate vicinity (say within a 4-mile radius): Lincoln, Peterborough, Ely, Cambridge, Oxford and Lichfield. Are there any abbeys near these places? What is the nearest railway station to Kirby Hall, and are there any places near where one could put up for a day or two?"

Besides the cathedrals in the above-named places, the following churches and buildings are of interest:—St. John's, Lincoln, and the church at Burton; Peakirk, near Peterborough; Cambridge: St. Mary the Great, St. Sepulchre's, King's College Chapel, Trinity College Chapel, St. John's and Trinity churches, and the churches at Barnwell and Cherry Hinton. Some Elizabethan work is to be found at Caius, Sidney Sussex, Trinity, Clare and St. John's colleges, while Wren also did some work at Trinity College Library. Oxford: St. Giles, St. Mary the Virgin, St. Michael and St. Mary Magdalene churches, Sheldonian Theatre, Bodleian Library, and All Souls, Magdalen, Merton, New and Trinity colleges; while there are beautiful churches at Iffley, Begbroke, Cassington and Handborough. At Lichfield, St. Michael's Church should be seen. Kingscliffe would be the most convenient station for Kirby Hall if travelling from the east, and Gretton if from the west. There are a few villages in the vicinity where you could probably put up for a few days. The programme you have laid out is absurd unless you can give at least six months to it, and even then the greater part of your time could well be spent on the cathedrals alone. G. A. T. M.

Civil Service Surveying Department.

LINCOLN.—W. C. B. writes: "Which are the most useful subjects to be coached in when studying for Civil Service (Surveying Department)? Where can text-books be obtained?"

You should first write to the Civil Service Commissioners, Burlington House, London, W., and obtain particulars of all the examinations for Civil Service appointments in which surveying is a subject. Next discover which of these suits you best. You will find that these examinations vary very considerably in the subjects taken and in the prospects they offer to the successful competitor. It would, therefore, be the best plan for you to write to one of the Civil Service tutors whose advertisements may be found in this journal, stating either the examination in which you intend to compete or detailing your knowledge and experience in order that he may advise you concerning your best course of study. The question of books is one which must be kept until you have decided what examination you intend to take, and if you place yourself in a tutor's hands his advice should be followed. M.

Fire Tests.

HACKNEY.—UNCERTAIN writes: "What is the approximate heat to which fireproofing materials for walls, partitions or ceilings are subjected by any particular associations or bodies who undertake tests?"

About 2,000 degs. The British Fire Prevention Committee undertake such tests.

Payment for Additional Brickwork.

LONDON.—E. T. T. writes: "I agreed to take down and rebuild a part of two fronts (top floor) similar to two adjoining, previously done, which consists of 9in. brickwork. The two I have done are 14in. brickwork, and the surveyor will not pay for the extra 4½ins. Can he be made to pay?"

This depends almost entirely upon the wording of the contract. Of course, if the surveyor prepared plans and specification of works, he is liable for the extra cost of the additional walling; but if, on the other hand, you, after viewing the premises, undertook to take down and rebuild the two fronts at a certain price, I am of opinion that you are supposed to have known what you were doing and must bear the cost. F. S. I.

THE BUILDING TRADE IN 1904.

WE are unfortunately again compelled to chronicle a general depression in the building trades during the past year. 1901, 1902 and 1903 were bad years, but 1904 was still worse. The trade of the country has been passing through a cycle of depression, and the building trades being dependent thereon are naturally adversely affected. Tightness of money prevents the erection of speculative property. Municipal enterprise in contracting work has disturbed the market and checked individual effort by the placing of large loans, thus affecting gilt-edged stocks and withdrawing from speculation very large sums of money which would otherwise be invested in profit-earning concerns. Members of corporations, unlike individual traders, have not to bear the personal responsibility of their financial operations; deficits are met by fresh loans and by raising rates on property, thus placing another check on commercial enterprise so far as the builder is concerned. Materials have become cheaper. Of course there is always at this season a large number of unemployed, but the proportion this year is larger than in former years. The Board of Trade returns point, however, to an improvement in the general trade of the country, which augurs well for the future, but the building trades are bound to follow somewhat tardily because they will have to wait until the public recover from the strain.

London.

The building trade in London has suffered severely, though of course in a large city there is always much work going on. The speculative building of small houses has been diminished and commercial premises are also a backward feature. The rebuilding of Central London continues to make rapid strides.

Bradford.

The building trade in Bradford has been very depressed during the past year, and especially in the last few months. It is stated that the depression has not been so acute for nearly twenty years past. Amongst local builders the belief prevails that practically all classes of houses have been overbuilt. There is not a particularly sanguine feeling as to the prospect of better conditions in the immediate future. The local stone trade has not been so good as in recent years. Prices have fluctuated a good deal during the year, and have had a tendency to lower rates than last year. The London trade also has slightly fallen off.

Darlington.

The position of the building trade has been somewhat worse during the past year than in 1903, partly attributable to overbuilding during the previous good years. There has been an absence of speculative building.

Darwen.

Trade has been very bad during the past year. Only 169 sets of plans for new buildings of every class have been deposited, the lowest number for many years. No plans for new public buildings or schools have been deposited, although there have been minor extensions of the latter. Only 116 new houses have been erected; this is slightly below the average of the past four years, and somewhat more than one-third of the number erected six years ago.

Leeds.

During the past two or three years the depression in the building trade has been most acute, it being realized last year that it would be hardly possible for the trade to be in a worse state. It was anticipated that after a protracted period of slackness trade would revive, and the new year was confidently looked forward to in the hope that the condition of things would materially improve. Very little improvement, however, took place, and if possible the state of the trade was worse at the end of the year than it was twelve months previously. In fact, it is stated that it was never known to have been so bad. Overbuilding has been going on for a long time, and as a consequence prices have ruled low. Very little speculative building has been done during the year. Quarryowners have experienced a great slackness in trade and brickmakers have been "stacking" for some time past. A better condition of affairs is looked forward to in the future, a number of large contracts being in prospect.

Leicester.

Here again the trade has been depressed. Since 1898 the number of plans passed by the Corporation diminished successively from 3,901, 3,456, 2,914, 2,529, 2,311 and 1,925 to only 1,785, or to less than half the maximum of 1898. The slump has occurred chiefly in houses. Since 1898 these have fallen from as many as 2,404 to but 865.

Liverpool.

Trade has been fairly brisk.

Manchester.

The year is stated to have been one of the worst that has been known in the building trade for over thirty years. There has been less ordinary competitive building in the city of Manchester and the district round about than has obtained for a generation. Since the beginning of 1904, 778 sets of plans of buildings have been submitted to the Corporation, and of these 704 were passed. In the same period 1,525 dwelling-houses were certified as fit for habitation, the lowest figure recorded since 1895, when 1,088 were built.

Newcastle.

There has been considerable activity in the Newcastle building trade, the development of outlying estates for residential purposes, not less than the transformation of central out-of-date premises into modern shops, warehouses and offices, being continued with much enterprise. The progress made in the rebuilding of the centre of Newcastle is steady.

Newport, Mon.

A considerable impetus to the building trade of Newport is opened up by the laying-out of new streets on the Eveswell estate.

Nuneaton.

Although trade during the year has been bad throughout the country, the Nuneaton Council were called upon to pass plans for 345 dwelling-houses, and nearly half a mile of new streets was laid out.

Portsmouth.

Last year 800 houses, more or less, were built within the borough limits. New building by-laws were adopted, and immediately after they came into force there was a falling-off in the number of plans submitted.

Salisbury and Amesbury Districts.

During the past twelve months there has been much activity in the building trade in Salisbury. Many important blocks of business premises have been completed. Estates are being developed on the old Castle Road and another has been started near Wilton. There has been much demand lately for villa residences in the Salisbury district owing to the city having become a business centre for the camp at Bulford.

In the Amesbury district much building has been pushed forward and a large estate at Durrington, a village three miles distant, is being developed to accommodate persons connected with Bulford Camp.

Sheffield.

Here there has been depression, though the building trade has not suffered so severely from the unsatisfactory condition of business as have many other branches of industry. In 1903 the plans deposited with the city surveyor for buildings of various kinds numbered 1,296, and for the twelve months just ended they reached 1,194. In 1903 the houses shown on the approved plans were 2,338, and other buildings 420, while during 1904 the houses numbered 2,324 and other buildings 757.

Shipley.

The year 1904 has been on the whole a moderately prosperous one at Shipley. The stone trade is perhaps the least satisfactory of all branches. A good deal of building has taken place during the year, especially of houses of the semi-detached villa class.

Stockport.

The building trade in Stockport has been greatly depressed during the past year.

Sunderland.

Plans for 478 new buildings were passed last year, which is evidence of the rapid growth of the Wearside borough.

York.

Building diminished considerably during the year. In 1903 there were 238 plans for dwelling-houses approved during the year, as against 194 last year. Of the above dwelling-houses the number completed during 1903 was 328 and 64 during 1904.

Aberdeen.

The number of plans sanctioned was the lowest for many years past, and the trade was depressed.

Dundee.

Trade has experienced one, and the worst, of a succession of lean years. In every department there has been depression and hard times both for masters and men. While the prospects for the ensuing year cannot by any stretch of imagination be described as bright, it is undoubted that a better feeling prevails, and that there is a disposition on the part of the trade to believe that the lowest point in the scale of depression has been touched, and that in the next twelve months the business will show an improvement on the past two or three years.

Leith.

The trade in Leith during the past year was anything but brisk.

Perth.

The building trades in Perth have not suffered to any great extent the severe depression that has been felt in other populous centres.

Edinburgh.

Taking trade union statistics as the basis for estimating employment generally, it is found that the building trade has not been in such a depressed state since after the failure of the City of Glasgow Bank in 1879, when employment of builders touched the lowest point. Throughout the summer there never was less than 25 per cent. of the bricklayers idle. Although the work passed through the Dean of Guild Court during the year has numerically and financially been greater than the previous year, yet the depression in the building trade has been undoubted, and the explanation is partly that about 40 or 50 per cent. of the work passed through the Court has not been in operation, partly owing to the want of purchasers.

Belfast.

The building trade during the year shows some little improvement upon the previous year, although it has still been less satisfactory than could have been wished. In the beginning of the year large contracts were scarce, but afterwards things improved.

PORTLAND CEMENT.—II.

Some Notes on its Manufacture and Testing.

By H. K. G. BAMBER, Managing Director, The Associated Portland Cement Manufacturers (1900), Ltd.

(Concluded from p. 6 of No. 517.)

THE chemistry of Portland cement has been and still remains a very abstruse subject. A considerable amount of research has been made from time to time by various chemists, whose results throw some light on the matter, but there yet remains a wide field of research for the scientist and manufacturer before the whole truth will be known.

The following shows the chemical composition typical of the bulk of cements in use, the sample being taken when fresh ground.

Analysis.

Silica (SiO_2)	22·00
Insoluble residue (sand and insoluble silicates)	·75
Alumina (Al_2O_3)	7·60
Ferric oxide (Fe_2O_3)	3·55
Lime (CaO)	61·90
Magnesia (MgO)	1·25
Sulphuric anhydride (SO_3)	1·50
Carbonic anhydride (CO_2)	·25
Water (H_2O)	·75
Potash (K_2O) Soda (Na_2O) and loss	·45
	100·00

The percentage amounts of the various ingredients will of course be somewhat changed if such cement is subjected to prolonged aëration, when the amounts of carbonic anhydride and water will be found to have much increased by absorption from the atmosphere, with a consequent diminution in the percentage quantities of the other ingredients. For this reason, in cases where the percentage of lime present is fixed by specification, the amount found on analysis should be considered absolutely in conjunction with the amount of matter volatile on ignition, *i.e.*, the water and carbonic anhydride, otherwise it will be clear that an erroneous opinion may easily be formed, leading to a mistaken decision on the quality of the cement, causing annoyance to engineer or consumer and loss to the manufacturer by groundless rejection of the cement.

It frequently happens that disputes arise between the consumer and manufacturer on this point. As an example, a manufacturer prepares some cement to the requirements of a specification which fixes the lime between the maximum and minimum limits of, say, 62 per cent. and 60 per cent. respectively—in addition to other conditions which necessitate the manufacturer working as close to the minimum as possible, say 60·5 per cent. when fresh ground. The cement is prepared in accordance with the specification—delay takes place in the sampling by the engineer—or the sample drawn gets carelessly exposed to atmospheric influence before the analysis is made, with the result that absorption has taken place, the relative percentage of the ingredients is disturbed, and the lime reduced by an absorption of, say, 1·5 per cent. water and carbonic anhydride to 59·59 per cent., and is consequently rejected as being below the minimum allowed, *i.e.*, 60 per cent. For this and for many other reasons that might be cited, where an analysis is specified for any cement, the sample should be taken, if at the works, as soon as possible after the cement is ground, or, if after delivery to the consumer, immediately on arrival; and in either case the sample should when taken be placed in an hermetically sealed receptacle, such as a glass-stoppered bottle, and thus kept free from exposure to the atmosphere till the analysis is made.

Unless such precautions are taken in the case of the sample for analysis, no reliance whatever can be placed on the results of the analysis as representing the composition of the bulk from which such sample was drawn.

It will be foreign to the matter before us to go into the question of methods of analysis, as such matters are not dealt with by the engineer or clerk of works, being delegated to some expert fully acquainted with the proper methods, and whose decision is generally acted upon by the consumer.

For many years the maximum amount of lime permitted by most specifications was 62 per cent., but since the many improvements both in the amalgamation of the raw materials and the more perfect calcination, a larger percentage is advisable, and in cases, as in the rotary process where the clinker is not contaminated with the ash from the kiln, the percentage of lime can be and is beneficially increased up to 64 per cent. in the finished cement. As a matter of fact, 64 per cent. of lime is about the actual percentage in all cement clinker, even when manufactured by the older processes, but during the calcination the ash (chiefly silicates of alumina) from the coke or coal becomes mechanically mixed with the clinker when drawn, and cannot be separated; so that both are ground together, reducing the relative percentage of lime in the finished cement in direct proportion to the amount of silicates of alumina, &c., or ash picked up from the fuel, which in actual practice reduces the percentage of lime from about 64 to 61 per cent., the approximate amount found on analysis in most cements.

The clinker manufactured by the rotary process, as already described, is free from an admixture of fuel ash; and, consequently, although manufactured from raw material of the same composition as used by the older processes, the actual lime present, the whole of which is chemically combined, is presumably though not actually higher than when burned by the older processes, in consequence of the absence of ash mechanically mixed with the old process clinker. No decision, however, can be arrived at as to the quality of cement merely on a chemical analysis, but the data thus obtained is extremely useful in conjunction with results of other tests to be described.

Fineness of Grinding.

As already described, it is customary with a high class of Portland cement to grind to very great fineness as compared to comparatively recent practice, when a cement containing 15 per cent. residue on a 50-mesh sieve (2,500 meshes per square inch) was quite common and considered fine ground.

In ordinary practice to-day the cement is ground so that the whole passes a 50-mesh sieve as just mentioned, but leaving residue as follows:—

50	(2,500 per sq. in.)	trace	per cent. residue.
76	(5,776 ,, ,,)	1 to 2	,, ,,
100	(10,000 ,, ,,)	3 to 5	,, ,,
180	(32,400 ,, ,,)	15 to 20	,, ,,

In making this test, which is purely a mechanical one, care must be taken first to see that the sieve used is made of correct standard wire. It will be readily understood, especially in connection with the very fine sieves, such as the 100 and 180, that the diameter of the wire with which the sieve is woven has an important bearing on the size of the hole: the larger the wire the smaller the hole. If this is not taken into account it will be seen, for instance, that the 100-mesh sieve might really be a finer sieve than the 180 by reason of the larger wire leaving less relative space for the passage of the cement in the 100 than in the 180. The standard usually adopted is that the diameter of the wire for each different sieve shall in each case be equal to half the diameter of the hole—thus for the 76-mesh sieve the diameter of the wire will be ·0044in., corresponding to a total wire width per inch of ·3344in. (76 × ·0044), or one-third of the space—thus each hole with this wire will be twice the width of the latter.

For the 100 (10,000 holes) sieve, diameter of wire ·0032 (100 × ·0032), total width of wire ·32in., as nearly as can be—one-third.

For the 180 (32,400 holes), diameter of wire ·0018in. (180 × ·0018), total width of wire ·324in., again as nearly as possible—one-third.

Sieves of these standards are readily obtainable.

Having a sieve of the correct standard, great care should be taken not to lose any of the residue during shaking, and the operation of shaking should be continued, especially with the finer sieves, until no more residue is coming through, which can be easily seen by sifting over a piece of white paper. The residue is then weighed—not the flour which has passed through, which latter is liable to loss during the operation of sifting.

By continual use, especially if kept in a damp place, the mesh of the wire is likely to become choked with fine cement. More especially is this the case with the finer sieves, in which case, of course, the results are absolutely misleading and incorrect.

Sieves can be cleaned by washing in very dilute hydrochloric acid and afterwards with clean fresh water, and then thoroughly dried.

Most of the disputes from time to time on the question of fineness arise from one or other of these causes, and if the conditions mentioned were followed much friction would be saved.

Specific Gravity.

This test has superseded the "weight per bushel," and is a much more reliable test than the latter. It is not affected by the fineness of grinding, which destroys entirely the value of the weight per bushel test. This test is applied as a measure of the calcination to which the cement has been subjected, as, should there be any considerable proportion of under-burnt or lightly-combined clinker present in the cement, which would be likely to cause unsoundness, the specific gravity would fall below 3·125, which is taken approximately as the standard for well-burnt cement.

This test is also affected, as is the chemical analysis, by exposure to the atmosphere, and in every case the conditions of sampling for the test, as for that for analysis previously described, should be enforced.

As is well known, the specific gravity of a substance denotes the ratio of the weight of any volume of that substance as compared to an equal volume of pure water at its point of maximum density, 4 degs. C. or 39·9 degs. Fahr.

Well-burned fresh cement is 3·125 times heavier than water, but it will be readily understood that if the cement is allowed to combine with varying proportions of water and carbonic anhydride before the specific gravity test is made, there will be a reduction in the relative weight or specific gravity in direct proportion to the amount of absorption. Samples, therefore, should be kept in hermetically sealed vessels.

This test, when required, is usually carried out by the expert engaged to examine and report on the cement, who is of course fully aware of all the conditions under which the test has to be carried out.

When such is not the case, and the test is made at the works, great care must be taken to get reliable results. The method consists of measuring the volume of a given weight of cement in some liquid not affecting the cement. Petroleum free from water is the most convenient medium, but care must be taken to record carefully the temperature of the petroleum and apparatus at the commencement of the operation, and to see that the same temperature is restored before reading the displacement caused by the introduction of the cement. If this is not done, the volume of the cement added to the petroleum will be recorded plus the expansion of the petroleum, or *vice versâ*.

Setting Time.

Here, again, the cement supplied by a manufacturer to a required setting time may vary considerably in the setting characteristics, in accordance with the amount of aëration to which the sample is subjected, and this unavoidable variation due to atmospheric causes is a fruitful source of trade disputes. The cement should, as far as possible, be tested as received.

The method for testing the setting time most in favour is that of the use of a weighted "needle" having a point $\frac{1}{16}$in. square and weighing in all $2\frac{1}{2}$ lbs. The cement is not considered set so long as an appreciable impression is made when the needle is carefully applied to the surface of the pat.

In gauging the pat for this test sufficient water should be used to produce a plastic mass, but care must be taken not to use an excess of water, which would result in a scum on the surface of the pat that would make observation of the real impressions difficult and lead to divergent results.

Many cements, especially those of a slow-setting character, will continue to show faint impressions upon application of the needle long after the actual "setting" has taken place, which will continue until the superficial hardening of the pat prevents any further marking.

In cements of this description experience only can guide one in fixing the point when setting is complete and hardening in progress.

The temperature and humidity of the surrounding atmosphere also plays a not inconsiderable part in the action of the setting of cement. A hot dry atmosphere will tend to more rapid setting. As far as possible a normal temperature of 62 degs. Fahr. and a moist atmosphere should be maintained in the laboratory. Pats should always be made on glass or some other non-absorbent material and kept in such position that undue evaporation of the gauging water is prevented.

Very slow-setting cements frequently show contraction cracks while setting from this cause, the water being evaporated before the chemical action by crystallization is complete, with consequent shrinkage. There is no difficulty, however, in distinguishing between a contraction and an expansion crack. The former, however, is frequently taken for the latter, causing much consternation and unnecessary trouble and anxiety to the consumer and annoyance to the manufacturer, who, having supplied what has been required of him, cannot control the forces of nature. In testing slow-setting cements for setting time it is always advisable to take special precautions against evaporation; the pats when gauged should be covered or placed in some receptacle in which the atmosphere can be kept moist until the setting is complete.

Tensile Strength.

Much has been written from time to time concerning the methods of conducting this test for mechanical strength of cement, but time will not permit of going very closely over the ground.

In the hands of the expert there is little difficulty in conducting the test, but in the hands of the novice the reputution of the manufactured article is everlastingly trembling in the balance.

In the first place it is essential to see that the apparatus and tools to be employed are clean and suitable for the purpose. A mould well greased up or swimming in oil for the purpose of preventing the cement sticking to the mould will often entirely destroy the qualities of the cement placed therein. In filling the mould some quantity of cement, of necessity, falls on and about the same, and as this is always carefully gathered up and packed into the mould to form the briquette the cement so picked up has quantities of oil adhering thereto which thus finds its way into the interior of the briquette and entirely destroys the setting properties of the cement, which, when tested at due dates, fails to comply with the specification.

Care should be taken that moulds are thoroughly clean and free from any excess of lubrication.

Neat Briquettes.

Neat cement for this test should always be taken in weighed quantities, and the water, thoroughly clean, always measured so that a record is available of the proportions constituting the briquette.

Briquettes should always be made singly, especially when the cement is quick-setting. The custom of gauging enough cement at one time to fill several moulds is very objectionable and frequently leads to most unreliable results — the first briquette, and perhaps the second, turn out all right, but the remainder fall short of the required strength, because, forsooth, the cement had commenced to set before the briquettes were finished. The setting of the cement having been thus broken up, the chemical action due to setting is never again thoroughly complete. Again, it is objectionable to use nests of moulds, say four or six, as is frequently done, even if the briquettes are gauged singly, as with a moderately quick-setting cement in the hands of the inexperienced the packing of the last briquette disturbs by vibration the setting of the first of the series, which may have already commenced to set. Again failure—but this time of the first instead of the last briquettes made.

Each mould should be quite separate and distinct, and when filled should be placed where no vibration can disturb it.

Only slow-setting cements escape failure under these two headings in the hand of the inexperienced.

All briquettes, whether neat or with sand, when first gauged should remain in the mould for twenty-four hours and be kept in a damp atmosphere during the whole of that time. They are then carefully removed for immersion in water, in accordance with the requirements of the specification.

The quantity of water to be used for gauging should be that quantity which will produce a plastic condition when the cement is packed in the mould, but care should be taken that the cement is kept in the form of a damp powder until packed into the mould, when slight tapping will so consolidate it as to render it plastic. If the cement is trowelled into a plastic mass before placing in the mould, the air bubbles in the mixture cannot be excluded and a briquette full of air-spaces will result. If packed into a mould, however, in the form of a damp powder, the air escapes before plasticity is reached, and a solid and homogeneous briquette is the result.

The quantity of water ranges from 18 per cent. to 22 per cent., in accordance with the fineness and setting properties of the cement under test, and a trial should be made with one or two briquettes to discover the most suitable quantity of water, which, if not satisfactory, should not be included in the series from which the test records are to be made.

Sand Tests.

For "sand tests" none but the Standard Leighton Buzzard testing sand should be used. This material is readily obtainable and is of such fineness that all passes a 20^2-mesh sieve (400 holes per sq. in.) and is retained on a 30^2-mesh sieve (900 holes per sq. in.). Before use this sand should be tested as to its behaviour on sieves of this description, so that any coarse particles or fine powder may be eliminated.

All the precautions recommended for the making of neat briquettes apply equally when making briquettes containing three or any other number of parts of sand to 1 part of cement. The quantities should always be taken by weight and not by measure. The percentage of water most suitable ranges from 8 to 10 per cent. of the weight of the dry mixture.

The briquettes during immersion should be kept as nearly as possible at an even temperature; great extremes should be avoided.

Briquettes should be broken at the due dates immediately after being taken from the water, and should not be left about to dry before being tested.

Whatever form of breaking machine is used care should be taken that the briquette is placed evenly and squarely in the clips, so that when the strain is applied the pull is even on all parts of the square-inch section and no side strains are set up, the latter resulting in defective fracture and irregular results.

It is important also that the strain should be applied evenly and at a uniform rate. The standard usually adopted provides for the application of the strain at the rate of 400 lbs. per minute: very irregular results will be obtained if care is not taken in this particular.

An average of results of five briquettes, both in the case of neat and sand tests, are usually sufficient for conclusions to be arrived at as to tensile strength. The results, however, of any apparently faulty briquette giving exceptionally low results should be eliminated, as it is evident the fault must be due to manipulation, as, whatever strain the average number of briquettes of the series may be capable of standing, all should do under like conditions.

Soundness.

A great deal has been written under this head, and much useful information is obtainable from works of reference treating the subject of Portland cement. The test is of, perhaps, more importance than any other test to which cement is subjected.

Portland cement used as a constructive material takes a long time to arrive at its maximum strength, and sometimes long intervals elapse after use before defects, if any, begin to show themselves.

The tests for soundness consist chiefly of exposing a set cement to various high temperatures in water, in order to hasten the ultimate results likely to be obtained under various climatic conditions.

Boiling Test.

Many tests of a more or less stringent character have been introduced, the most severe being the boiling test. There are various methods of carrying out this test, but the most rational and severe is that known as the Le Chatelier method.

The apparatus for conducting the Le Chatelier tests consists of a small split cylinder of spring brass or other suitable metal, 30 millimetres internal diameter and 30 millimetres high, forming the mould to which on either side of the split are attached two indicators 165 millimetres long from the centre of the cylinder.

In conducting the test the mould is placed upon a small piece of glass and filled with cement gauged up in the usual way, care being taken to keep the end of the moulds gently together while this operation is being performed. The mould is then covered with another glass plate; a small weight is placed on this and the mould is immediately placed in water at 58 to 64 degs. Fahr., and left there for twenty-four hours.

The distance separating the indicator points is then measured and the mould placed in cold water, which is brought to the boil in fifteen to thirty minutes and kept boiling for six hours. After cooling, the distance between the points is again measured: the difference between the two measurements represents the expansion of the cement, which must not exceed 10 millimetres after the cement has been aërated for a period of seven days.

This is the most stringent test for soundness in use and has an advantage over all other tests, which only record expansion without any means of measuring the amount of same. It errs, however, on the side of severity, as thousands of tons of cement manufactured in the past—which have resulted in splendid work—and much cement that may be manufactured in the future, which may also do good work, would fail to pass this most stringent test.

Cement, however, that will pass this test will pass any other of the many hot tests known to the trade, and must of necessity be of a high-class character, thoroughly well manufactured and such that will give satisfaction under any normal conditions. It is cement of such description which is the aim of the British manufacturer to produce.

———

At the conclusion of the foregoing paper a discussion took place and Mr. Bamber replied to a number of questions put to him by members of the Association. He pointed out how in the case of the ball mill the material was crushed between the rolling balls, the crushed material passing through the perforated plate which carried the balls on to a protecting sieve through which that portion fine enough passed to the final sieve on the periphery of the mill, the quantity fine enough to pass this latter sieve being thrown by the action of the mill into the hopper in which the mill was enclosed, from which it was conveyed automatically to the tube mill for final grinding; the residue which passed through the perforated plates, and was not sufficiently finely ground to find its way through the external sieve, being returned automatically for regrinding. The tube mill was not set on an incline but perfectly level; the outlet for the finished cement was lower than the inlet for the cement being received from the ball mill, and the action of the stones as the tube mill rotated prevented the cement (which was introduced into the mill by means of a feed screw) from heaping up at the point of inlet, the rotation of the mill and the rolling of the pebbles causing the cement fed into the tube to find its way through the interstices between the stones and the grinding plate to the outlet end of the mill, the cement in its passage from point to point (a distance of about 26ft.) being subjected to the attrition between the stones and the lining of the tube mill, and reaching the outlet end in a condition of fineness as desired—any variation of fineness that might be required being obtained by regulation of feed delivered to the mill for grinding. With regard to wastage of the pebbles and the effect they might have on the cement, Mr. Bamber said the wear in this respect was infinitesimal.

In reply to a question with respect to the mixing of the raw materials, Mr. Bamber said it was found preferable to use all chalk by measure and clay by weight (both in trucks).

In reply to questions as to a ready or rule-of-thumb method that a clerk of works might adopt to form a fairly accurate opinion as to the quality of cement required for immediate use, Mr. Bamber said that under like circumstances he would turn his particular attention to three points: (1) Immediately on receipt of the cement on the work he would test it for fineness (purely a simple mechanical operation); (2) setting time, following the method described in the paper; and (3) he would submit one or more of the pats twenty-four hours after being made to hot water test, placing them in any convenient receptacle in cold water, bringing the water gradually up to a temperature of 180 degs. Fahr., or thereabouts, and maintaining that temperature for three to four hours, and if the cement was sound under these conditions he would feel perfectly satisfied that it would give reliable results in the work. Having satisfied himself on these three points, he would give special attention to the quality and condition of the material which he was going to mix with the cement, as it frequently happened that faulty work was due rather to the material mixed with the cement than to any peculiar property which the cement might be alleged to contain.

THE GERMAN CEMENT INDUSTRY.

Report from the British Consul-General at Hamburg.

SIR WILLIAM WARD, British Consul-General at Hamburg, has sent home a very interesting memorandum on the German cement industry, which the Foreign Office published on Thursday. Sir William states that no other branch of trade in the country has expanded so rapidly, nor has there been one in which has occurred so much over-production. The first factory was only established in 1852, and the second and third did not appear till 1854. Thereafter works sprang up rapidly, until in 1882 the number was 420, and thirteen years later 1,274. No official statistics have been issued since 1895, but there has been no falling off in the increase of factories since that time. The production of cement was about 4,200 tons in the early 'fifties, increased to 509,200 tons in 1882, to 2,070,400 tons in 1895, and is now estimated at 5,000,000 tons annually.

More than one-fourth of the exports go to the United States, but the market there is diminishing, as America is fast becoming able to supply its own needs. The next largest customer is Holland; British South Africa third and the United Kingdom fourth, the annual consignments here being about 37,000 tons.

"During the first years of the existence of the German cement industry," remarks Sir William, "the German product had considerable difficulty in competing in Germany itself with British cement, owing to the cheaper prices of the latter, which in many instances was able to be transported at lower rates of carriage from the United Kingdom to inland German markets than were charged for transporting the German cement to such markets from the locality where it was produced. It was, moreover, at first difficult for the German manufacturer to convince the public in this country that many kinds of German cement were quite equal in quality to British. Gradually, however, the disinclination of the German consumer to use the home product disappeared, whilst the German cement works managed, by improving their methods of manufacture, and by erecting works in localities more favourably situated as regards water communication, to reduce their prices, and German cement was not only more and more used in this country itself, but it gradually became also an important article of export from Germany, and entered into serious competition with British cement in most foreign countries, and to a certain extent even in the United Kingdom itself."

Up to the end of 1900 the German industry, despite the excessive production, was very profitable, and the average dividend paid in 1899 by the larger works was 17 per cent. This prosperity was principally due to the existence of the trust, which was a combination of eight syndicated groups, and was able to largely control prices. The collapse of the trust came about through the breaking away of several of the syndicates. All efforts to reconstitute the trust have hitherto failed, one of the reasons urged by some of the companies against the maintenance of a high level of prices being that the best way to bring about a healthy condition of the trade is to bankrupt the undertakings that are financially unsound, by keeping prices ruinously low. The British Consul does not think such a policy can be carried out for any length of time without disastrous consequences for all concerned, and he adds that the fierce competition of the last few years would not have been possible but for the immense stocks in hand, the result of previous over-production. Some idea of the drop in prices can be obtained from the fact that since 1899, whilst the quantity of exports has increased 28 per cent., the value has declined 33 per cent. Very small profits have been earned by manufacturers during the last few years. Yet, although home and foreign consumption is unable to absorb the large stocks still in existence, new factories continue to be built.

Builders' Notes.

The Accepted Tender for Hull's New Public Hall—construction of basement and shops of second portion—is that of Mr. G. H. Panton, his price being £15,269.

Messrs. John Pickles & Son, engineers, have moved to new works at Mytholm, Hebden Bridge, which have been constructed and equipped to meet the increasing demand for the firm's improved sawmill and woodworking machinery.

Messrs. Rottmann & Co., of 25 and 26, Garlick Hill, Queen Victoria Street, E.C., manufacturers of Japanese leather papers and English wallpapers, have just opened West-End show-rooms at 29, Mortimer Street, W. The City address, however, will continue to be the head-office and warehouse.

New York Building Trade: Declaration.—The constitution of the new Associated Building Trades of New York and vicinity declares it shall be "the special duty of this body to use the united strength of all trades represented herein to compel all non-union men to conform to and obey the laws of the trade to which they should properly belong, and if necessary all affiliated trades shall, on a two-thirds vote of the body, cease work; any trade refusing to comply shall be fined 500 dollars (£100)."

Manchester School of Technology: Award in favour of the Builders.—Sir William Emerson, the arbitrator appointed to settle differences existing between Messrs. Robert Neill & Sons, builders, of Manchester, and the Manchester Corporation, which had arisen in connection with the erection of the School of Technology, has directed that the Corporation shall pay to Messrs. Neill the sum of £19,920, which sum was to be a full satisfaction of their claims, the Corporation to pay their own costs and also the costs of Messrs. Neill, which were to be taxed. Sir William Emerson also awarded and fixed his own fees and costs, including the fees of Mr. Young, a London quantity surveyor, at the sum of £988, and directed that such sum should also be paid by the Corporation.

Obituary.

Mr J. H. Reed, joiner and contractor, of Carlisle, died on January 2nd.

Mr. Robert McCracken, a Belfast builder and contractor, fell from a scaffolding in Dublin on January 5th, and sustained fatal injuries.

Mr. Edward Tidman, hon. secretary of the Sanitary Inspectors' Association, died on January 3rd and was buried on Saturday last.

Mr. R. C. Else, who died recently at Bristol, aged 81, was an engineer, and was associated with Mr. Brunel in the construction of the Bristol and Exeter Railway and the Saltash Bridge.

QUANTITY SURVEYING IN THE TRANSVAAL.

THE following notes on modes of measurement in the Transvaal will be of terest to English quantity surveyors:—

Brickwork.

This is measured per yard super., and each ickness is kept separate. Openings are not ually deducted, but no fixed rule exists, d it is therefore best to state what is done ith regard to openings. The Public Works epartment issues quantities with brickwork yards cube measured nett, all openings ing deducted.

Floors.

In English practice, of course, floors are easured in the various items of plates, joists, oring, &c. The custom in the Transvaal is to easure wood floors in squares super., including everything, sometimes even sleeper walls. he sizes of plates, joists, spacing, &c., are ven under the one head. The Government antity surveyors measure these items in the ual London way, except that timbers are lled in lineal feet under the several sizes, d notes follow framed and unframed mbers, thus :—

(NOTE.—The above equals cubic feet.)

In taking dimensions all timbers are taken feet, anything less than 1ft. being taken 1ft. Thus, floor joists 12ft. 3ins. long ould be measured 13ft. each, and so on. his applies to all timbers.

Roofs.

Slates and steel or wood shingles are casionally used for roofs, but the usual ofing material is corrugated iron, and with is covering timbers are very much lighter an in English practice. Except for zinc ts, boarding is rarely used. Roofing papers e sometimes employed. The timbers are ther screwed, spiked or bolted, and very ttle "framing" is done in ordinary work. he local custom is to measure roofing per uare complete, including timbers, coverings, ridges, hips, &c., stating the sizes of nbers, distance apart of trusses (there are "common rafters"), description of coverg, &c. The Government quantity suryors measure the work in the London way, lling the roofing iron in squares super., easured nett. and the ridges, hips and lleys in lineal feet, also nett. Allowances e made of 6ins. to abutments for cutting d 1ft. to valleys and hips. The roofs are quently painted with oxide paint, and in easuring this paintwork one-third should added for laps (in good work), as on an erage the laps take practically one-third a sheet of iron and should be painted fore fixing. The timbers are measured as scribed under "floors." Ridge-pieces are t absolutely necessary, though they are metimes used. Hips and valleys should ve fillets (or hip or valley purlins) on ch side. Eaves-gutters, &c., are measured the ordinary way.

Joinery.

Imported joinery is very largely used, "purse-made" work being expensive. Imported irtings, cornices and architraves are largely ployed. These are measured in lineal feet, cluding mitres, &c., and all grounds (if y). There are several sizes of imported ndows and doors, including casement shes, ordinary cased-frames and sashes, ench casements, four-panel doors, glazed ors, &c.

Imported windows and glazed doors are azed before importation. In local practice ese items are all numbered, including all mes, glass, &c., and generally all sash steners, lifts, &c. It is necessary to know ich are and which are not imported signs and sizes in doors and windows, and keep "imported" separate from "purposede." The Government quantity surveyors mber all doors and windows, but do not clude door frames and glass (if "purpose-made") or ironmongery, all of which are measured as in London.

Generally.

The general idea in quantities in the Transvaal seems to be to get in a sufficiency of "inclusive" items. "No. 1 chimney breast and stack" or "No. 1 French casement 4ft. by 7ft." (including everything) are specimens of items one sometimes sees. The quantities issued by the Government are gradually training local builders to price work more in accordance with London practice, and before very long they may have a beneficial effect on the work issued by private surveyors. As elsewhere, builders are alive to their own interests, and it is scarcely to be doubted that good quantities will assist them in the Transvaal as much as they do in the "Old Country." They will soon expect private surveyors to give them the same help (by giving them good quantities) as is given them when they tender for Government work.

A. BELL-JOHN.

OUR PLATES.

THE cricket pavilion at Wellington College, erected recently from the designs of Mr. Charles J. Blomfield, F.R.I.B.A., of London, by Messrs. J. Dorey & Co., of Brentford, consists on the ground floor of a large visitors' changing room connected with lavatory, bathroom, shower baths, &c. The chief portion of the other end of the building is devoted to the professionals' use, and consists of a mess-room, lavatory and shop, the last having a hatch opening into the entrance hall. Access to the scorer's box is also obtained from the hall. Beyond the professionals' room is a large out-building for the accommodation of grass mowers, rollers and other plant. A verandah runs the entire length of the building facing the field, the level of this being the same as that of the ground floor, namely, about 18ins. above the ground level. On the first floor is a large dining room, through which access is obtained to the balcony, which extends over a portion of the verandah. There is a small second room on this floor and also a scullery. Ample space is allowed for cricket-bag stands. A heating chamber is provided in the basement, the hot water being supplied therefrom to the lavatories and to a complete system of heating by coils This has been done in order that the building may be available for use other than a cricket pavilion during the winter months. The walls have been carried up in brick, covered with rough-cast, and the roof is tiled. A small clock turret is placed in the centre bearing the college arms on the lower portion of the turret facing the field. It is proposed to panel the dining-room in oak and to record thereon the cricket elevens and football fifteens of former years.

The house at Dore is on a very steep and exposed site, from which the stone used in its erection was obtained. The windows are of wood painted white; the roof covered with stone slates. The dining-room, hall and nursery were to face the sun, and the approach to the front door was to be convenient to the road and not to disturb the garden, which is on the sun side. This has resulted in the front door being placed in the angle. Mr. Edgar Wood, of Manchester, was the architect.

The block of business premises in Tooley Street, London, S.E., was completed last year from the designs of Mr. C. Stanley Peach, F.R.I.B.A., of 28, Victoria Street, S.W.

A Tower 1,500ft. High has been designed by Professor Despradelle, instructor in architecture at the Massachusetts Institute of Technology. It is intended for New York and will contain auditoriums, entertainment halls, &c.

THE TIMBER TRADE.

The London Market in 1904.

MESSRS. CHURCHILL & SIM, the large timber brokers, report that the importation of wood into the United Kingdom during 1904, as computed by the Board of Trade, has been smaller than in its immediate predecessors, but works out to nearly the average of the six years 1898-1903. Values have fallen heavily during 1904, and the totals given on the next page are less than those of any of the five previous years. The year's trade has been differentiated from that of any of its recent forerunners by the fact that the course of prices has been dictated throughout by what buyers and importers in the consuming markets were willing to give rather than by what owners and shippers in the exporting countries were wishful to obtain; and while this has made the year one of great disappointment to all sellers, it has nevertheless not by any means resulted in an all-round profit to buyers, inasmuch as with a diminishing outlet and falling prices they have constantly been left with stock too expensive for the requirements and opportunities of their retail customers. Up to Christmas-time in 1903 shippers were making very hopeful progress with sales for forward delivery at about their own ideas of value, and, in spite of much talk of bad trade, their buyers were discriminating rather as to what specification they would speculate in than making much serious objection to the rates they were being asked to pay. Business was broken off for the holidays, and directly the attempt was made to resume it in January, 1904, it was apparent that a change had passed over the scene. The results of the year's trade in 1903 had not been satisfactory; it had not been possible to reap a fair profit on the prices paid to shippers in that year. On all hands the prospects for a worse year's consumption in 1904 were becoming more evident. "Why hurry to pay these prices again? we will wait"—this was the tone which met all the attempts of the agents to resume selling, and waiting became the order of the day accordingly. This quiescent attitude was maintained on both sides throughout January and February, but meanwhile consumption was falling off here and prices for stocks in this country were shrinking. In March the Swedish shippers made fruitless attempts to meet the situation with lower quotations, which only increased the depression, Russian shippers meanwhile continuing to hold obstinately for hopeless rates, bound together by a combination among themselves which eventually cost them dear. In April they lowered these quotations by over 20s. per standard, and the Swedes again reduced their ideas to meet the competition, but buyers still refused to operate for more than pressing requirements, and these were small. May passed away with prices constantly reducing, and business confined within the narrowest limits. In June more courage became visible and here and there larger sales were possible, when sellers would go below the cheap level to which prices had by that time fallen. A note of hope was sounded, moreover, as to the position for the second half of the year. It was still hope deferred, however, through the holiday months of July and August, very cheap selling being resorted to under pressure of financial and other necessities, and it was not until the serious resumption of business in September and October that it was realized that the necessary selling for the year was being accomplished and that prices had been driven low enough and would go no lower. With that position the year closed, the recovery in the last two months having been infinitesimal, although quite apparent, while business for 1905 has still to open, no definite progress having yet been made towards

Wood Imported into the United Kingdom in the following years:—

carrying the problems for the coming season beyond the regions of speculation.

The prospects for the wood trade in 1905 are more difficult to write of than usual at this time of year, in consequence of the unpreparedness of buyers to discuss fresh business at present, and the recognition by sellers that it is unwise to press such discussion prematurely. Data are therefore wanting on which to base any accurate forecast, and material for judgment can only be drawn by analogy from what has gone before. Taking first the probabilities of supply in 1905 from the great wood-producing countries, there seems reason to suppose that the shipments from Sweden may be roundly identical with those of 1904. More than usual has probably been held over from the past season, but there is less inducement than for a long time past in the range of prices to induce fresh production. From Russia also the shipments for 1905 may be fairly reckoned on as likely to be similar to those in 1904. Again, the stocks held over are probably large, but the uncertainties and difficulties in the way of the exporting merchants in making their arrangements for the future are great and are already operating in the direction of a probable hindrance of shipments for 1906. With this in their minds, Russian shippers are not likely to press off 1905 shipments with undue haste. From Canada the shipments in 1905 are likely enough to be restricted and intercepted by the great demands of the still growing prosperity of the American States; while from other sources supplies may be taken as normal, and therefore unimportant. Turning now to the even more vital subject of the consumption for 1905, there are some encouraging signs on the horizon. The Board of Trade returns of the general trade of this country have been unmistakably hopeful during the past autumn, and in the wood trade itself all the depression and gloom of failing trade and falling prices, with no good prospect ahead, which have been characteristic of 1904, must have told with even undue force against the consumption of that year; so that starting fresh in 1905 from the lowest point, and with Hope again at the helm, it is reasonable to expect some reaction of feeling and some expansion of trade. Almost the chief difficuly in 1904 has been to find markets for 3in. by 9in. and 3in. by 11in. deals, in the absence, on any such scale as in former years, of the demand for them from the Cape market. The Cape demand may not be good in 1905, but it seems reasonable to expect that it may be better than it has been in 1904, and, if so, this will impart a definite element of strength to markets generally. Gathering up the probabilities, they seem rather to point to the birth and growth of a general but quite moderate recovery both in trade and prices during 1905, which must be nursed and sympathized with by shippers as a plant easily crushed altogether by harsh or unwise treatment.

From the figures here given the falling off in the consumption and distribution of wood through the London area as compared with recent years is very clearly seen. The estimated consumption is the smallest since 1900. The deliveries from the docks of deals and battens are the smallest since 1896, of boards the smallest since 1900, and of timber the smallest which we have ever known; and these figures are very significant of the trend of last year's trade. The overside deliveries are also below the average of recent years, and the whole series give rise to rather far-reaching misgivings as to the extent to which the London trade can continue profitably to pass the great stream of supply through the port into an area now unduly and increasingly circumscribed in comparison with its population by competition with more lightly charged ports.

As regards Hardwoods.

Messrs. Foy, Morgan & Co. report that the mahogany market during 1904 has pursued a very steady course, and although it has had to bear its share of the general slackness of trade it has escaped the violent fluctuations to which some branches of trade have been subjected. The total quantity of mahogany of all kinds imported into London during the year has been several thousand tons more than in 1903, but the total nevertheless remains at a very moderate figure. During the first few months prices for small and medium sized logs gradually declined until they were about 20 per cent. lower than at the end of 1903. This reduction was brought about almost entirely in consequence of the excessive quantity of small and medium sized Cuba logs that was brought into the market. Prices for sound logs of good sizes have remained steady throughout the year with very little fluctuation. During the last three months the importations have been very moderate for the time of year, and prices of small and medium sized logs have risen, though up to the present they have not quite recovered all the ground lost in the early part of the year. The unexpectedly quiet time experienced in the cabinet trade has influenced prices adversely and the slackness of building operations has also had its effect. Considering the dullness of business generally, the mahogany trade has held its own very well through what has been an unusually trying season. At the present time the importations are somewhat below the average for the time of year and a little increase in demand would quickly effect a rise in values.

Cedar.—At the commencement of the yea prices were at a fair level and stocks moderate but the box-making trade throughout Europ generally was not very brisk. Consumer had anticipated their requirements for th first six months of the year by purchasin cargoes afloat and for shipment; but, unfortunately, shippers were not content wit the quantities thus sold, and they sent furthe consignments upon the market, with th result that prices gradually declined unt they were about 12 per cent. below the figure at the end of 1903. Shipments were curtailed during the summer in consequenc of values having reached an unremunerativ level, with the result that during the autum the market began to assume a more health tone. The rate of consumption did n materially increase, but in the face of ver light importations stocks were reduced to more moderate level.

The importations of mahogany and ceda into London during 1903 and 1904 hav been as shown by the table at the bottom this page.

American Hardwoods.

Whitewood.—Some accumulation of supplies, combined with the general dulness trade, caused a considerable fall from th high prices which had been current in 190 Latterly, however, a more regular busine has been done at fair prices.

Oak.—Quartered oak has been in le demand, and although the supply has bee by no means excessive there has been decline from the high prices which we current a year ago. Plain sawn oak plan were too heavily shipped and could only sold at reduced prices. Boards were not much affected, and stocks having now bee reduced, prices are well maintained.

Maple Flooring.—There is little change report concerning the trade in this artic during 1904. The amount of business do has not differed materially from that of t previous year. Prices for the first-class pr ductions have remained stationary, but so inferior qualities have been placed upon t market at reduced figures, and have secur a share of the trade where high grade materi is not absolutely demanded.

East India Teak.

Logs.—Supplies throughout the year ha been scarce, the landings in London bei the smallest for many years. In spite of t fact, prices were slightly easier during t first few months on account of the absence demand. The total amount of trade exhib a considerable shrinkage in quantity co pared with previous years.

Planks.—The market continued steady the spring, chiefly because supplies ca forward so sparingly, but the demand w very weak in the summer and prices droop Towards the end of the year there was m life in the demand, coupled with an alm complete cessation of supplies, causing pri to recover and finally to advance to highest point obtained during the year.

The following figures show the quantit of teak landed and delivered at the Lond docks during the years 1903 and 1904:—

	1904.	1903.
Landed - - - -	7,460	13,859 loads.
Delivered - - - -	9,701	11,121 ,,
Stock on 31st December -	8,559	10,870 ,,

(Overside deliveries for coast ports and the Continent are not included).

Australian Hardwoods.

Jarrah.—The stock of paving sizes on spot was excessive at the beginning of

ar, and prices gradually declined. Fresh rivals were more than sufficient for the rrent demand during the first half of the ar and finally led to some sales at very low ices. The market has remained weak in ew of the abundant supplies avilable, and likely to continue in the same unsatis- ctory condition until shipments are better gulated to the requirements of consumers.

Karri.—The market has been depressed and prices have ruled low.

Kauri Pine.

There has been a steady demand, although some difficulty has been experienced in obtaining the higher prices necessitated by the increased cost of shipments. Supplies have been sufficient but not excessive.

The abstract of stock, consumption, &c., for the month of December, published by Messrs. oy, Morgan & Co., is as follows : —

Keystones.

The Rawson Square Market Extension in radford is now approaching completion.

Bradmore House, Hammersmith, built out 1700 and reputed to be the oldest use in the district, has been sold on a ilding lease and is to be pulled down to ake way for new property.

"Public Works," founded in July, 1903, as monthly magazine, is now published arterly. The issue for January contains number of interesting articles, including e by Mr. Killingworth Hedges on lightning otection.

A Grinling Gibbons Fireplace.—Owing to e alterations following on the recent sale Wootton Wawen Hall, near Stratford-on- von, the carving in sycamore wood of game, uit, &c., by Grinling Gibbons, which lorned the old drawing-room fireplace was ld for 175 guineas last week at Messrs. night, Frank & Rutley's galleries.

Ancient Wall-Paintings have been dis- vered in Trotton Church, Sussex. The est wall is covered with paintings which ere obliterated with lime by an icono- astic incumbent about 1850. The subjects picted are the seven deadly sins. On the rth wall the legend of St. Hubert is repre- nted, and on the south wall a figure of St. eorge, the patron saint.

"Building and Architectural Events of 04."—The illustrations of "main entrance" d "recreation and dining rooms" given p. 1 of our issue for December 28th as be- nging to the new hospital at Seacroft, eds, are really part of the Frimley Sana- rium, illustrated on p. 3 of the supplement. e architect of both institutions is Mr. lwin T. Hall, F.R.I.B.A., but Messrs. Young Hall are the architects of the Crewkerne spital.

The Usher Hall, Edinburgh, came up for scussion again at last week's meeting of e Edinburgh Town Council, but the matter as further adjourned, the committee being structed to make another attempt at uning the cost. The sum of £100,000 was t by the late Mr. Usher eight years ago, and now said to have increased to £120,000. The uncil have agreed to make a contribution at will bring up the total to £145 ; but ll are not settled as to what shall be done.

"London Old and New" is the title of an article by Mr. John Burns in the "Pall Mall Magazine" for January. It is illustrated by some fine drawings by Mr. Hedley Fitton.

The Manchester Hippodrome has been erected in Oxford Street from designs by Messrs. Frank Matcham & Co., of London, architects of the London Hippodrome and the Coliseum. In addition to the Hippodrome the block includes a restaurant and a large shop with offices over. The arena is 42ft. in diameter and contains 70,000 gallons of water below the floor, which is lowered and raised by a hydraulic ram; depths of water varying from 1ft. to 6ft. 6ins. being obtainable.

National Memorial to Queen Victoria.—The processional road along the Mall having been completed, the extension of the Mall eastwards is now to be proceeded with. Already the old Admiralty Offices in Spring Gardens and some business premises fronting Trafalgar Square have been demolished, and when possession can be obtained others will also be pulled down. A model of the memorial 8ft. high is exhibited at the Royal Academy Winter Exhibition, now open at Burlington House.

Royal Academy Lectures. Mr. Alfred Gilbert, R.A., will visit London shortly for the purpose of delivering six addresses at the Royal Academy in his capacity of Professor of Sculpture. The dates of the lectures are January 30th and February 2nd, 6th, 9th, 13th and 16th. On February 20th, 23rd and 27th and March 2nd, the Professor of Architecture, Mr. George Aitchison, R.A., will deliver four lectures on Vitruvius; and on March 3rd and 6th Professor Waldstein two on "Greek Sculpture."

Action against an Architect for Alleged Negligence.—In giving judgment in the action recently brought by Mr. Hodgson against Mr. Waugh, architect and civil engineer, of Bradford, claiming damages for illegal negligence and breach of duty (see p. 306 of our issue for December 7th) the Lord Chief Justice said that the plaintiff had in no case made out his claim to damages. He dismissed the action, and on the counterclaim entered judgment for the defendant for £1,018. A stay of execution was entered on terms with a view to an appeal.

R.I.B.A.

Discussion on Rural By-Laws and on the London Building Act.

A MEETING of the Royal Institute of British Architects was held on Monday evening at 9, Conduit Street, W., the chair being occupied by Mr. John Belcher, A.R.A., president.

The following were elected Fellows of the Institute :—Messrs. C. H. Brodie (London), G. A. Humphreys (Llandudno), W. T. Lockwood (Chester), A. E. Powles (Northwich) and E. R. E. Sutton (Nottingham).

The decease was announced of Mr. A. E. Perkins, F.R.I.B A., Mr. J. T. Wimperis, F.R.I.B.A., and Mr. A. C. Wissenden, A.R.I.B.A.

A discussion took place, first, on the paper by Mr. Lacy W. Ridge on "Building By-laws, specially in Rural Districts" and, then, on the paper by Mr. James S. Gibson on "Architectural Design and the London Building Act," which papers were reported in our issue for December 21st last.

Mr. Ridge moved that in the opinion of the meeting it was desirable that the Local Government Board should obtain Parliamentary powers to enable it to reform the by-laws now in force in rural districts and small towns, and to enable it to enact such by-laws as were necessary in rural districts.

Mr. Edwin T. Hall, in seconding the motion, emphasized the necessity of reforming rural by-laws in order to enable houses to be built cheaply so as to keep the agricultural labourer on the land. He thought it would be right for local authorities to be supplied with a block plan showing the position of a proposed building on the site.

Mr. G. Bertram Bulmer next spoke. Mr. S. W. Cranfield suggested that one code of by-laws for rural and urban districts would be sufficient if various kinds of buildings were differentiated between.

Mr. J. Douglass Mathews thought the provision exempting from the operation of the London Building Act a building a certain distance from other buildings should be extended to the local by-laws.

Mr. G. A. T. Middleton thought a single code for all districts was advisable, because relaxed by-laws in rural districts might lead people away from an urban area until the conditions were reversed.

Mr. C. H. Brodie and Mr. George Hubbard next spoke, and the motion was carried unanimously.

Mr. William Woodward opened the discussion on Mr. Gibson's paper. He first reminded the meeting that Portland Place was 120ft. wide. He advocated some such provision as in the New York by-laws which enacted that a certain percentage of site area should be left open, without regulation of position, should be substituted for the present provision in the London Building Act. He thought no body should be exempt from the operation of the Act—neither railway company, H.M. Office of Works, nor even the London County Council itself. He advocated district surveyors being practising architects, because they sympathized with their aims and helped them out of their difficulties without any detriment to the public interest.

Mr. Bernard Dicksee, district surveyor, thought the Act of 1894 was totally inadequate as regards open spaces. He strongly endorsed the view that district surveyors should be practising architects. Mr. Edwin T. Hall, Mr. E. W. Hudson and Mr. H. H. Langston also spoke. Mr. Gibson, in reply, said his object in the paper had been to point out all those details which were conducive to the artistic development of architecture. The width of streets was relative to the height of buildings. A few words from Mr. Belcher concluded the meeting.

Complete List of Contracts Open.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDERS MAY BE OBTAINED.
	BUILDING:		
Jan. 12	Cork—Forty-six Houses	Town Council	City Engineer's Office, Municipal Buildings, Cork.
,, 12	Kilkenny—Thirty-three Cottages	Rural District Council	Clerk to Council, Kilkenny.
,, 12	Dorchester—Post-office	Commissioners	Post-office, Dorchester.

,, 28	Sowerby Bridge, Yorks—Sewage-disposal Works	Urban District Council	C. L. Whitehead, Holling's Mill Lane, Sowerby Bridge.
,, 30	Windsor—Sewer	Streets Committee	Borough Surveyor's Office, Windsor.

Electrical Notes.

The Electrical Contractors again.

As we foretold some time ago, the notice
hich the Electrical Manufacturers' Associa-
on gave the Electrical Contractors' Associa-
on has been determined, as the latter body
said to have wished to renew under terms
hich the former could not consider. Both
des allege grievances against the other—the
ontractors that the manufacturers have been
reaking the terms of the agreement by
iving preferential discounts (not to say
rdinary trade discounts) to persons outside
ie legitimate trade; whilst the manufac-
urers allege that the contractors have been
uying from other houses. It is understood
iat negotiations will be opened with a view
a fresh agreement, although we think that
the interests of the community generally
ich trusts are not to be encouraged. It
ractically means that the contractor one
mploys to wire a house is debarred from
uying in the cheapest market, and for that
isadvantage he has been getting a preferen-
ial discount of 2½ per cent. As the customer
oes not benefit by this discount, but has to
ay higher for all his fittings, &c., in order
hat he and his class shall be prevented from
btaining any discounts, we fail entirely to
ee who benefits in the long run, as the con-
ractors' turnover would, owing to this cause,
not be inclined to increase.

An Interesting Private Plant.

Messrs. Drake & Gorham, Ltd., are putting
lown an installation at the famous resi-
lence of Lord St. Levan, namely, St.
Michael's Mount, about which there are one
or two novel features. Owing to the fact
that the walls of the castle are often soaked
by sea spray, it has been deemed best to put
n a system of watertight concentric conductors in order that the risk from fire shall be reduced to practically nil. The generating plant will consist of two dynamos driven by internal combustion engines, and also of a large battery of accumulators. In addition to electric lighting, the plant will provide power to a small cable tramway which is used for bringing up goods from the sea-level through a tunnel into the mount.

The new Lyceum.

The electric-light installation at the above new music-hall has been carried out by the National Electric Construction Co. under the superintendence of Mr. Thomas J. Digby, consulting engineer. The supply is taken from the Metropolitan and the Charing Cross and Strand companies. The latter on the 3-wire system, but 200 volts pressure is used on both services, which are divided up amongst the various circuits. Change-over switches can throw the supply of either company on to the whole or part of the circuits. Except in the dressing-rooms, where casing is used, the whole of the installation is wired in solid-drawn screwed barrel, into which Henley cables of 2,500 megohm grade are drawn. The fittings were supplied by the General Electric Co. to the approval of the architect, Mr. Bertie Crewe. Altogether there are about 2,000 lights, of which the dome of the auditorium has 180 split up amongst 20 nine-light electroliers. In addition to these are many clusters, brackets, candelabras and standards, the prevailing design being Louis XV. Current is also supplied for "Excello" flame arc lamps at the exits, and for ventilating motors, whilst 100 ampères are required for the cinematograph lantern. The latter is in a room of special fireproof construction. The whole of the wiring was completed in the record time of two months.

B.O.T. Three-phase Regulations.

The Board of Trade has just issued regulations dealing with extra high-pressure for three-phase current supply systems. Some of the important points are as follows:—The low-pressure supply will be given from sub-stations by continuous or alternating current on a three-wire system; all alternating current to be at a frequency not differing from 25or 50 cycles per second by more than 2½ per cent. The power supplied to any sub-station below ground must not exceed 75 kilowatts, except by consent of the Board. The power supplied to a transformer placed singly in a street box must not exceed 30 kilowatts without consent of the Board. The extra high-pressure shall not exceed the specified volts by more than 10 per cent., whilst not more than 1,000 kilowatts shall at any time be transmitted by any extra high-pressure trunk main. The neutral point of the star windings of each three-phase circuit may be connected with earth, or insulated. If the latter, an electrostatic galvanometer must be connected between it and earth.

A.M.I.E.E.

A new Lectureship in the History of Art has been instituted at University College, London, the lecturer being Mr. D. S. MacColl, M.A. (London), B.A. (Oxon.). During the past term Mr. MacColl delivered lectures on "The History of Art from Hogarth to Constable." He will continue his course in the coming term on alternate Fridays at 4.30 p.m., beginning on January 13th, the subject of this course being "English Art from Constable to the Present Time." The lectures are open to the public as well as to students on payment of the fee of one guinea. Applications for tickets should be addressed to the secretary of University College.

Winduss,* 307, Hessle Road	93	0	0

* Accepted. [All of Hull.]

Purley.—For the erection of a stable in Brighton Road. Mr. Frank Windsor, architect, 1, High Street, Croydon:—

W. Walker, Purley	£490
W. Pearson & Co., Croydon	420

Purley.—For the erection of a billiard-room in Brighton Road. Mr. Frank Windsor, architect, 1, High Street, Croydon:—

W. Walker, Purley	£580
W. Pearson, Croydon	435

A new Baptist Church and School at Newcastle-under-Lyme is to be erected from designs by Mr. E. Stanley Mitton, of Birmingham. The church will be raised 5ft. above ground level, the school being placed under, with accommodation for 300, large classroom and vestries being provided, with exits at each end. The outside will be faced with red terra-cotta. Heating will be by low-pressure hot water.

Bankruptcies.

[Abbreviations: R.O.—receiving order; P.E.—public examination; C.C.—county court; O.R.—official receiver; Adj.—Adjudication.]

During the week ending January 6th twenty-two failures in the building and timber trades in England and Wales were gazetted.

H. Parsons, builder, Ickleton. Adj. Dec. 23rd.

T. Moon, slater and tiler, Clay Cross. R.O. Dec. 30th.

G. Baker & Son, builders, Wimborne. Adj. Dec. 23rd.

D. Roberts, builder, Manchester. R.O. Dec. 22nd.

J. Berry, builder, Lewes. R.O. Dec. 23rd.

J. E. Bowen, builder, Garnant. R.O. Dec. 31st.

Lewis & Son, builders and contractors, Maesteg R.O. Dec. 29th.

J. H. Booth, painter and decorator, Ilkeston. P.E., Derby C.C., Jan. 17th, at 11.

Parker & Co., builders, decorators, &c., Manor Park R.O. Dec. 31st.

O. Capell, builder and contractor, Dover. R.O Dec. 31st.

W. Good, builder, Cleethorpes. P.E., Grimsby Town Hall, Feb. 2nd, at 11.

NOTICE TO OUR SUBSCRIBERS.

THE INDEX OF "THE BUILDERS' JOURNAL."

The Title Pages and Index to any volume of "THE BUILDERS' JOURNAL" may be had free, upon application being made to the Office, Great New Street, enclosing 1d. stamp to cover postage of same.

VOLUMES I. to XIX. of
THE BUILDERS' JOURNAL.
Handsomely bound in cloth gilt, 7/- each.
Binding Cases for any of the above Volumes can now be obtained, price **1/9** each.

Privileges open to all Regular Readers of the "Builders' Journal."

I.—Free Monthly Advertisements.

1. A Free Advertisement of 12 words in the Wanted or Miscellaneous Advertisement Columns, in one issue of the BUILDERS' JOURNAL during each calendar month will be given to any regular reader.
2. The charge of one penny will be made for each additional word.
3. Advertiser's Name and Address or Box Number must be counted, but will in no case be reckoned as more than five words.
4. All advertisements must be accompanied by the correct remittance, and should a receipt be required a stamped addressed envelope must be enclosed.
5. The Proprietors reserve to themselves the right of refusing any advertisement.

II.—Free Answers to Enquiries.

1. The services of a large staff of experts are at the disposal of all regular readers who require information on architectural, constructional or legal matters.
2. Questions should in all cases be addressed to the Editor, and be written on one side of the paper only.
3. Correspondents are particularly requested to be as brief as possible.
4. The querist's name and address must always be given, not necessarily for publication.

Note.—Owing to the large number of enquiries we receive weekly, we are compelled to restrict the advantages of this department to Regular Readers.

III.—Free Accident Insurance of £500.

1. Every regular reader of the BUILDERS' JOURNAL is entitled to the benefit of this Insurance.
2. A Pamphlet giving full details of this and other Insurance schemes inaugurated by the BUILDERS' JOURNAL for the benefit of its readers, and guaranteed by "The Ocean Accident Corporation, Limited," will be sent on application.

What is a Regular Reader?

We have employed the term "Regular Reader" throughout these announcements as the description "subscriber" is often understood to mean one who subscribes direct to the publishing office.

We mean by a Regular Reader anyone who has placed an order with us or any newsagent or bookstall for the BUILDERS' JOURNAL for one year.

Those readers who order the BUILDERS' JOURNAL through their local newsagent or bookstall should send us the newsagent's receipt. Their names will then be placed on our subscribers' list, and they will be entitled to all the advantages set out above.

5 O'CLOCK P.M. MONDAY IS THE LATEST TIME FOR RECEIVING "WANT" ADVERTISEMENTS.
OFFICE: 6, GREAT NEW STREET, FETTER LANE, E.C.

THE BUILDERS' JOURNAL SUPPLY DEPARTMENT.

Following our settled policy of helping our subscribers in every way possible, we have decided to inaugurate a department for the supply of drawing office requisites of a reliable nature, and at low prices.

We have been able to make satisfactory arrangements with the best manufacturers, and we propose to publish from time to time illustrated lists of the articles supplied with prices, &c., as follows:—

No. 1 List. Sets of Mathematical Instruments.
No. 2 List. Various Scales and Philotechnic Set.
No. 3 List. Drawing Boards, T Squares and Set Squares.
No. 4 List. Drawing and Tracing Paper, Tracing Cloth, &c.
No. 5 List. Inks, Water Colours, Paints, Brushes, &c.

LIST No. 5.

THE "PICTOR" DRAWING INKS.

1-oz. Bottles, full size, with Filler.

WATERPROOF INDIA INK.

The **Black** "Pictor" Ink is warranted pure Carbon Ink, suitable for all drawings. Its depth of colour is unrivalled; it flows freely, and dries quickly.

The **Coloured** "Pictor" Inks are all strong and brilliant, of pure hues, free flowing, and are absolutely waterproof.

The "Pictor" Inks are supplied in 12 colours (all in 1-oz. bottles), viz.:—

No. 215.

1. Black.
2. Blue.
3. Vermilion.
4. Brick Red.
5. Green.
6. Violet.
7. Orange.
8. Scarlet.
9. Brown.
10. Carmine.
11. Yellow.
12. Indigo.

10d. per bottle.

N.B.—When diluting the "Pictor" Inks, *only use distilled water.*

No. 460.

Hexagonal Sticks of Water Colours.

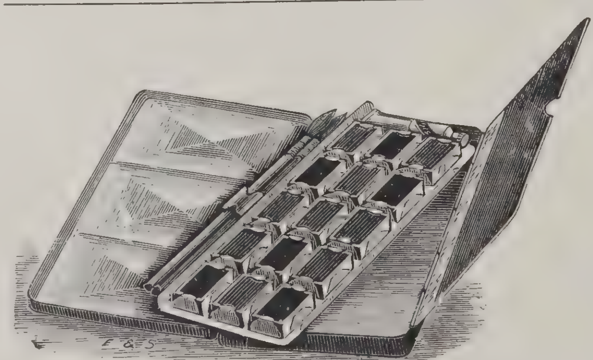
From 8d. per Stick to 2/6.

Whole Pan.

FINE MOIST WATER COLOURS.

Half-Pan.

From 8d. per whole pan to 5/-
From 4d. per half pan to 2/6.



COLOUR BOXES

This Box has also a Divided Lid and Flap be used as Palettes.

Price 3s.

With PERFORATED MOVABLE PLA or TRAY, by means of which t Pans can be removed and replac at will.

The above Prices include Postage within the United Kingdom.

All correspondence and orders should be addressed to

THE BUILDERS' JOURNAL SUPPLY DEPARTMENT
Builders' Journal Office, Great New Street, Fetter Lane, E.C.

THE
BUILDERS' JOURNAL
AND ARCHITECTURAL RECORD.

January 18, 1905 Vol. 21, No. 519. 6, Great New Street, Fetter Lane, E.C.

Summary.

A standard specification for Portland cement has just been issued by the Engineerng Standards Committee. It will be a great convenience to consumers and manufacturers. This page.)

The date of the opening of the Building Trades' Exhibition has been altered from the 29th to the 27th of April. Lord Windsor will open the exhibition. (Page 34.)

The Architectural Vigilance Society protests against the proposed new front to Victoria Station as being a huge mass of architectural commonplace unworthy of its important position. (Page 34.)

The David Lewis workmen's hostel and club, which has been erected in Liverpool at a cost of £100,000, is very much on the lines of the Rowton houses. There are 400 cubicles. The charge for each is 6d. per night, including the use of the club-rooms. (Page 30.)

Architects' registration was the main topic at the annual dinner of the Leeds and Yorkshire Architectural Society. Mr. Alfred Darbyshire said the question was the most vital one that had arisen in the profession in his lifetime. One of the wisest things the Institute had ever done was to open its arms to the brethren in the provinces. (Page 35.)

In a paper which he read last week before the Sheffield Society of Architects and Surveyors, Mr. Horace Wilson said that an easement imposed on the owner of the land subject to it only a duty to suffer something or refrain from doing something for the benefit of his neighbour; for example, the grantor of a right of way was only bound to allow the use of the way, not to keep it in repair; and similarly in the case of ancient lights he was only obliged to refrain from obstructing the light. The "45 degrees rule" had fallen upon evil times, having been declared in the Court of Appeal and the House of Lords to be worth very little as a guiding principle. (Page 33.)

The City Corporation has decided to oppose the London Building Acts Amendment Bill. (Page 34.)

The Alexander Thomson travelling studentship is to be again competed for this year, drawings having to be submitted by December 28th. (Page 34.)

The first Henry Saxon Snell prize (value £50 and a medal) is offered for an essay on the improvement of domestic sanitary appliances. (Page 34.)

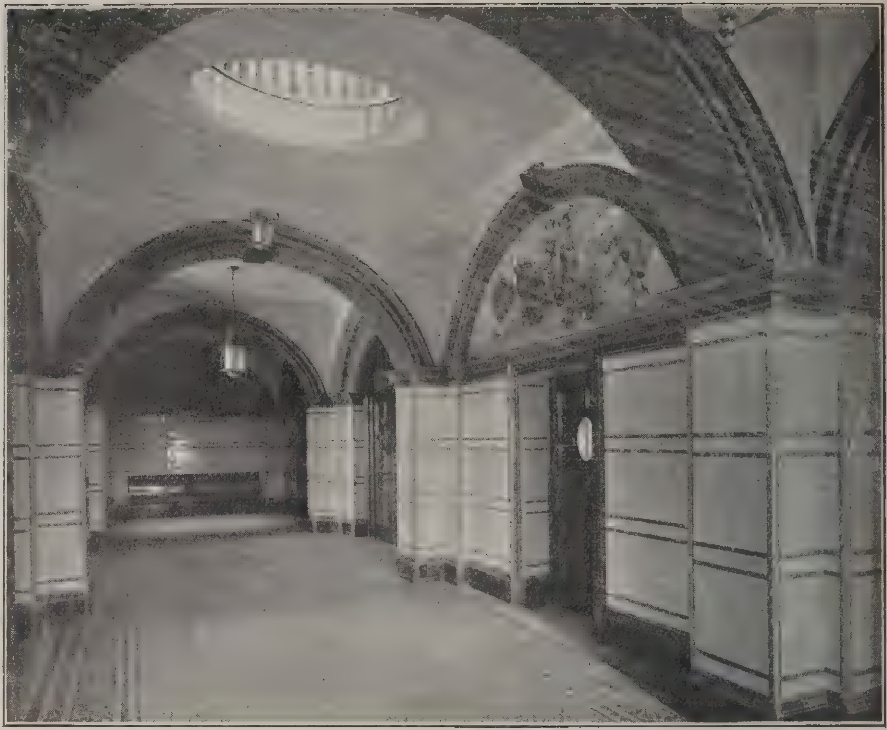
In a paper on sanitary and electrical requirements in hospitals, Mr. Charles T. Walrond, A.M.I.C.E., A.M.I.E.E., states that the drains should be small; branch drains short; trapped openings few; no trapped gulley in direct communication with the drain to receive rainwater or surface water; and iron drains provided with iron inspection chambers having airtight covers. Sinks and lavatory basins should be built into the wall, overflows dispensed with wherever possible, and floor channels adopted. (Page 37.)

The index to Vol. XX. is now ready and can be obtained from the Publisher post free for 1d.

A Standard Specification for Cement. THE Engineering Standards Committee continues its excellent work. The latest product of its labours is a standard specification for Portland cement, which has been needed for a long time by cement users and manufacturers. The Committee which drew up this specification consisted of a number of representative men. Mr. Lewis Solomon represented the Royal Institute of British Architects, and among other names we notice that of Sir John Mowlem Burt, of Messrs. John Mowlem & Co., the well-known firm of contractors, while the Associated Portland Cement Manufacturers, Ltd., were well represented. The specification stipulates for two tests—tensile strength and expansion. After cement has been bulked, samples are to be taken for testing from each parcel, either at the works or at the job. Before gauging for tests, the sample is to be spread out for a depth of 3ins. for twenty-four hours in a temperature of 58 to 64 degs. Fahr. Cement is not to be accepted for use unless previously certified in writing by the consumer to be of satisfactory quality after being tested and analysed, the cost being borne by the consumer. The cement is specified to be ground to the following degrees of fineness: (1) the residue on a sieve 76 × 76 (5,776 meshes per square inch) shall not exceed 3 per cent.; (2) the residue on a sieve 180 × 180 (32,400 meshes per square inch) shall not exceed $22\frac{1}{2}$ per cent. The specific gravity of the cement is not to be less than 3·15 when sampled at the works, nor less than 3·10 if sampled after delivery. Regarding the chemical composition, there is to be no excess of lime, *i.e.*, the proportion of lime shall not be greater than is necessary to saturate the silicia and alumina present, that is to say, the proportion of lime to silicia and alumina shall not be greater than the ratio 2·75. The percentage of insoluble residue is not to exceed 1·5, while magnesia is not to exceed 3 per cent. and sulphuric anhydride 2·5 per cent. This clause is somewhat doubtful in view of the present state of chemical knowledge, as it would appear from experiments made by Mr. Richardson in America (reported in our issues for September 14th and 21st) that not only does the ratio for Portland cement extend through very wide limits, greater than that here specified, but that the proportion of lime may be within the correct limits but not in proper chemical combination with the other elements, *i.e.*, there can be free lime present. Of course, the tests specified will guard against the free lime, but this clause seems rather superfluous in view of them. The quantity of water used in gauging is specified to be appropriate to the quality of the cement, and so proportioned that when the cement is gauged it shall form a smooth easily-worked paste that will leave the trowel cleanly in a compact mass. Fresh water is to be used, and the temperature in the room is to be from 58 to 64 degs. Fahr. The moulds are to be filled without mechanical ramming, the form of the mould being illustrated exactly. The briquettes are to be removed from the mould after setting and kept in a damp atmosphere for 24 hours, when they are to be placed in fresh water and allowed to remain until required for testing, the water being renewed every 7 days and the temperature thereof maintained between 58 and 64 degs. Fahr. Briquettes of neat cement are to be gauged for breaking at 7 and 28 days respectively, six for each period. The briquettes must bear at least 400 lbs. per square inch of section after 7 days and 500 lbs. after 28 days. The increase from 7 to 28 days is to be at least 25 per cent. when the 7-day test falls between 400 lbs. and 450 lbs.; 20 per cent. when between 450 lbs. and 500 lbs.; 15 per cent. between 500 lbs. and 550 lbs.; and 10 per cent. when the 7-day test is 550 lbs. or upwards per square inch. Tests are also to be made on briquettes prepared from 1 part cement to 3 parts by weight of dry standard sand (this sand to be obtained from Leighton Buzzard, to be thoroughly washed, dried, and passed through a sieve of 20 × 20 meshes and retained on a sieve of 30 × 30 meshes per square inch). Cement and sand briquettes are required to bear 120 lbs. per square inch after 7 days and 225 lbs. after 28 days, the increase from 7 to 28 days being not less than 20 per cent. Three distinct gradations of setting time are referred to—the setting time for "quick" cement is to be not less than 10 nor more than 30 minutes, for "medium" not less than 30 minutes nor more than 2 hours, and for "slow" not less than 2 hours nor more than 5 hours. The cement is considered as set when a needle having a flat end $\frac{1}{16}$in. square, and weighing $2\frac{1}{2}$ lbs., fails to make an impression when applied gently to the surface. The second test, referred to as the Le Chatelier method, is conducted firstly by filling a small split metal cylinder 30 millimetres diameter and 30 millimeters high, placing it in water at a temperature of 58 to 64 degs. Fahr., leaving it there for 24 hours, and measuring the distance apart of the two indicator points attached on either side of the split; and, secondly, placing the mould in cold water, bringing it to boiling point in 15 to 30 minutes, keeping boiling for six hours, and finally, after cooling, again measuring the distance between the indicator points. The difference between the two measurements represents the expansion of the cement, which must not exceed 12 millimetres after 24 hours aëration and 6 millimetres after 7 days aëration. The price of the report is 2s. 6d. nett.

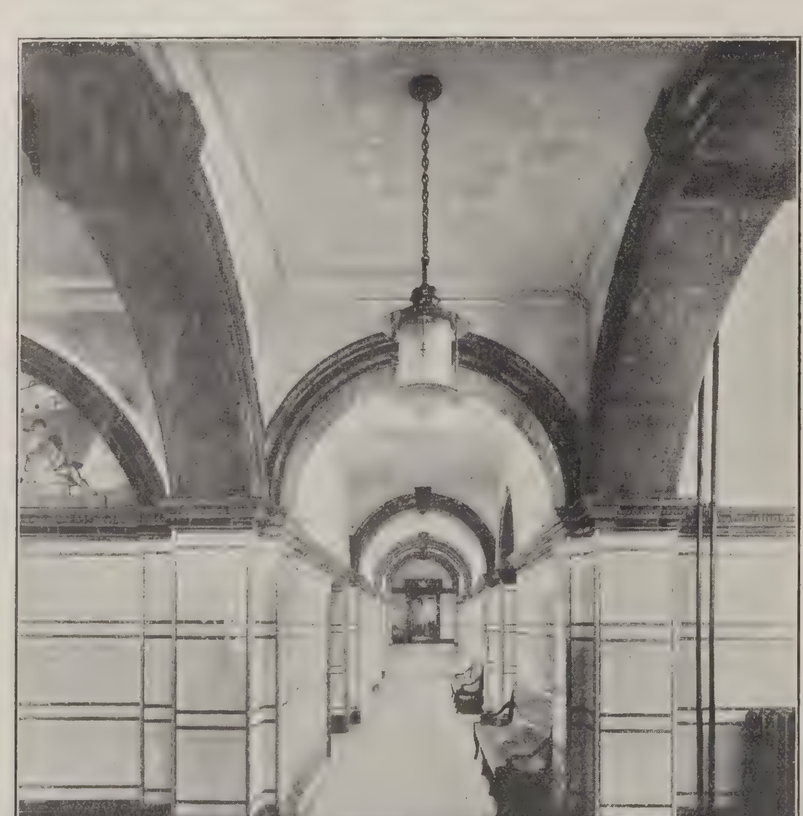
DAVID LEWIS WORKMEN'S HOSTEL AND CLUB, LIVERPOOL.

THIS building has been completed recently from designs by Mr. J. Francis Doyle, the well-known Liverpool architect, out of moneys bequeathed to Mr. B. W. Levy (of London) and Mr. G. J. Cohen (of Sydney, Australia) by the late Mr. David Lewis, of Liverpool: the object being the provision of a workmen's home and club and public hall, very much on the lines of the Rowton houses in London, though in these houses there is no such large hall as that provided in the building here described and illustrated, nor of course are there so many clubrooms. Its advantages are manifold, comprising clean and wholesome boarding-house accommodation at a low rate, a social club, reading- and billiard-rooms, facilities for educational improvement, physical development and so forth.



MAIN ENTRANCE HALL.

The building has a main frontage of 174ft. to Great George Place, a side frontage of 146ft. to Nile Street, and a back frontage to Rathbone Street. The main outer walls are of brick and terra-cotta and the roof is covered with green slates. The main entrance from Great George Place is 12ft. wide and leads to a spacious entrance hall, 50ft. by 20ft. (see plans in centre plate), arched and finished with tiles and faïence, from which access is given to the public hall. This latter is 90ft by 42ft. and 35ft. high, and supplies a real want in the south of Liverpool. It accommodates about 800 persons and is complete with stage, green-rooms, boxes and gallery. Ample exits are provided (there being no fewer than eleven) and a foyer extends over the main entrance hall. Enclosing the public hall, on one side, are the several rooms for the social club, comprising, on the ground floor, a billiard-room 67ft. by 30ft., a club-room 50ft. by 26ft., a committee-room and a toilet-room, with other club- and committee-rooms on the first floor, and still another large club-room in the basement. On this side of the site, space has been left for the erection of a gymnasium 132ft. by 54ft.



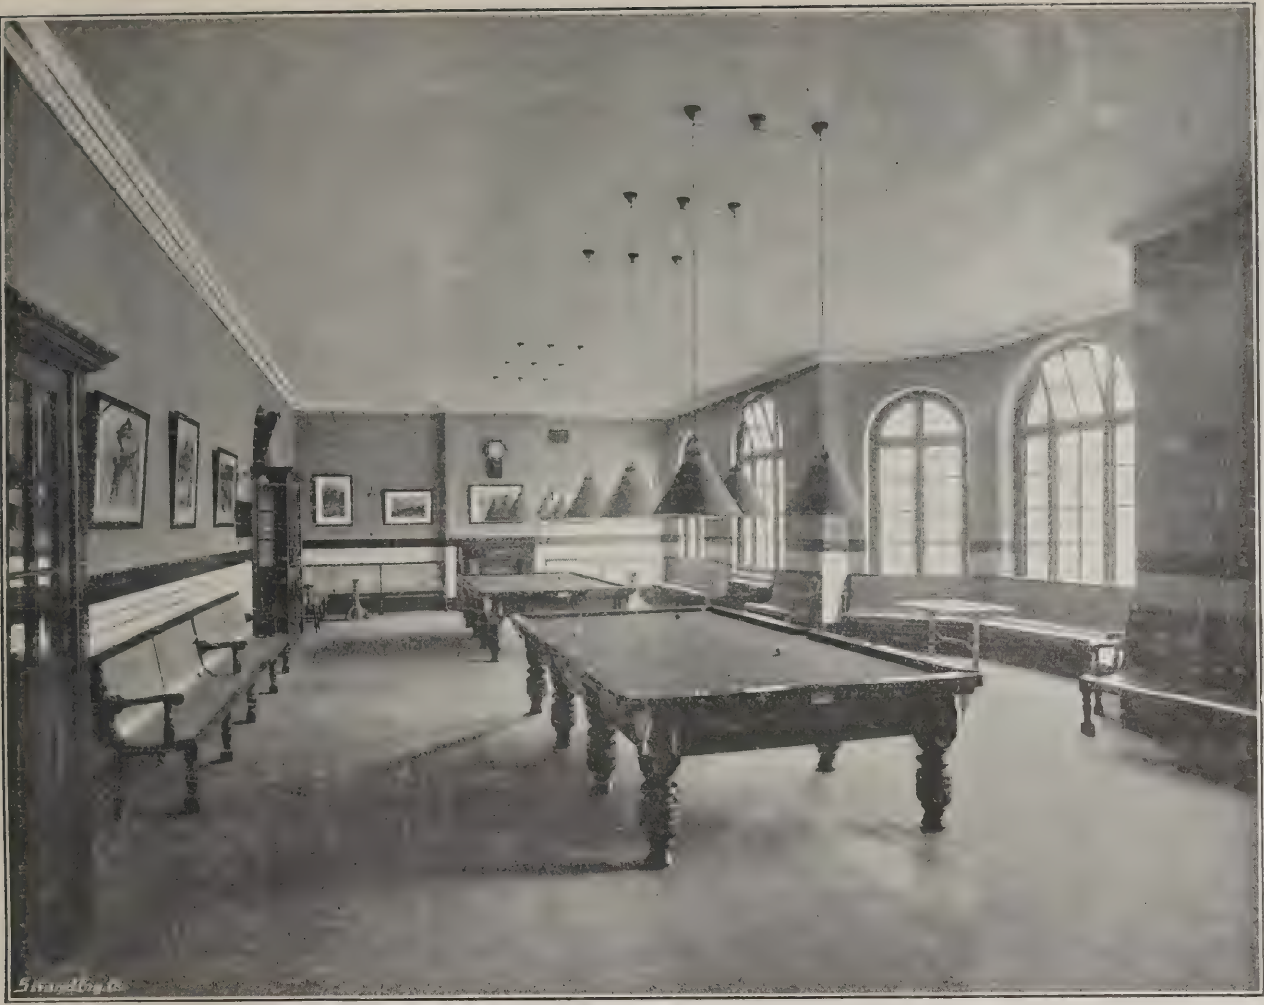
BILLIARD-ROOM CORRIDOR, GROUND FLOOR.

The workmen's hostel, or home, is entered from Nile Street through turnstiles, as at the Rowton houses in London and elsewhere. At the side of the entrance is an office, with the superintendent's house adjacent. There are wide halls and corridors, and the main staircase, of fire-resisting construction, is 21ft. square, with a hall 21ft. by 20ft. Leading off this is a reading-room 50ft. by 20ft., and between it and the dining-room is a provision shop 20ft. by 15ft. connected by lifts with the kitchen, sculleries, pantries and stores in the basement. The dining-room measures 80ft. by 41ft. and has a brick dado: two ordinary fireplaces are provided, as well as a special cooking fire and a lodgers' scullery, and every appliance conducive to comfort and cleanliness.

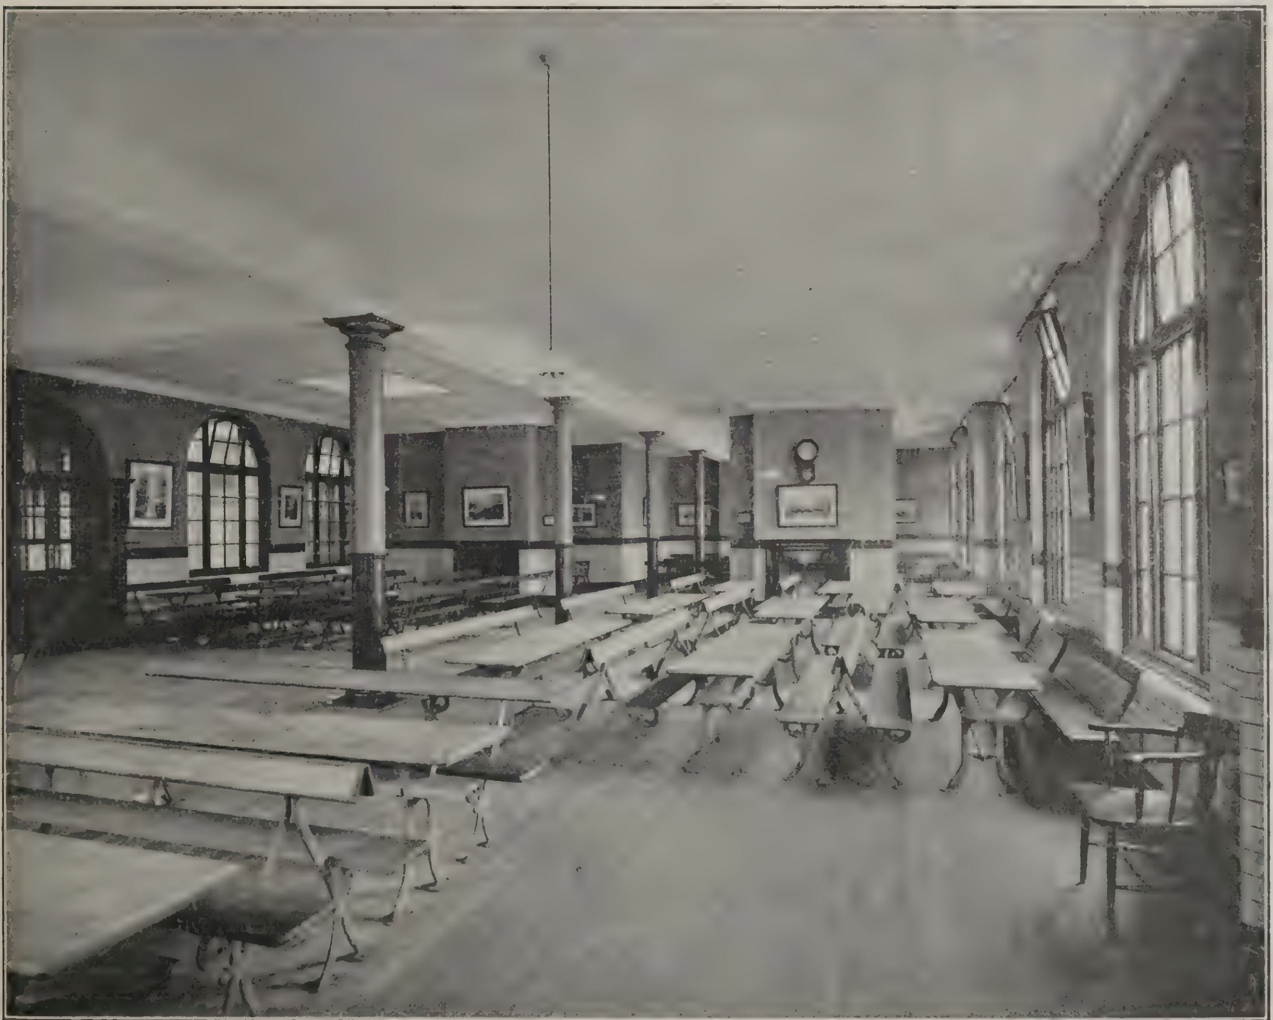
On the upper floors of the building, and approached from the large main staircase by three independent gangways, are the sleeping cubicles; two other stone staircases for emergency are also provided. In all there are 400 cubicles, arranged in groups for easy working and control. Numerous appliances for extinguishing fire are fixed throughout the building.

Over the billiard-room is a large flat, used by men who sleep in the home, and who are thus afforded the opportunity of getting fresh air under agreeable conditions. The club is not only used by lodgers, but also, under certain regulations, by the inhabitants of the locality. According to present intentions a charge of 6d. each per night is made to the occupants of the cubicles, who are also afforded the accommodation of the club, provided they behave themselves. Large lavatories are placed in the basement. The heating, ventilating and electric-lighting arrangements are thoroughly up-to-date. Mr. Isaac Dilworth was the builder, Mr. J. W. Gilling being the clerk of works, and, on his death, Mr. A. C. Leat.

The total cost of the building, including site and furnishing, has been £100,000. It will be seen to be most conveniently planned, while the embellishment of the interior with tiles and faïence, as the accompanying photographs show, is admirable.



Billiard-room.



Dining-room.

Views and Reviews.

Longman's Building Construction.

The latest editions of the first two parts of Longman's Notes on Building Construction, formerly known as Rivington's, are a considerable improvement on previous editions. Whereas subjects were dealt with in an elementary way in the first volume, and further elaborated in the second, they have now been collected together so that joinery for instance may be found thoroughly treated in consecutive order in volume ii., while the subjects of walling and arches, brickwork, masonry, carpentry, roof coverings and constructional ironwork are found to be treated comprehensively in part i. This is a great advantage, for it gives a student a thorough grasp of each subject in all its bearings. The old method was traceable to the South Kensington syllabus, to meet which the work was originally designed, and was one of the chief faults of the system. The examinations have in the last two or three years been improved, and the text-books have had to follow suit. Longman's, notwithstanding the several books on construction which have been brought out, remains the best. The work is characterized by lucidity and scientific grasp of essentials, and reasons are carefully set forth and lessons drawn therefrom, wherein most other books are deficient. The chief criticism of the book must be that the revision has not been thorough enough in view of the advance in knowledge and methods in recent years. Engineers, physicists, chemists and others have added much to our store of knowledge that the building trade student of to-day ought to be instructed in. The volumes would be better rewritten—revision, however thorough, is not sufficient. The separation of information on materials into another volume prevents the proper development of the subject, as also the subject of calculations and stresses and strains to part iv. The editor has at last recognized the importance of the subjects of drainage, sanitary fittings, heating and ventilation, electric and gas lighting, electric bells, telephones and lightning conductors and has included chapters on these in part ii. These chapters are good so far as they go, but do not go far enough. The chapter on fireproofing systems is mostly out of date; some of the descriptions of systems could be eliminated and numerous others included. The whole subject of reinforced concrete is neglected.

"Notes on Building Construction," Parts I. and II. New editions, 1904. London: Longmans, Green & Co., 39, Paternoster Row, price 10s. 6d. nett. each.

"Mechanical World" Pocket Book for 1905.

With the current issue this useful pocket-book, now in its eighteenth year, is further enlarged. A table of trigonometrical ratios and formulæ, a section giving the squares, cubes and fourth powers of fractions, and a collection of powers, roots and reciprocals of factors often required for engineering calculations have been added, the matter on ball bearings has been revised, and additions have been made to the steam boiler and other sections. It is exceedingly cheap.

"The Mechanical World" Pocket-Diary and Year Book for 1905. Manchester: Emmott & Co., Ltd., New Bridge Street, price 6d. London Office: 118, Chancery Lane, W.C.

House Painting.

One generally has a prejudice against the small books published at a cheap price in blatant covers with catchy titles that pretend to instruct the public to do their own house-repairs as well as any trained craftsman, because for some reason they are usually written either by a journalist having only a smattering of the subject, who "cribs" his facts from some more or less antiquated technical book, and who is generally devoid of common-sense, or by workmen whose methods of expression are ambiguous in the extreme and whose attempts at "style" are elephantine, and whose colloquialisms and smart sayings betray inherent vulgarity. This present book, though it is intended for the same public—the small householder, the tenant and the farmer—does not, we are happy to say, suffer from these faults. It is well and clearly written and the instruction is on the whole practical and all that is necessary. The book is worthy of a better cover.

"The Popular Guide to House Painting, Decoration, Varnishing, Whitewashing, Colour Mixing, Floor Finishing, Paperhanging, &c.," by Herbert Arnold. Manchester: John Heywood, Deansgate and Ridgefield. London: John Heywood, 29 and 30, Shoe Lane, E.C., price 1s. nett.

Lockwood's Price-Book.

The 1905 edition of this hardy annual has just reached us. To the careful revision which each edition undergoes is to be traced its continuance in the favour of architects and builders alike. The classification of the work is most clear and the get-up pleasing, while the information given is most complete and easy of reference. It has often surprised us to find the estimating clerks to large firms of builders using price-books several years old. This in inexcusable considering the moderate price of "Lockwood's." Builders ought to pay more attention to se that their reference books are up to date for the expense is trifling and their valu inestimable—not only is the time of assistant saved, but money also, far exceeding th cost of the books. Failure is often traceabl to antiquated methods of estimating, &c that arise from a neglect of these obviou and seeming trifles.

Lockwood's Builder's, Architect's, Contractor's an Engineer's Price-book for 1905," edited by Franc T. W. Miller, A.R.I.B.A. London: Crosby Lockwoo & Son, 7, Stationers' Hall Court, Ludgate Hill, price 4s

LAW OF EASEMENTS.

A PAPER on this subject was read by Mr. Horace Wilson before the Sheffield Society of Architects and Surveyors last Thursday.

An easement, he said, imposed on the owner of the land subject to it only a duty to suffer something or refrain from doing something for the benefit of his neighbour; for example, the grantor of a right of way was only bound to allow the use of the way, not to keep it in repair; and similarly in the case of ancient lights he was only obliged to refrain from obstructing the light. The most important easements were those in respect of the right to support of land by adjacent and subjacent soil, the right to the use of drains and party-walls, and the right to light and air.

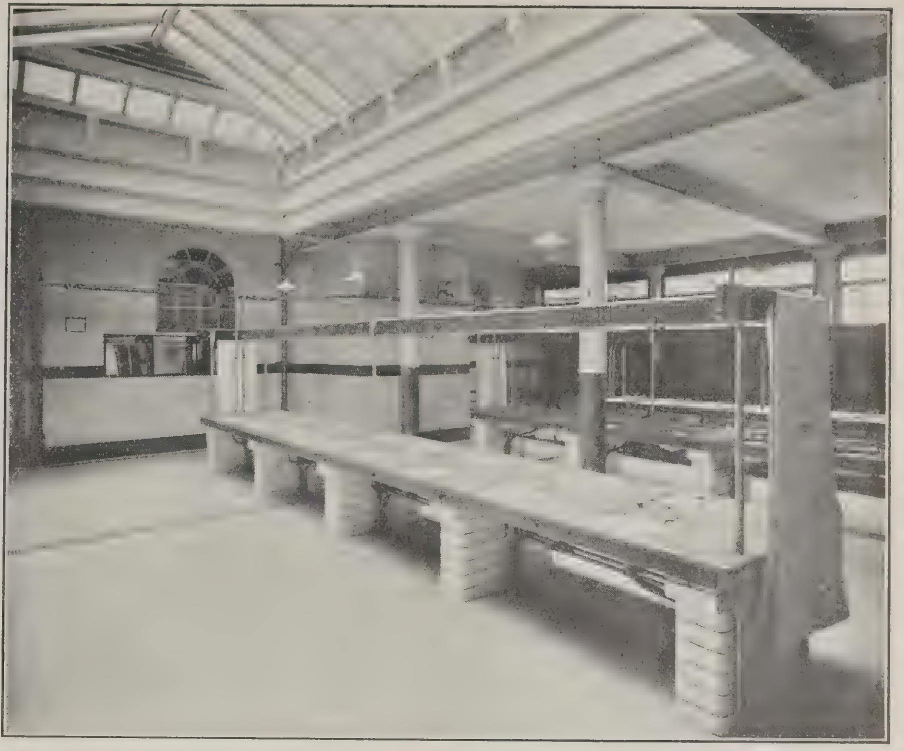
Excavations.

No man could, as a general rule, excavate in his own land, or work minerals, in such a way as to cause his neighbour's land to fall in; but the obligation to support as against adjoining land bound only so much of it as was necessary to support the land in its natural state. Nor did the right to support from subjacent soil prevent the adjoining owner from draining his land as he pleased. Neither of these rights was a right to have the whole or any part of the adjacent or subjacent soil left in its natural state, but simply a right not to have one's land injured by anything done, however carefully, in the adjacent or the under-lying soil. And this right, in its turn, might be subject to an easement in the adjoining owner to work in his land so as to cause a subsidence.

With regard to the right to

Support of Buildings

the main principle was that when anything had been done to increase the lateral pressure, as by erecting buildings, no man had a right to such increased support except for "ancient" buildings, *i.e.*, buildings at least twenty years old, for which the support had not been acquired by fraud, stealth, or the mere revocable permission of the servient owner. A grant of land, however, for the express purpose of building upon it created a legal easement to such an extent as might be necessary for enabling the grantee to build the premises and enjoy them in safety when properly built, but the owner of the house was not entitled to do anything to increase the burden on the other owner, and was bound to keep his house in repair. Again, the right to support of buildings by buildings might be acquired by prescription, provided that the adjoining owner was aware from the very nature of the building that support to it was necessary. An action would be for damage caused to a neighbour's building by negligence in law, but not always for negligence in fact; in other words, if there existed an easement of support, and the adjoining owner invaded that right, he would be liable in damages, however carefully he might have done the act complained of, but if not he would not be liable if he took proper care in the execution of the work.



DAVID LEWIS WORKMEN'S HOSTEL AND CLUB, LIVERPOOL: LAVATORIES IN BASEMENT.

Use of Drains.

The right to the use of drains now depended on the Public Health Act, which entitled every person within the district of a local authority to empty his drains into their sewers, upon complying with their requirements, and it provided a means of compelling local sanitary authorities to make a proper system of sewerage for their respective districts. The local authority was, under the Act, the sole judge of what was necessary for the proper construction and repair of all drains within its district. The Act gave very wide powers as to sewers, and the operations of local authorities in these matters too often had the evil results of causing persons whose lands were injuriously affected either to make unreasonable claims for compensation or to incur the expense, delay and annoyance of arbitration under the Act.

Easement of Light.

As to this, Mr. Wilson traced the alteration of the law under the influence of modern town life, and pointed out the tendency of the courts to restrict the easement to such an amount of light as was actually necessary for the user of the particular premises, rather than to confer a right to the continued enjoyment of all the light that had formerly had access to the building. The "45 degrees rule" was at first very much favoured, but it seemed to have fallen upon evil times latterly, and had recently been declared, in the Court of Appeal and the House of Lords, to be worth very little as a guiding principle.

DAVID LEWIS WORKMEN'S HOSTEL AND CLUB, LIVERPOOL: THE PUBLIC HALL.

An Historic Lincolnshire Tower.—The tower of St. Andrew's Church, Denton, near Grantham, was reopened last week after thorough restoration by Mr. William Weir, for the Society for the Protection of Ancient Buildings. The tower was built between 1350 and 1400 and is in the style transitional between Decorated and Perpendicular. A broad belt of brickwork has been built in the interior, the exterior has been re-pointed, the vane and pinnacles renewed, a lightning conductor placed in position, and the clock re-gilded. The cost has been about £900.

Keystones.

New Technical School, Burnley. — Mr. Pickles, borough surveyor of Burnley, has been appointed architect for this building at a fee of £600.

The new Associates of the Royal Academy will be elected this week from a list of 93 painter candidates, 17 sculptors and 39 architects. There is only one new candidate among the architects—Sir William Emerson.

New Premises for the Masonic Club at Norwich are to be erected at 47, St. Giles' Street from designs by Mr. Albert C. Havers, of Norwich (who was selected in local competition recently). The front elevation is Classic in character and will be carried out in Monk's Park stone and Portland stone.

Royal Gold Medal, 1905.—At the meeting on February 6th the Council of the R.I.B.A. will announce the name of the person they propose to submit to His Majesty the King as a fit recipient of the Royal Gold Medal this year. Members may submit names to the secretary up to January 23rd.

Municipal Architecture: R.I.B.A. Memorial.—At a meeting of the Watch Committee of the Birmingham Town Council last week the memorial from the R.I.B.A. and allied societies urging that architectural work should not be placed in the hands of engineers or surveyors was received, and referred to sub-committees.

Competition Reform Society.—The Committee disapprove of the conditions in the competition for a public elementary school at Preston, because the remuneration offered to the successful competitor is 5 per cent., including quantities. Members are requested to abstain from competing unless the conditions are satisfactorily revised.

Caversham Schools Competition. — The R.I.B.A. have been in communication with the Oxford Education Authority in regard to the conditions of this competition, which are unsatisfactory; the Authority, however, will only modify them to the extent of not requiring a detailed specification separate under the several trades to be sent, so that architects will do well to refrain from competing.

Henry Saxon Snell Prize.—The Royal Sanitary Institute has issued the general conditions for this prize, which was founded to encourage improvements in the construction or adaptation of sanitary appliances, and is to be awarded by the Council of the Institute every three years, funds having been left for that purpose by the late Mr. Henry Saxon Snell, F.R.I.B.A. The first prize, which will consist of £50 and a medal of the Institute, is offered this year for an essay of not more than 5,000 words on "Domestic Sanitary Appliances, with suggestions for their improvement," which is to be delivered by March 30th addressed to the secretary of the Royal Sanitary Institute, 72, Margaret Street, W., from whom all particulars can be obtained.

Alexander Thomson Travelling Studentship. This triennial studentship (value £60, and open to architectural students between 18 and 25 years of age residing in the United Kingdom) is to be again competed for this year, the drawings having to be submitted by December 28th. The subjects are (1) a study of a classic building (if specially prepared for the competition the subject is to be the Monument of Lysicrates) and (2) a design for a cascade and portico in a public park. The successful competitor is required to go on a sketching tour for three months, and the competitor placed second to spend three weeks in making drawings in the British Museum or elsewhere. Full particulars can be obtained from Mr. C. J. MacLean, secretary to the Trust, 115, St. Vincent Street, Glasgow.

A new Mortuary for Edinburgh is proposed to be erected at High School Yards at a cost of £4.000.

Northern Architectural Association.—Mr. J. Walton Taylor's presidential address, delivered on November 22nd last, has now been issued in pamphlet form.

The Decoration of a New Club was under discussion, when a member suggested the style might be Early Pullman or Late North German Lloyd!

A new Board School at Bathgate, Edinburgh, has been erected from designs by Mr. J. Graham Fairley, architect, of Edinburgh. It is two storeys high and has eight classrooms accommodating 480 children. On each floor is a hall 60ft. by 26ft. for drill and music lessons. The cost of the building has been £9,500.

R.I.B.A. Prizes and Studentships.—The annual exhibition of designs and drawings submitted for the R.I.B.A. prizes and studentships will be held, as usual, in the gallery of the Alpine Club (entrance in Mill Street, Conduit Street, W.), from Tuesday next, January 24th to Saturday, February 4th, from 10 to 8. The awards will be announced at next Monday's meeting of the Institute, and will be published in our issue for Wednesday next. The following works have been received:—Essay, 14; Institute Silver Medal, 17; Soane, 12; Owen Jones, 3; Pugin, 7; Godwin Bursary, 1; Tite, 19; Arthur Cates, 2; Grissell, 5.

Rural By-laws: Presentment to Mr. Justice Grantham.—At the Cambridge Assizes on Saturday the grand jury made a presentment to Mr. Justice Grantham, expressing their thanks to his Lordship for the determination with which he had brought before the country the many and great obstacles thrown in the way of cottage building in country districts by impracticable and unnecessary by-laws, and by the arbitrary way in which they were sometimes administered by those in authority. They trusted that the President of the Local Government Board would at an early date take such steps as might be necessary to remove those obstacles.

Victoria Station Front: A Protest.—In a letter to the "Times" the Architectural Vigilance Society protest against the proposed new front to Victoria Station. The following names are subjoined:—Lord Windsor (chairman), Lord Balcarres, Sir Edward J. Poynter, Sir W. B. Richmond, Mr. G. J. Frampton, Sir Aston Webb, Mr. W. D. Caröe, Prof. Beresford Pite, Mr. Henry T. Hare, Dr. G. Longstaff, Mr. M. H. Spielmann and Mr. H. H. Statham (hon. secretary). The design for the new front has been prepared in the engineer's office and the Society consider it to be "a huge mass of architectural commonplace." They have been in correspondence with the secretary of the company with the object of getting the design revised so as to be worthy of its important position. "The contrast is illustrated in the design which has been made for the wall, &c., along Buckingham Palace Road. This, though simple, is in good architectural taste, and no complaint can be made against it. If the same hand were allowed to recast the station front design, we might have something very much better at even less cost." In reply the railway company state that one of the building contracts has been signed and it is impossible now to make any alteration, and they add that the design has been prepared under the supervision of the engineer by a competent and trained architect. (The whole of the works have been designed under the supervision of Mr. Charles L. Morgan, M.I.C.E., the company's engineer, who has been assisted in the architectural design by Mr. C. D. Collins, M.S.A., chief of the architectural staff.)

Builders' Notes.

Dissolutions of Partnership. — Messrs. Huggins & Mason, builders, of Plymouth, have dissolved partnership; also Messrs. Godfrey Brothers, builders and contractors, of Seaford.

The Pronunciation of "Plumber" has drawn the "Chronicle" thus into verse:—

Plumber—spelled just so—my plumber,
You complain; and really I'm
Puzzled, be it spring-time, sumber,
Autumn, winter—for your rhyme.

Cheery, necessary plumber,
Welcomb guest at any time,
Welcomber than any comber,
Tell me—how is that for rhyme?—C.R.

Building Trades' Exhibition.—Lord Windsor, First Commissioner of Works, has promised to open the Building Trades' Exhibition, which is to be held in the Royal Agricultural Hall, Islington, from April 27th to May 6th next. The date of opening was originally fixed for April 29th, but owing to the demand for space the date has been altered.

Exhibition of the Decorative Trades in Edinburgh.—In connection with the annual general meeting of the National Association of Master-Painters in Scotland, which is to be held in March next, it has been decided to hold an exhibition of the decorative trades in the Waverley Market, Edinburgh, to be open from March 8th to 11th. A similar exhibition was held at Manchester in September last, and proved a decided success.

City Corporation and the Building Acts Amendment Bill.—At last Thursday's meeting of the Court of Common Council a letter was read from the London County Council asking the views of the Corporation with regard to the London Building Acts Amendment Bill. Mr. Deputy Wilkinson denounced the proposed measure as unnecessary, unjust and absurd. Its proposals were unbusiness-like and would produce chaos, and if such a Bill ever became law it would be the ruin of half the householders in the City of London. It was resolved that a small committee, composed of members of the City Lands, Bridge House Estates and Streets Committees, should be formed for the purpose of taking all the necessary steps to oppose the Bill.

Obituary.

Mr. Arthur Hunt, a well-known young builder of Burgess Hill, was found drowned last Friday in the Victoria Pleasure Gardens.

Mr. Thomas Fenwick, one of the best known civil engineers of the North of England, partner in the firm of Martin & Fenwick, Leeds, died last week, aged 80.

Mr. James Wiggins, of the firm of Wiggins & Co., lime and cement merchants, Hammersmith, who died on October 16th last, left estate which has been valued at £20,801.

Mr. John Williams, one of the veterans of the Newport (Mon.) building trade, died last Thursday in his eightieth year. He had been in Newport about sixty years, and in business as a builder and stone merchant about forty-three years.

Mr. Whitworth Whittaker, brickmaker, builder and contractor, of Oldham, who assisted in building the original railway station at Crewe and died on October 4th last, aged 80 years, left gross estate which has been valued at £90,079.

Mr. Thomas Fidler, builder and contractor, of Eckington and Sheffield, died on January 10th, aged 67. His firm—Messrs. James Fidler & Co., Ltd.—has built numerous churches and chapels and many important buildings in Sheffield, including the Lodge Moor Hospital: and is now engaged in erecting the new University College.

Electrical Notes.

The London Power Bills.

Ve referred a few weeks ago to the pro-
ed schemes for the supply of electrical
rgy in bulk to London borough councils,
ch schemes are to be brought before Par-
nent next session. In no country in the
:ld except this would there be tolerated
waste of time and of ratepayers' money
the part of opposing municipalities that
ains whenever any scheme of benefit to
community, but involving private enter-
e, is brought forward. As a consequence
the notice about the new Bills, a con-
nce of the London borough councils was
l last Wednesday at the Shoreditch Town
ll, at the invitation of the borough council
that ilk, "to consider what joint steps
uld be taken to oppose the passing into
of the proposed Bill of the Administra-
County of London and District Electric
ver Co., and other similar Bills affecting
ıdon boroughs, to be introduced in the
ııing session of Parliament." It will be
erved that these bodies do not meet to
sider the principle of opposition; that is
article of faith amongst municipalities.
first a resolution was moved "that this
ference do combine in a joint opposition
he following Bills,' &c., the mover being
chairman of the Shoreditch Electricity
nmittee; but no seconder could be found.
dently some of the delegates seemed to
e qualms about the advisability of spend-
ratepayers' money in opposing Bills that
not affect their own boroughs, and this
nion was voiced by the town clerk of
olwich and several others. Ultimately
resolution was altered and agreed to in
amended form, and to the effect that
y those borough councils affected should
ıtly oppose. Then the Shoreditch borough
:trical engineer moved that an executive
ımittee should be appointed to conduct
joint opposition, and the final motion put
ı cut-and-dried form the constitution and
ies of the committee, great caution being
iously taken in the wording. Then the
reditch town clerk got up and moved
hat it be referred to the executive com-
tee to consider the advisability of formu-
ng a municipal scheme for a large
erating station in the most favourable
ition for supplying electricity in bulk to
sting municipal electricity undertakings."
s audacious proposal, calling in mind
object of the conference, was even too
ch for the delegates, and was strongly
osed by the Woolwich town clerk, who
nted out that they were asked to do
very thing which it had already been
ermined they should ask Parliament not
allow a company to do. He regretted
resolution, "as it would undoubtedly
l its way to the knowledge of the pro-
ters of the Bills and be used against them
the committee rooms." No doubt it
l, and we hope with success. Finally this
lution was withdrawn. Other resolutions
unimportance were passed, and this
itantly municipal conference was also
ed to include in the measures to be opposed
London Gas Bills and the Pneumatic
patch Company's Bill, but these pro-
als were ruled out of order. It is really
lisgraceful scandal that such advantages
he community as cheaper electrical energy
t can be supplied by the small municipal
ions should be opposed simply in the
erest of a fad. But so long as borough
ncils are composed of the class of men
v returned—or, to put it another way,
long as the ratepayers will put up with
sort of thing, and not return capable
n of business—so long we suppose will
remain behind every other large city
foreign countries, where neither muni-
alities nor vested interests have the power
evil possessed here. A.M.I.E.E.

Law Cases.

Architects' Offices: Interesting "Light" Case.—In the King's Bench Division of the High Court of Justice on Saturday the case of *Ambler* v. *The Bishop of Leeds* was heard. The plaintiffs were the owners of a block of property in Cookridge Street, Leeds, and it was contended that by the erection of the new Roman Catholic Cathedral opposite, the light to the plaintiffs' premises had been materially diminished. Evidence showed that the light to the ground floor had been altered, but with regard to the first floor, which was occupied as an architect's office, the matter was in dispute. The umpire, however, to whom the case had been submitted, held that "notwithstanding the defendant's buildings, there remains sufficient light to the plaintiffs' premises for all purposes of ordinary user, and the plaintiffs are not entitled to damages for interference with such ordinary user, but if I am entitled to take into account the damages which the plaintiffs have sustained in respect of loss of light to those parts of the said premises used for occupation in which a special amount of light is required, then I award £600 damages to be paid by defendant to the plaintiffs." The umpire added that "at the request of both parties I submit for the opinion of the Court above whether, on the foregoing facts, I am bound by the decision in *Home and Colonial Stores* v. *Colls*, and therefore cannot award damages to the plaintiffs, or whether I can award damages in respect of interference with such special user of light as aforesaid." The point the plaintiffs wished to raise was whether or not an architect occupying premises and only requiring such an ordinary amount of light as any ordinary architect needed was entitled to have his business included within the category of special businesses.—Mr. Justice Day reserved judgment.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

THE annual dinner of the Leeds and Yorkshire Architectural Society was held on Thursday last, the president (Mr. G. Bertram Bulmer) occupying the chair.

In proposing the toast of the Royal Institute of British Architects Dr. Bodington (vice-chancellor of Leeds University) said it was seventy years since the first meeting of the Society of British Architects was held; the first president (Earl de Grey) was not a professional man, but one of those amateurs who were useful intermediaries between the expert man on the one hand and the outside world on the other. Speaking of the architecture of cities, Dr. Bodington said he thought it was greatly to the credit of the London County Council that in a place where land was so valuable those two precious churches of St. Clement Danes and St. Mary's, Strand, should have been spared, and that they should see them unencumbered and unhampered by buildings. He would be very glad to see municipal authorities having more control over the height of buildings and more control over the character of the advertisements with which they might be beautified—or disfigured; he thought it likely that more attention would be paid by municipal authorities to the opinion of such bodies as the Royal Institute of British Architects and the Leeds and Yorkshire Architectural Society.

Mr. Alfred Darbyshire responded to the toast, and said that one of the wisest things the Institute had ever done was to open its arms to the brethren in the provinces. The question of the registration of architects he regarded as the most vital point that had arisen in the profession in his lifetime. The Institute must be the moving power in carrying this matter through the House of Commons.

The toast of "The Allied Societies" was given by Mr. W. J. Locke, who mentioned that in July next year London would be the scene of an international congress of architects.

In responding, Mr. J. W. Beaumont spoke on the question of registration, and said that, whatever the decision of the Institute in the matter, he would abide by it loyally, believing that the decision—after the exhaustive enquiry into the subject—would be the correct one. He himself believed that registration would raise the status of the architect and would give him a position before the public.

The toast of "The Houses of Parliament" was proposed by Mr. Butler Wilson, who also devoted his remarks to the subject of registration. Mr. R. H. Barran, M.P., responded to the toast, and referring to this same matter said that if the Institute was unanimous in its support there was every reason why the Bill should go through, and every prospect that it would.

The Lord Mayor proposed "The Leeds and Yorkshire Architectural Society," and referred to the architectural transformation of Leeds in recent years. Mr. Bulmer replied, giving a sketch of the history of the Society from its inception in 1876 down to the present time.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

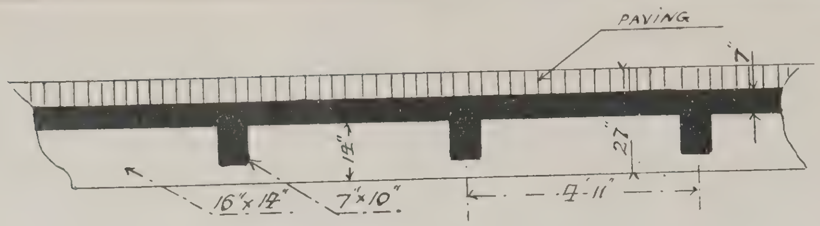
Best Books for R.I.B.A. Intermediate.

AYR.—SUBSCRIBER writes: "Which are the best books to study for the R.I.B.A. intermediate examination? I have a list, published by Batsford, of the books recommended by the Institute, but would like to know which are the most suitable. Is Taylor & Cresy's 'Rome' the best book to draw the Orders from? Which parts of Glasgow Cathedral would you advise me to measure for my Gothic sheets?"

The best books to study for the R.I.B.A. intermediate examination are as follows:—Banister Fletcher, "History of Architecture on the Comparative Method"; R. Phené Spiers, "The Orders"; John Perry's "Applied Mechanics" or Goodman's "Mechanics applied to Engineering"; Spanton, "Complete Course of Geometry" (large edition); Longman's "Notes on Building Construction," and separate books on various classes of materials, the names of which will be found in our book lists. The Orders might very well be drawn from Taylor & Cresy's "Rome," but it is an expensive work, and Spiers's "Orders" would give you all you require, unless you happen to have a copy of the former work. The R.I.B.A. list of books is not satisfactory. There are many fine doorways at Glasgow Cathedral and some excellent work in the chapter-house, but you will probably find that the choice of a subject for measuring is determined by the lengths of the ladders procurable at or near the cathedral.

Ancient Lights.

LONDON, N.—F. S. writes: "A has a building two floors high with ancient lights overlooking B's back garden. A pulls down his building and erects another, setting back the new one level with the old building, but at the same time A's new building is carried up another storey and new windows are also put in and the ancient ones enlarged. Has



MARKET-PLACE ON REINFORCED CONCRETE AT ROCHDALE.

B any claim on A? If it can be shown that B's property is decreased in value by A's building, has B a right to compensation? Can you name some books that deal with cases of this kind?"

By building along a new frontage line A has abandoned the right of light possessed by his old windows, and B may prevent him from acquiring a similar right for the new windows by erecting a permanent obstruction on his own land at any time within nineteen years from the date of their being opened. B has no claim whatever upon A, having no ancient lights which A has obstructed. Obtain Fletcher's "Light and Air" or consult Steven's "Commentaries." M.

Admiralty Engineers.

Sale.—Architect's Assistant writes: "In the examinations for Admiralty engineers does the student have to pass in both engineering and architecture, and if so what books would you recommend for the engineering papers?"

Architectural and engineering drawing being grouped together, it is only essential to qualify in the group as a whole. On the other hand, to merely aim at a "pass" in a competitive examination is one of the surest means of securing failure. On the present occasion about twenty-five candidates are competing for two vacancies. It is obvious that only the two men who obtain most marks can succeed, although probably fifteen out of the twenty-five will qualify in all the groups; and under such circumstances it is just as bad to be third, even if only two marks behind the second, as to be last on the list. Every single mark is of the utmost importance; therefore no subject can be neglected with safety. There is, however, no likelihood of another examination being held for a few years, so that there is plenty of time for studying engineering by the only proper method—practical experience. G. A. T. M.

Cost of Board Schools.

London, E.C.—L. A. H. writes: "In a list of approximate prices published in your columns some time ago you put Board schools at 6d. to 8d. per foot cube. Do you think a one-storey school could be erected near Reading at 6½d., with central hall for boys and girls, hall corridor for infants, and the minimum accommodation; all in general very plain?"

The average of twenty London Board schools on the basis of 8 sq. ft. per child came out at the rate of £17 13s. 9½d. per head. A one-storey Board school as described could hardly be built for less than 7½d. per foot cube, but it would depend upon circumstances. See Rea's "How to Estimate" (7s. 6d. from these offices) for many other particulars. HENRY ADAMS.

Workhouse Infimaries.

A Subscriber writes: "Is it possible to erect a workhouse infirmary at a cost less than £90 per bed, with administrative accommodation fitted up with modern sanitary accessories which will meet the requirements of the Local Government Board?"

According to Rea's "How to Estimate" the Axbridge infirmary for workhouse, Somerset, cost £5,720 in 1902 for sixty beds, or £95 per head; the Cannock infirmary for Board of Guardians, Staffordshire, in 1901, for forty-eight beds, £96 per bed; the Shipton infirmary adjoining the workhouse, in 1901, £4,300, or £90 per bed; the Solihull workhouse infirmary and tramp wards, in 1901, with eighty beds, £85 per bed; the St. Pancras infirmary, Highgate, built many years ago, £68 per bed (a very plain building, however). At the other end of the scale are West Ham, £277, and Willesden, £245 per bed. HENRY ADAMS.

"Market-place on Girders and Concrete."

Referring to the recent enquiry under the above head, and the reply of Professor Adams thereto, Mr. Cecil Cary Markham, civil engineer, of Darlington, draws attention to a work of similar nature recently carried out at Rochdale, where Mr. S. Sidney Platt, M.I.C.E., adopted ferro-concrete construction (Hennebique) for covering in the River Roch, with very satisfactory results. The accompanying part cross-section illustrates the method adopted. "This system," adds Mr. Markham, "has the advantage (1) of not offering any steel surface to be acted upon in a damp situation, thereby eliminating cost of upkeep, and (2) of being cheaper than the scheme outlined by Professor Adams. The contractors for the work were the Yorkshire Hennebique Contracting Co., Ltd., of North British Buildings, East Parade, Leeds."

Books on Engineering Drawing and Design.

Whitley Bay. — Inter writes: "Please name some suitable books for 'Engineering, Drawing and Design' in the London University Intermediate B.Sc. examination. Students are expected to be familiar with the principles of orthographic and oblique projection, and to answer simple questions upon colouring and shading, and upon arrangements and proportions of rivets, screws, bolts, nuts, flanges, plummer-blocks, brasses, &c. I am attending second stage machine draw ing, South Kensington, and supplementin it with private study. We use Low & Bevis' 'Machine Drawing,' but I desire a book t cover projection, colouring and shading."

The best text-books for any examinatio depend upon many circumstances, amon them being the aptitude of the student an the time at command. With sufficient tim the best book for this examination is Wells' "Engineering, Drawing and Design" (Griffi & Co., Exeter Street, Strand, vol. i. 3s vol. ii. 4s. 6d.). For the preparation drawings see "Class Notes in Technic Drawings" (Adams, 60, Queen Victori Street, 6d.) and "Draughtsmen's Work (Cassell & Co., 2s.). The books with illu trations of colouring and shading are a expensive. The best is Armengaud's, but is not often seen nowadays, as machi drawings are rarely finished in an artist manner. HENRY ADAMS.

Water Filter for 1,800 Gallons a Day

White Heather writes: "What wou be the best size and description of an econ mical and efficient filter for supplying 1,8 gallons of water per twenty-four hours? rough sketch of the construction would helpful."

The description of what is required is meagre that it is difficult to frame a usef reply. The whole circumstances should ha been stated as completely as possible. suming that ordinary river-water is to dealt with, and that there is convenience the construction of a sand-filter and app tenances, the arrangement might be as sho by the accompanying illustrations, Fig. being a plan and Fig. 2 a section. settling tank is required to get rid of grosser particles and the mud brought do in time of flood. The filter must be duplicate so as to allow of cleaning with stopping the supply, and a reservoir of pu fied water must be provided in order t pumping may be done in the daytime, thou filtering may proceed all night. Assumi a filtering capacity of 500 gallons per sq. per twenty-four hours, the area of each fi must not be less than $\frac{1800}{500} \times 9 = 32{\cdot}4$ sq. or say, 8ft. by 4ft. at the surface of the sa The walls may be of concrete and the arc of brick or concrete. A pump may st over the reservoir. HENRY ADAMS

WATER FILTER FOR 1,800 GALLONS PER DAY.

SANITARY AND LECTRICAL REQUIREMENTS IN HOSPITALS.*

CHARLES T. WALROND, A.M.I.C.E., A.M.I.E.E., M.S.I.,
isulting Engineer to the Hospital for Sick ildren, Great Ormond Street, London, W.C.

SHALL first deal with the requirements of hospitals in respect of water supply. e great majority of the London hospitals dependent for their supply of water upon or other of the eight London water comnies, and we may therefore in the first tance consider whence this water is obned and how it is treated before it is ivered at the hospital.

Thames Water.

The water which is abstracted from the ames is taken from the river in the neighurhood of Hampton, Sunbury and West lesey, and is in the first instance passed o subsidence reservoirs, where it is allowed stand in order that the matters in suspenn may settle to the bottom. The clear ter is drawn off and passed on to filters, ich as a rule are constructed of layers of id and gravel formed into beds varying thickness from 2ft. 9ins. to 8ft. The arser gravel is placed at the bottom, and finest sand constitutes the surface. The iter drawn from the River Lee is similarly ated.

When the Thames is in flood and its waters turbid, it becomes desirable to close the akes, but the length of time during which is is possible clearly depends upon the rate which water is being consumed and the pacity of the reservoirs. Too often it is t found practicable to keep the intakes m the river closed as long as could be shed, and the quality of the water supplied ffers accordingly. Moreover, in times of ere frost the action of the filters is intered with by ice. It will be seen, therefore, at the purity of the water is not uniform.

Sand Filter Beds.

The tests usually applied to water to ascerin its purity are either chemical or bacteriogical. All water contains bacteria, and as rule by far the largest proportion of them harmless, but the purer water is rendered filtration the fewer are the bacteria found it. In the process of purification more than per cent. of the bacteria of the Thames ater are eliminated. Some of them are rried down in the subsidence reservoirs ith the particles of mineral matters in susnsion as these settle, but by far the larger mber are strained out by the sand filters. hen a sand filter has been at work for some tle time it is found that the top layer comes covered with a slimy film of living getable matter, and it has been proved at it is this film which is most effectual in iminating bacteria from the water. As the m grows in thickness it offers increasing struction not only to the microbes but so to the water itself until the rate of tration becomes altogether too slow. It then necessary to scrape this film off, and ith it a thin layer of the sand on which it sts.

With good sand filtration it is generally ssible to reduce the number of bacteria in ater to about 100 per cubic centimetre,† hich is very commonly taken as the standard purity from a bacteriological point of ew. This, however, is a perfectly arbitrary andard, and if any considerable percentage the 100 bacteria per cubic centimetre hapned to be of the kind that produce, say, phoid fever, they would be capable of using a most serious epidemic.

Wells.

Several of the companies supplement their supply of water from wells, and, as a rule, the water being so much purer than that from the river, it is not found necessary to pass it through subsidence reservoirs.

The Kent Water Co. derives its supply wholly from wells, and this supply, which is the purest public supply in London, is not even subjected to filtration.

When water is obtained from wells in London, these wells must be carried down through the bed of clay which underlies the metropolis into the chalk formation, as the water which in places is met with in large quantities at a few feet below the surface is quite unfit for drinking or cooking purposes. The bed of clay which has to be penetrated in well-sinking is of an average thickness of about 400ft., but when it is once pierced the water rises from the chalk to within about 80ft. of high-water mark at London Bridge.

Some of the London hospitals, such as Guy's and St. George's, have their own wells, and I cannot help thinking that it would be a wise policy on the part of other hospitals to follow their example, as the cost of pumping is not great, and where steam boilers of sufficient power are already provided the initial expense of the installation is reduced.

Raising Water by Compressed Air.

The most modern method of raising water is by the use of compressed air. A small pipe, say 1in. or 1½ins. in diameter, is passed down the bore pipe to the well below the surface of the water, and through this air under pressure is forced. It might have been supposed that the air would merely bubble up through the water, but as a matter of fact, when properly arranged, it lifts the water with it as it rises so that the bore pipe is filled with a continuous stream of water mingled with air which passes into the storage tanks.

This system possesses the advantage that there is no necessity for a pump in the borehole, some hundreds of feet below the surface, which has to be drawn up from time to time for repairs, and it possesses the further advantage that much more water can be obtained in this way from a bore pipe in a given time than by any other means.

Cisterns.

Having now glanced at the sources whence our supply is obtained and the measures which are adopted for rendering it wholesome, let us consider how we are to deal with it when it is delivered at the hospital.

Since all water companies occasionally shut off the water for repairs to their mains, it is necessary for a hospital, unless it is prepared to run the risk of finding itself temporarily without water, to provide cisterns of adequate capacity for emergencies of this kind. To be obliged in a severe winter to draw the fires of the boilers upon which you depend, not only for your supply of hot water and your steam for cooking but also for much of the warming of the building, and possibly, too, for the supply of electricity for lighting, is not a pleasant prospect, and therefore more or less storage of water upon the premises is a necessity.

An Automatic Alarm

to call the attention of some responsible person directly the water is shut off is desirable, especially where the cistern storage is small. At the Hospital for Sick Children we have experienced the value of this piece of apparatus, which is fixed in the boiler-room.

As to the quantity to be stored, it will probably be found sufficient if provision is made for one full day's supply, but it is better to err on the safe side, especially when possible extensions of the hospital buildings are considered. I am afraid, however, that there are very few hospitals in London which have storage capacity for this amount.

Requirements of Storage Cisterns.

Wherever it is possible the storage cisterns in a hospital should comply with the following conditions:—

(1) They should be two in number and should be placed at a sufficient height to command the whole hospital.

(2) They should be of equal size and so arranged that each of them supplies approximately one-half of the hospital.

(3) They should be so arranged that when it is necessary for either of them to be cleaned out the other one will supply the whole hospital temporarily.

(4) They should consist of closed tanks so that all dirt, as well as birds, mice, &c., may be excluded.

Every storage cistern over and above the two which are indispensable involves extra labour for cleaning and additional valves to be kept in repair.

Defects of Small Cisterns Connected.

It is a very common but unsatisfactory arrangement to fix two small cisterns instead of one large one and connect them together on the same level so as to form a single cistern in two sections. Where this is done the cistern which has no ball valve almost invariably gets covered with scum on account of the want of proper circulation of the water, and this scum in certain cases, when allowed to accumulate, becomes exceedingly foul. Where it is absolutely necessary to use two cisterns in this sort of way, one of them should be placed above the level of the other, so that all the water passes first into the upper cistern and from it into the lower one, the supply pipes to the building being taken off the latter.

The companies under their Acts of Parliament are not bound to supply water to an unlimited height, and therefore in some cases it may be found that the pressure in the mains is insufficient to charge cisterns which are situated at the top of the building. Where this is the case it becomes necessary for the hospital to pump.

My experience confirms what might have been inferred from the rapid increase of the population of London, that the pressure in the companies' mains has in some places, at any rate, somewhat diminished during the last few years, so that storage which used to be sufficient has had to be increased.

Supply of Water to Operating Theatre.

Although the supply of water as delivered by the companies is suitable for most hospital purposes, it is frequently considered desirable that the supply to the operating theatre should be perfectly free from bacteria, and this can be accomplished in three ways—either the supply of water may be passed through a filter the pores of which are too small to permit the microbes to traverse them, or the water may be raised to a sufficiently high temperature to destroy the bacteria, or the bacteria may be destroyed by impregnating the water with ozone—a method recently introduced on the Continent. The first method is the one most generally favoured, and the kind of filter usually adopted for the purpose is the Berkefeld. The filtering material of the Berkefeld filter is a fossiliferous earth of great porosity which is moulded into the form of a hollow cylinder. One or more of these cylinders or candles, as they are frequently termed, are enclosed in a metal case to which the water to be filtered is admitted through a pipe. The cylinders are closed at one end whilst the other is fitted with a metal cap having a nozzle that projects watertight through the external case. In addition to periodical cleaning, which is done with a piece of loofa, the cylinders should be boiled for an hour every other day if they are to be kept really germ-proof.

A combination of a small steam heater and filter has quite recently been introduced with the object of providing a constant stream of sterile water of any desired temperature in the operating theatre.

---

* A paper read before the Hospital Officers' Assoation.

† A cubic centimetre is equal to about a quarter of a aspoonful.

Drainage.

It is needless for anyone nowadays to insist upon the duty of maintaining the drainage arrangements of a hospital in a satisfactory state, for this is recognized on all hands, but I take it that what the board of management of a hospital want to know is:—

(1) Can drains be constructed in such a way as not to readily become defective, as they too often do?

(2) Can we periodically assure ourselves that our drains continue to be in good order?

Well, I know some drains that have been in constant use since the year 1876 which to-day are quite sound, and I know others that were laid in 1884 to which the same remark applies; the former are at one of the large public schools and the latter at the Hospital for Sick Children. In each case practically every other section of the drainage system of which they formed a part has become faulty, and the greater portion has had to be renewed.

The drains which have survived are constructed of cast-iron and the drains which have perished were of glazed ware, and, though I am bound to add that at the hospital we have one length of old iron drain which is not quite sound, yet to my mind this evidence is so thoroughly convincing that I have no hesitation in insisting upon cast-iron drainage wherever durability is required.

I now come to the second question, namely, whether it is possible from time to time to make sure that the drains of a hospital are sound. Certainly this is possible, but only if your drainage system has been so designed that it is practicable to apply positive tests.

Positive and Negative Tests.

To test the drains of a hospital when it is empty is one thing; to test these same drains when the hospital is in full work is altogether a different matter.

In the great majority of cases, unless a drain is hopelessly bad, it is quite possible by a judicious selection and application of the test to obtain any result you may desire. That is to say, if you apply what I term a positive test, such as the water test or the air test, and apply it properly, you will prove a faulty drain to be faulty, but if you apply a chemical test or a smoke test you may fail to detect the leak and therefore imagine that the drain is sound when it is not. These latter tests I term negative tests, because the evidence they afford of the soundness of a drain can only be of a negative character.

Unreliability of any but Positive Tests.

A glaring instance of the dangers incurred by placing reliance on any but positive tests came under my notice a few years ago. I was instructed by a prospective tenant to report upon the sanitary arrangements of a London house. A day or two before I made my survey the landlord asked the chief sanitary inspector for the district to examine the house, and he gave a written certificate on the official paper of his vestry in the following words: "In answer to your letter of the 2nd inst., I have to inform you that I visited the above premises and found the sanitary arrangements in good working order." My survey revealed the fact that not merely the house drains but also the public sewer itself were ventilating inside the building, and I had to condemn the house as dangerous to health. It turned out that the inspector, to use the words of the medical officer of health, "having applied the chemical test and not getting any result believed the sanitary arrangements to be in good working order."

I do not think I need say a word more to show that a test which does not give a positive ascertainable result is of no real value, and if relied upon may be very misleading.

Conducting Tests without interfering with working of Hospital.

Now what has all this to do with the question as to whether it is possible at any time to ascertain the truth as to the condition of hospital drains? If a negative test is not to be depended upon, it may be asked why not apply a positive one and settle the matter? I can answer this best by repeating what I was told at one of the large London hospitals only a few weeks ago, and this was that though they were so particular as to have the drains regularly tested every quarter, yet the water test was not used for the simple reason that *in order to apply it, it would have been necessary to stop the working of the hospital.*

The whole sewage of this hospital is discharged through a single main drain, and since it is essential for a drain or other pipe to be thrown out of use during the time that it is being subjected to any positive test, the application of such a test in the daytime would have been impracticable. That is why I have said that the possibility of being assured periodically that the drainage is sound must depend upon the way in which the system of drains is laid out, and you will see at once that for testing purposes it is necessary, in the case of a large hospital, to have several outfall drains to the sewer.

Expansion of Clay.

I now want to draw your attention to certain points which materially affect the durability of drains. One point of great importance, which nevertheless so far as I know has never yet received proper consideration, is the expansion and contraction of the soil in which the drains are laid. The great force exerted by the expansion of clay may perhaps be realized from a consideration of a case which was brought under my notice a few years ago by an eminent architect who was called in to report upon a church the chancel of which was separating from the nave. His idea at first was that the weight of the nave, which was the heavier part of the structure, had caused it to settle, but examination showed that it was the chancel which had sunk. The cracks in the walls were watched, and after a time it was found that the chancel had risen again. The cause of this curious action proved to be solely the fact that in getting out the foundations the excavations for the nave had been carried down deeper than for the chancel by about 18ins., and sufficient power was exerted by the expansion of this 18in. layer of clay to lift the whole chancel bodily.

Now drains as a rule are near the surface at their upper end and considerably deeper at their lower end, especially when they are laid of considerable length, and if they are laid in a clay soil it will be seen that they must be exposed to severe strains when the clay expands, this expansion taking place to a greater extent near the surface, where it more readily become dry and moist according to the weather, than at a depth of 5ft., 6ft. or more from the surface. This difficulty may be overcome by excavating your drain trench to a uniform depth and filling it in with concrete, the upper surface of which is given a slope corresponding to that required by the drain. Where this is done the thickness of the clay below the drain is everywhere kept equal, and moreover the pipes are given a very strong foundation. In a good many parts of London the surface is sand or gravel, and it is a matter of common experience that the drains in such a soil stand very much better than those laid in clay.

Frost.

The expansion of clay soil may be caused, however, not only by moisture but by severe frost, and in a hard winter we had some years ago I was very much struck with the number of paving stones recently laid which were lifted out of position, and in man cases broken right across. This action I a inclined to think takes place in soil whic is not of a heavy clay character, for met with an instance where a drain whic was laid just below the surface of a lawn Farnham Castle was cracked in two exactl where it entered one of the massive wall Here there could have been no question the fracture being caused by settlement of th building, and it must, in my opinion, hav been due to the expansion of damp soil in hard frost.

Injury to Drains by Settlement.

The settlement which always occurs mo or less in a new building is a common cau of injury to drains, but now that the Lond County Council have in their new by-law provided that all drains passing throug walls must be left free, it is to be hoped tha some improvement in this respect will, London at any rate, be effected.

Joints.

A third cause of injury to undergroun drains is the quality of the cement used making the joints. Portland cement as comes from the manufacturers is as a rule to "hot" for use, and if employed before it ha properly cooled down the subsequent expan sion which occurs will fracture the pipe I have known of at least three cases wher after the drains had been tested and covere up, the socket of each pipe has been burst in this way. This shows the necessity insisting upon drains being tested by th builder some months after he has finished th work, and of holding him responsible f them until they have stood this final test.

Iron drains are jointed with molten lea and not with Portland cement, and th danger I have spoken about refers exclusive to glazed-ware drains.

Damage to Drains by Steam and Hot Water.

The fourth cause is the turning of steam large bodies of hot water into the drain which has a good deal to do with the rap deterioration of stoneware pipes.

The fifth common cause of injury to drai to which I shall refer is that occasioned by th being tampered with in an unauthorized wa Steam fitters are great offenders in this respe An order is given for, say, a steam hot pla or some other apparatus heated by steam, a probably it is not thought for a moment th there is any necessity for considering t safety of the drains when so doing. Ho ever, the fitter requires some means of getti rid of the condensed steam from the hot pla and without saying a word to anyone knocks a hole in the nearest drain. Seve cases of this kind have come under notice.

Of course this sort of thing ought to impossible in any hospital which has works department, for then either the fitti would be entirely executed by the depa ment or else it would be carried out un the eye of the clerk of works.

Maintaining the Drainage System.

I now come to the question of maintain the drainage system in proper order.

As to design, there are five points whic consider practically axiomatic, but they ha not so far been deemed by the Lon County Council of sufficient importance any by-law to be made concerning th These are :—

(1) That the drains should be as small possible, because small drains are more rea made self-cleansing than large ones.

(2) That branch drains should be kep short as possible, so as to provide as li storage capacity as may be for foul air.

(3) That drains should have as few trap openings as possible, because the smaller number of gulleys the greater the quantit liquid which each of them will have to ta and consequently the better they will flushed.

(4) That no trapped gulley in direct comunication with the drain should receive erely rainwater or surface water, because dry weather, owing to the partial evaporaon of its contents, a rainwater gulley will rovide an outlet for any foul air which may xist in the drain to which it is connected.

(5) That iron drains, where they pass rough manholes, should be provided with on inspection chambers fitted with airtight overs.

Even where the drains are laid in cast-iron is very common for these airtight inspection hambers to be omitted, and as a conseuence the brick manhole, instead of being erely an access chamber to the drain, beomes an expansion of the drain itself, which filled with air of as foul a character as hat which may happen to be in the pipes.

Outlets from Baths.

In order that the drain may be as selfleansing as possible it is most desirable that baths should be fitted with large outlets nd arranged so that the waste water from hem may flush as great a length of underround pipe as possible. I have found it ery advantageous also to collect waste water rom any hydraulic lifts into an automatic ush tank at the head of the drain, so that his water, instead of flowing away by riblets, may be collected and discharged in ulk for flushing purposes.

Flushing and Inspection.

It is commonly supposed that if drains are o be kept in thorough order they should be egularly flushed out every three months or ven oftener and the manholes opened and leaned, but a drainage system must have een constructed very badly indeed if all this ttention is requisite, and I think it must be bvious that to have all the manholes, and articularly any that may be inside the uilding, opened quarterly is very unwise where it can be avoided, as such a proceeding ffords the opportunity for foul air to be isseminated within the hospital.

Drains from Kitchen and Scullery.

The only drain where there need be any anger at all in maintaining cleanliness is he one from the kitchens and scullery, and ere an automatic flush tank should always e provided instead of the old-fashioned nsanitary grease trap. I believe that if an utomatic tank were charged with hot water o difficulty would be found on the score f grease, but I have not yet tried the xperiment.

Most London hospitals, I believe, have the rains periodically tested, and where the rains are of iron, and are fitted with iron nspection chambers, the tests can be carried ut without the necessity of opening more han a small proportion of the manholes.

In order to permanently secure sound work t is most necessary that stringent tests should e applied during construction, and that the aterials used should be of the best quality.

L.C.C. By-laws.

The London County Council has issued y-laws to which all new sanitary work within the county of London must conform, nd the well-nigh universal opinion is that hese by-laws embody an ideal of perfection eyond which it would be folly to attempt o go, whereas the real fact is that they are ntended to represent not the maximum but he *minimum* requirements of sanitary science. This ought to be evident from the circumtance that they are enforced not only in he houses of the wealthy but equally in he humblest dwellings of the poor, and ospitals, therefore, should on no account eel that in sanitary arrangements they are up to date merely because they are not ummoned for a breach of the by-laws.

Pipes above Ground.

It is rather curious that whilst, as I have xplained, so much misdirected energy is xpended upon cleansing underground drains, no care seems ever to be bestowed upon the pipes which are above ground and which must, many of them, of necessity get much more foul than the drains themselves.

Here I consider that periodically a plunger should be drawn through such pipes from the top to the bottom to cleanse them of their impurity, whilst disinfectants may also be used with advantage during the operation.

Vent Pipes.

Drain ventilating pipes may be thought to be strange places for birds to choose in which to build their nests, but when they get the chance they often make use of them in this way. Both in London and in the country it is well therefore that the upper open ends of such pipes should be provided with a wire cage to prevent them being blocked.

Iron ventilating pipes, unless galvanized or otherwise protected against corrosion, frequently become choked with rust. The interior of the pipe being constantly exposed to moist air, becomes oxidized, and the rust falls in powder, collects where there is a bend, and renders the pipe useless for ventilating purposes. Care must be taken that where ventilating pipes terminate at the roof they should not do so too close to the chimney pots, or in the event of down-draught through one of the chimneys foul air may be drawn into the building.

Anti-syphon Pipes.

It is usually impossible to apply any really satisfactory test to the pipes which are known as anti-syphon pipes. In most cases they form a loop on the main soil or waste pipe, and then nothing short of cutting them at both ends and drawing a plunger through will prove they are free from obstruction.

During recent years very great improvements both in design, construction and arrangement of sanitary appliances have been introduced, and without going into details I propose briefly to indicate points which ought to receive attention.

Building into Walls.

One great object to be aimed at is to have everything as simple as possible, and also thoroughly open to view, so that dirt, which generally requires to be seen before it is removed, may be deprived of hidden lurking places.

As far as may be, every sanitary appliance should be built into the wall, and where this is not practicable it should be supported on light steel bearers projecting from the wall as brackets, or, in the case of baths, supported upon plain cylindrical feet at least 6ins. high. It facilitates cleanliness if all surfaces are white and if they are thoroughly well glazed.

In former times every sink had a wooden cupboard below it, but such cupboards should not be tolerated anywhere as they are almost invariably made receptacles for damp cloths and odds and ends which it is desired to put out of sight.

Fixing Sinks and Lavatory Basins.

At the present time there is a great fashion for fixing sinks and lavatory basins a few inches away from the wall, there being a prevalent idea that this arrangement favours cleanliness, whereas, as a matter of fact, it provides two extra surfaces to be cleaned, namely, the wall behind the appliance and the back of the appliance itself, and it provides these two surfaces where they are screened from observation. By building a sink into the wall and keeping the face of the wall flush with the inside, these two unnecessary surfaces are abolished.

Overflows.

The question of overflows is a difficult one. Most overflows are wholly uncleanable, and are liable to become very foul and offensive. Where they are cleanable it is difficult to get them attended to properly. On this account my practice now is to dispense with overflows wherever possible; this can always be done where the floor of the apartment is of terrazzo or other impervious material.

Floor Channels.

It simplifies matters very much if sinks, baths and lavatory basins are made to discharge into a channel in the floor, because then it is possible to dispense with traps and anti-syphon pipes, and to arrange the waste pipes so that they can be thoroughly cleaned. Where this method is adopted the channels as far as possible should be open and should have a good fall to a trapped outlet close to the external wall.

I noticed in a recently constructed operating theatre, where a system of floor channels is adopted, that the channels were raised above the floor level, presumably with the idea of preventing splashing from the waste pipes which discharge into it, but I prefer to sink a channel below the floor level and to give the floor of the apartment a fall in this direction so that it may be readily swilled down. Splashing can easily be avoided if the waste pipes are connected to branches on the channel.

Where it is necessary to cover a floor channel the gratings should be of a very much more open pattern than is usually met with to allow the condition of the channel itself to be seen at a glance.

Baths.

A good deal of water, and hot water too, is wasted where baths with parallel sides are fitted instead of taper baths: the difference in capacity of two 5ft. 6ins. baths being about 6 gallons when holding water 9ins. in depth, and about 12 gallons when filled.

The recent improvements in enamelling iron lead me to hope that before long we shall be able to have all our sanitary appliances constructed of this material rather than of earthenware, the durability of which, especially when white enamelled, leaves much to be desired.

Steam Plant.

It is a practical necessity for a modern hospital of any size to be provided with steam boilers, if only for cooking purposes; but nowadays steam is largely used for heating buildings as well as for disinfecting and sterilizing, and where hospitals have their own wells or electric-lighting plant further uses are found for it.

Boilers.

There are three types of steam boilers which are well suited for hospital purposes. These are the Lancashire boiler, the marine type cylindrical boiler, and the water-tube boiler, and it will depend very largely upon circumstances which is the best to adopt. Where there is ample space and facilities for getting them into position, Lancashire boilers will be as suitable as any; where floor space has to be economized the marine type may with advantage be adopted; and where the position is awkward and cramped, and the boiler cannot well be put in in one piece, it may be advisable to adopt the water-tube form. Whichever type is adopted it is necessary to put in at least two boilers, so that whilst one is being cleaned out or repaired the other may be available for use.

In order that the boilers may work economically it is necessary to get as much heat out of the coal as is possible, and with this object not only is the direct heat of the burning fuel utilized, but the hot gases before they are carried into the chimney shaft are made to pass over as large a surface of the boiler as circumstances permit.

Economizers.

A certain amount of heat must be expended in creating a sufficient draught in the chimney to carry off the products of combustion, but unless special means are taken to prevent it a great deal more heat is carried off through the chimney than is necessary for this purpose and is wasted. It is therefore advisable to adopt a piece of apparatus which is known as an economizer. This consists of a number of pipes arranged vertically side by side in a brick chamber through which all the flue gases are made to pass as they escape to the chimney, and the feed water, in traversing the economizer pipes on its way to the boiler, is heated by these gases.

The exterior of the pipes is kept clean by means of scrapers which pass slowly and regularly up and down, and are worked mechanically either by a small steam engine or else by an electric motor.

Long before it becomes necessary to renew a boiler more or less deterioration takes place, and it is therefore well worth while to instal boilers in the first instance which are of greater strength than is actually required for immediate purposes. This will allow deterioration to go on for a much longer period than if the boilers when new are just suited to the steam pressure employed.

Condensed Steam and Incrustation.

The steam arrangements of a hospital should be so laid out that as far as possible every drop of condensed steam is returned to the boilers, and this for two reasons. In the first place it is extravagant to allow hot condensed steam to run away into the drains, because its place in the boilers will have to be taken with water which will have to be heated; and, secondly, condensed steam is the most suitable liquid with which to feed a boiler. This is particularly the case in London, where the water is hard and tends to form a deposit on the interior of the boiler. The deposit is a very bad conductor, and therefore even a thin scale seriously interferes with the transference of heat from the burning fuel and the hot flue gases to the water which is being boiled. In order to prevent this boiler incrustation a very good plan, and one very commonly adopted, is to pass all the feed water through a heater, which consists of a metal chamber in which is a coil or other arrangement of steam pipes. The steam in the pipes heats up the water in the chamber and causes it to deposit the bulk of those substances which constitute scale before it passes on to the boilers. Where a steam engine is employed the exhaust steam can be utilized for heating the feed water in this way. The feed water is usually returned to the boiler by means of a pump, but it is sometimes forgotten that a pump for hot water must have no suction pipe, that is to say, the pump must be placed below the level of the tank which contains the water which is to be forced into the boiler, or it will not work satisfactorily.

Not long ago I was being shown the general arrangement of the steam plant at one of the large London hospitals, and I found that the pipes which conveyed condensed steam were many of them carried outside the building, and that they were not covered with any non-conducting material to prevent any undue loss of heat. I enquired the reason and was informed that, even with these bare pipes, the condensed steam arrived at the feed pump at times so hot that it was necessary to add cold water, and this waste of heat and waste of coal was going on simply because the feed pumps were placed above the tank into which the condensed steam flowed.

Mechanical Stokers.

To ensure uniformity in stoking and to save labour, mechanical stokers are often fitted to boilers, but it is questionable how far their employment in hospitals is an advantage.

Electrical Plant.

Very few hospitals as yet have their own electrical plant, and the great majority therefore are compelled to take their current from a supply company.

So far as the lighting of a hospital by ordinary electric glow lamps is concerned, the alternating supply is as good as a continuous supply, but for motors the latter is more satisfactory.

Voltage of Lamps.

The legal unit of electricity in this country is known as the Board of Trade unit, and the number of units supplied to a consumer is registered by a meter with a dial similar to that of a gas meter, but it is most important to clearly grasp the fact that, whereas gas is charged for merely according to the volume that is used, a unit of electricity is based not only upon the quantity but also upon the pressure at which that quantity is supplied. With a pressure of 100 volts a 16 candle-power lamp takes twice as much current as a similar lamp at a pressure of 200 volts, and only half as much current as one at 50 volts. What is paid for is electrical *energy*, and to estimate this you must multiply the current by the pressure. The Board of Trade unit is 1,000 watts or 1⅓ horse-power in operation for one hour, and that energy is enough to keep a 16 candle-power lamp glowing for about 16 hours.

Systems of Charging for Current.

There are two general systems of charging for electricity—the flat rate system and the maximum demand rate system. A flat rate system is one under which the charge for all electricity used for lighting is uniform, and the charge for all electricity used for motors or for heating is also uniform.

Under the maximum demand rate system part of the electricity used for lighting is charged for at one rate, and the rest at a different rate, and the same distinction is made in the charge for electricity for motors and heating. In the latter case it is found that to a very great extent the current taken is distributed over a considerable number of hours, and therefore supply companies do what they can, by reducing their charges, to encourage the use of electricity for such purposes.

That the maximum demand system of charging is favourable to the companies is shown by the fact that it has been adopted by over 160 electrical supply undertakings in the United Kingdom. Whether the introduction of the system would be to the interest of hospitals I cannot say, but any hospital could fix an indicator * for itself and determine the question.

Wiring.

Now with regard to the wiring of a hospital. If current is obtained from a supply company it will be necessary to keep the mains for lighting and power purposes separate and distinct, with a meter upon each, if the benefit of the reduced rate for current for motors, fans, X-ray apparatus and so forth is to be obtained.

Although failures in the supply of electricity from a central station are not of frequent occurrence, it is an advantage where possible to take current regularly from two companies, or else to take the whole current from one company and to have what is known as a "stand-by" from a second. In either case, with a suitable arrangement of switches, should one supply fail there is the other to fall back upon at a moment's notice.

Main Branches.

In laying out the wiring system of a hospital care should be taken to protect all main branches from injury in the event of an outbreak of fire, for it must be remembered that the insulation of electric cables consists of inflammable material, such as india-rubber, which renders them much more liable to damage than gas pipes. They should, in my opinion, be carried in some form of conduit laid underground or built into solid brick walls.

Small Branch Circuits.

The small branch circuits may preferably be run in steel tubes with screwed joints, care being taken to keep the tubes amply large enough to allow the conductors to be drawn out and replaced, should this become necessary. With this precaution the tubes may with safety be buried in the walls. In the open air or in cellars the tubes should be lined internally with insulating material to prevent condensation of moisture, which when present invariably after a time destroys the covering of the wires. Conductors should be kept away as much as possible from pipes conveying water or steam, and this is more particularly necessary where the wiring is run in wood casing. Wood casing may by chemical treatment be rendered non-flammable.

The rapid extension of the use of electricity in one way or another for curative purposes makes it most desirable that in wiring a hospital a very large margin should be allowed in the sizes of the conductors. I am confident that where no provision except for lighting has been made it will in a few years become necessary to replace much of the wiring with conductors of larger size.

Ward Lighting.

For ward lighting the best plan, in my opinion, is to adopt single pendant lights down the centre, supplemented by brackets along the walls. The brackets may be placed one between every two beds, and may either be fixtures or else of a semi-portable type attached to the wall with a hook and provided with a flexible cord taking current from a wall-socket. Since, in any case, wall-sockets for hand-lamps are practically a necessity, the latter system is rather the cheaper to instal, but the number of flexible cords it involves is a decidedly weak feature, for they will not bear rough usage.

Lights over Operating Table.

It is a good plan to wire the lamps over the operating table of a theatre on two circuits, so that the melting of the safety-fuze on one of them will not extinguish all the lights. As a precaution, some second means of illumination should also be provided, or one day the failure of the light during a critical operation may result in the loss of a patient's life.

Checking Current Consumption.

The question of checking and controlling the consumption of current is an important but somewhat difficult one. I consider that a good deal may be done to effect economy by making each ward a unit and providing it with its own meter, and in this way fostering the natural spirit of emulation which exists between the various wards.

Switches.

Economy is, I am sure, promoted by th free use of two-way switches, which allo the lights in rooms or corridors which hav two doors to be extinguished at either o them. Another useful application of thi switch is that which allows either of tw lamps to be lighted but prevents their bot being in use at the same time.

In the ward bathrooms switches of th ordinary kind may be adopted, but in al other bathrooms and lavatories it is desirabl that the switch for turning on the ligh should be worked by the means of a bol fitted on the inside of the door, so that th light cannot be left on when the bathroom unoccupied.

Cellars which are ordinarily kept locke may be arranged with an automatic swit which puts on the light when the door opened and puts it out as soon as the door closed.

Finsen Light and X-Rays.

Passing on now from the subject of illum nation to that of medical applications electricity, such as the Finsen light ar X-rays, neither alternating current nor a hig

---

* Consisting of a gauge tube and a thermometer with a strip of foil fixed around the bulb and forming part of the electrical circuit.

ressure direct current is suitable, and it is ecessary to transform or rectify the former nd to reduce the voltage of the latter.

The requisite alteration of current can be erformed by an electric motor coupled to a ynamo. The motor is driven by the current urnished by the company and in turn drives he dynamo, which is so designed as to urnish direct current at the proper pressure.

Another way of reducing the pressure is y inserting a resistance in the circuit to issipate the surplus energy, but this is a asteful method and should not be adopted here much current is used. At one of the ondon hospitals I recently saw a single insen lamp worked in this way off a 200-olt circuit. The lamp was in regular peration, I understood, for eight or more ours a day, and it was taking about 13 mperes. The cost of running this lamp, ith electricity at 2d. per unit, if used six ays a week would be £54 per annum for urrent, and of this sum no less than £40 ould be wasted in the resistance and only 14 usefully employed in the lamp itself.

In this case great economy could be effected y using two lamps and passing the current rst through one and then through the other. this way the second lamp would take the lace of part of the resistance, and since no ore current would be wanted for the two mps than for one, and two lamps would nly have to be worked half the time of one, e electricity bill would be reduced, for insen work only, by £27 per annum. If the umber of lamps were increased to three the cost of electricity would be further reduced from £54 to £14.

Thermometers.

The only other use of electricity to which I have time to refer to is that of indicating and recording temperature by means of platinum thermometers. The thermometers may be distributed over the hospital and placed, for example—

(*a*) In the boiler-room to show the temperature and therefore the pressure of the steam, and the temperature of the feed water.

(*b*) In the chimney shaft to show the temperature of the flue gases.

(*c*) In the hot-water pipes.

(*d*) In the wards.

(*e*) In the air-ducts where the plenum system of ventilating is in use.

(*f*) In the refrigerators.

It is not necessary to be near the thermometer in order to read it. Wires are brought from the various thermometers to some convenient spot and connected to terminals on a board to which the indicator can be attached and read in a few seconds, or if desired the thermometers can be made to record their readings automatically on charts.

It may be that some day an instrument of this kind will be found in every hospital for accurately recording the variations in temperature of patients, and already it has been employed, I understand, by Major Ross for this purpose in his investigations of malarial fever.

Contracts Open.

NEW GRAMMAR SCHOOL AT FARNHAM, SURREY.
TO BUILDERS.

The Governors of the Farnham Grammar School are prepared to receive TENDERS for the erection of a new Grammar School at Farnham. Drawings, Specification, and a copy of the Conditions of Contract may be seen on application to the Architects, Messrs. Jarvis and Richards, 56, Victoria Street, Westminster, S.W., and Bills of Quantities and Form of Tender may be obtained from them on and after the 23rd JANUARY, 1905, on payment of Two Guineas; the sum so expended will be returned to those persons who send in Tenders in conformity with the conditions specified below.

The Governors do not bind themselves to accept the lowest or any Tender.

TENDERS must be delivered before 12 o'clock noon on the 7th FEBRUARY 1905, addressed to the Clerk to the Governors of the Farnham Grammar School, E. Kempson, Esq., 121, West Street, Farnham, and endorsed "Tender for New Grammar School, Farnham."

E. KEMPSON,
Clerk to the Governors.

BECKENHAM URBAN DISTRICT COUNCIL.
TO CONTRACTORS.

The Beckenham Urban District Council invite TENDERS for the SURFACE DRAINAGE of Kingswood and Mays Hill Roads, Shortlands.

The works consist of the laying of about 4,000 lineal ft. of 9 in. pipes, 250 lineal ft. 12 in. pipes, together with the construction of about 20 manholes and the fixing of 70 stoneware gullies.

Plans and sections may be seen and bills of quantities, specifications, and forms of Tenders obtained on application to Mr. JOHN A. ANGELL, Surveyor, on and after JANUARY 20th, on deposit of £1 (cheques not accepted), which will be returned on receipt of a bonâ-fide Tender.

A clause will be inserted in the Contract providing that the contractor shall pay to the workmen employed in the execution of the work the wages generally accepted as current for workmen engaged on similar work in the district.

Payment under the Contract will not be made until six months after the completion of the works.

Tenders, duly sealed and endorsed "Tender for Drainage Works," to reach undersigned not later than FOUR p.m., MONDAY, FEBRUARY 6th, 1905.

The Council do not bind themselves to accept the lowest or any Tender.

By order,
F. STEVENS,
18th January, 1905. Clerk to the Council.

Miscellaneous.

NOTICE TO OUR SUBSCRIBERS.

THE INDEX OF "THE BUILDERS' JOURNAL."

The Title Pages and Index to any volume of "THE BUILDERS' JOURNAL" may be had free, upon application being made to the Office, Great New Street, enclosing 1d. stamp to cover postage of same.

VOLUMES I. to XIX. of
THE BUILDERS' JOURNAL.
Handsomely bound in cloth gilt, 7/- each.
Binding Cases for any of the above Volumes can now be obtained, price **1/9** each.

Privileges open to all Regular Readers of the "Builders' Journal."

I.—Free Monthly Advertisements.

1. A Free Advertisement of 12 words in the Wanted or Miscellaneous Advertisement Columns, in one issue of the BUILDERS' JOURNAL during each calendar month will be given to any regular reader.

2. The charge of one penny will be made for each additional word.

3. Advertiser's Name and Address or Box Number must be counted, but will in no case be reckoned as more than five words.

4. All advertisements must be accompanied by the correct remittance, and should a receipt be required a stamped addressed envelope must be enclosed.

5. The Proprietors reserve to themselves the right of refusing any advertisement.

II.—Free Answers to Enquiries.

1. The services of a large staff of experts are at the disposal of all regular readers who require information on architectural, constructional or legal matters.

2. Questions should in all cases be addressed to the Editor, and be written on one side of the paper only.

3. Correspondents are particularly requested to be as brief as possible.

4. The querist's name and address must always be given, not necessarily for publication.

Note.—Owing to the large number of enquiries we receive weekly, we are compelled to restrict the advantages of this department to Regular Readers.

III.—Free Accident Insurance of £500.

1. Every regular reader of the BUILDERS' JOURNAL is entitled to the benefit of this Insurance.

2. A Pamphlet giving full details of this and other Insurance schemes inaugurated by the BUILDERS' JOURNAL for the benefit of its readers, and guaranteed by "The Ocean Accident Corporation, Limited," will be sent on application.

What is a Regular Reader?

We have employed the term "Regular Reader" throughout these announcements as the description "subscriber" is often understood to mean one who subscribes direct to the publishing office.

We mean by a Regular Reader anyone who has placed an order with us or any newsagent or bookstall for the BUILDERS' JOURNAL for one year.

Those readers who order the BUILDERS' JOURNAL through their local newsagent or bookstall should send us the newsagent's receipt. Their names will then be placed on our subscribers' list, and they will be entitled to all the advantages set out above.

5 O'CLOCK P.M. MONDAY IS THE LATEST TIME FOR RECEIVING "WANT" ADVERTISEMENTS.
OFFICE: 6, GREAT NEW STREET, FETTER LANE, E.C.

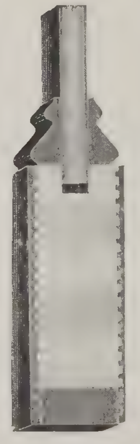
THE GILMOUR DOOR·Co

Factories
Trenton
Canada

53 BERNERS STREET
LONDON



All the material used in the Framing of these Doors is put together as shown here.

The Interior "Core" is made in strips of selected pine with the grain reversed, and dried with 200 degrees of heat.

The Exterior Hardwood Facing is welded to the Core by means of immense pressure, making in effect one solid piece.

HARDWOOD
In Various Designs

From 35/- to £10.
DOORS

RICHLY CARVED DOORS carefully reproduced from old models can be made in any hardwood, possessing all the elegance and richness of figure and colour found in the antique examples.

ARCHITECTS are invited to inspect the specimen doors on exhibition to satisfy themselves as to the construction, quality and artistic merit. Sample doors can be seen at the Showrooms of the various agents, or at 53, Berners Street, London, W.

A GUARANTEE. The Gilmour Door Co., Ltd., will give a guarantee with all their doors that they will not warp, twist, split, shrink or crack. They are absolutely reliable.

COST. A well-made Hardwood Door can be obtained at prices varying from 35s. to £10.

CATALOGUE. A book of designs, prices, &c., will be sent on application to "Dept. B," 53, Berners Street, London.

lectrical Notes.

Automatic Electric Lifts.

ıe electric lift lends itself to operations unattainable by other means of driving, most important being the dispensing an attendant by the use of the auto-c push-button system. Messrs. Archibald ch & Stevens have two systems of this described in their new pamphlet. In the uble-push-button" system there are two ı-buttons in the cage and two on each , one for ascending and one for de-ding in each pair. The button has to be sed till the cage reaches the destination ired, when it immediately stops on ase. The gates can be made to open only n the cage is at the correct level, and cage will not move whilst any gate is ı. Two persons cannot control the lift ultaneously. A possible disadvantage to system is that the speed is somewhat v, but this is overcome with the more plicated "single-push-button" system. cage is fitted with a button for each floor, whilst another is placed on each floor. On pressing the button at any gate the lift is brought to that point and the gate automatically unlocked. The lift will not start again until the gate has been closed, and when one of the buttons in the cage has been pressed the door is automatically locked and the cage starts up or down to the desired floor, where it unlocks the door again. The passenger must on alighting close the door behind him, when the lift is ready to work again for someone else. Means are also taken to prevent more than one person obtaining control. It is not perhaps generally known how much cheaper is the use of an electric lift over that of an hydraulic lift for equal duty.

Electrical Driving of Cotton Mills.

This subject is beginning to receive a very large amount of attention in Great Britain, partly no doubt due to the necessity for introducing economies owing to the operations of cotton financiers, and partly owing to the fact that recent improvements in motors and generating plants have made what was once a doubtful improvement now one of established fact. Recently also electricity has been introduced into many American cotton mills, and papers have been read on the other side of the Atlantic in which highly useful results have been tabulated as regards the undoubted economies. Another advantage is the possibility of using turbo-generators, which take up a very small space as compared with the old-fashioned Corliss engine, whilst the long line of shafts and belting are entirely dispensed with in favour of direct coupling of the motors to the looms, &c. Further, when three-phase current motors are used, these give results as regards constant speed quite unattainable hitherto; but also, by reason of the extreme simplicity of their parts and the absence of brushes and commutators, are much cheaper to handle and easier to maintain. A paper on the subject was recently read before the Manchester section of the Institution of Electrical Engineers by Mr. H. W. Wilson, who gave some interesting data regarding power costs. In a well-arranged electrically-driven mill the cost of producing energy, after allowing 5 per cent. interest and 10 per cent. depreciation, is about ·3d. to ·35d. per unit, giving a result of about £2 14s. per electrical horse-power-year. These figures should, however, be capable of improvement if the mills were to take power from a large central power station, and although they would only be running during the daytime the cost of generating would be considerably reduced if by the offer of special terms other manufacturers could be induced to take energy during the dark hours.

Electrical Power in the Post Office.

It is perhaps not generally known that the Post Office and Telegraph Departments at St. Martin's-le-Grand use a large amount of electrical power for lighting, for pneumatic tubes and for charging batteries. The ordinary Daniell cells which formerly provided the current for telegraphic purposes, and of which thousands were in use, have been largely superseded by accumulators, but the plant at the Post Office is not large enough to cope with the demands for this purpose, for the large extensions of lighting, and for the extra power required to provide the compressed air for the pneumatic tubes. These last have effected large economies in the transmission in the metropolis of quantities of telegrams at a time, and although there are about 42 miles of pneumatic tubes radiating to distances of 2 to 2½ miles this is not enough and it is proposed to lay down about another 20 miles of tube when more power is available. This will be provided by a new central power station, to be built on the Surrey side of the Thames opposite the Temple, where three-phase plant of a capacity of 2,000 kilowatts will be installed. It is expected that this plant will be working in the summer of next year.

BUILDERS' JOURNAL EMPLOYMENT REGISTER.

FOR 3/- WE ADVERTISE YOU FOR SIX WEEKS.

This register is compiled to bring together Employer and Employed, to their mutual advantage.

In the building trades when a rush of work comes an employer suddenly finds himself in urgent need of employees. Our scheme designed to assist him and employees by sustaining these advertisements for six weeks.

For 3/- we give three insertions (four lines) in our "Appointments Wanted" column (*see* page xvi), and also six insertions belo

Instructions.—Advertisers must furnish their names and full addresses, a number being assigned to each for identification. communications will be treated in the strictest confidence. Abbreviations employed :—s., salary ; ex., experience ; refs., references ; yrs., yea

ARCHITECTS' ASSISTANTS.

386.—ARCHITECT, with own office, can assist with perspectives, designs, working drawings and quantities.

843.—ARCHITECT'S ASSISTANT, good draughtsman, fully qualified, artistic, sal. 30s., ex. refs.

846.—JUNIOR ASSISTANT (24). Tracing, inking in and colouring, 5 yrs City exp. West London pref.

847.—ARCHITECT'S ASSISTANT, A.R.I.B.A. Wide exp. in provincial work. Design, details, quantities. ex. refs., mod. s.

848.—ARCHITECT'S ASSISTANT, surveys, levelling, details, quantities. Honours Building Construction. Clerk of Works, sal. 25s.

851.—ARCHITECT'S JUNIOR ASSISTANT, measuring up, plotting, and knowledge of construction.

860.—ARCHITECT'S JUNIOR ASSISTANT, 3½ yrs. exp. in London, mod. s.

862.—YOUNG ARCHITECT, M.S.A., ex. qualifications and refs. Varied exp., design specifications, quantities and surveying.

863.—ARCHITECT'S ASSISTANT, 9 yrs. varied exp., contract and detail drawings, perspectives. Ex. refs., mod. s.

865.—ARCHITECT'S JUNIOR ASSISTANT, age 23, wants London appt., 4½ years' exp. Good refs., mod. s.

868.—ARCHITECT'S ASSISTANT (23), 7 yrs. exp. Design, details, surveying, levelling, good refs.

870.—ARCHITECT AND SURVEYOR'S ASSISTANT, good surveyor and draughtsman, all-round exp., mod. s.

872.—ARCHITECT'S ASSISTANT, 9 yrs. London exp. Drawings, details, perspectives, specifications, domestic and Renaissance work, mod. s. good refs

877.—ASSISTANCE rendered with competition, detail and working drawings. Competent man. Honours Building Construction, Prizeman S. Th.

878.—ARCHITECT & SURVEYOR'S ASSISTANT. London or district, 12 yrs. varied exp.,

879.—ARCHITECT'S JUNIOR ASSISTANT, neat draughtsman. Tracer and colourist.

881.—ASSISTANCE rendered in taking off quantities. Also variations, specifications and accounts. 12 yrs. exp. London. Mod. terms.

883.—ARCHITECT'S ASSISTANT (25), 9 yrs. exp. in Midlands and Wales 1 year with C.C. Designer ; good refs.

884.—ARCHITECT AND SURVEYOR'S 1ST CLASS ASSISTANT undertakes work by day or week.

886.—ARCHITECT AND SURVEYOR'S ASSISTANT. A.R.San.Inst., 9 yrs. exp. Contract drawings, details, specifications, surveying and levelling.

888.—ARCHITECT'S ASSISTANT (24). Good exp. an refs. Design, working drawings, details and perspectives, quantities, specifications, &c.

889.—ARCHITECT'S ASSISTANT, 14 yrs. good exp. in large London office, good refs. Sal. £2 15s.

CARPENTERS AND JOINERS.

839.—STAIRCASE HAND AND HANDRAILER. Plans and specification work. Go setter out.

CLERK OF WORKS.

866.—CLERK OF WORKS. Good refs., shortly disengaged.

CLERKS.

861.—BUILDER'S CLERK wants two days per week, abstracting, p.c., a jobbing acs.

869.—BUILDER'S CLERK AND DRAUGHTSMAN (23), wkg. and detail drawin tracings, quantities, estimating. contract and jobbing.

873.—BUILDER'S ESTIMATOR and Measuring-up Clerk (37), good busin abilities and sound knowledge of trade.

882.—BUILDER AND CONTRACTOR'S CLERK. P.C. accounts, book-keepi drawing, and quantities and estimating, ex. refs.

887.—BUILDER'S CLERK AND ASSISTANT. Life exp. jobbing work. Estimat decorating and sanitary work, good refs., mod. s. Could manage.

DESIGNERS, TRACINGS, &c.

844.—EXPERIENCED DRAUGHTSMAN renders assistance in evening with w drawings, details, &c. Terms mod.

849.—PERSPECTIVES, ink, wash or colour, and assistance with designs a competition work.

FOREMEN.

834.—SUPERVISOR for dept. in Modelled Fibrous Plaster Ceiling or Carton Pier establishment.

880.—GENERAL FOREMAN, 35, good manager and organiser, used to West E Experienced. Trade, joiner ; abstainer.

MISCELLANEOUS.

867.—MONUMENTAL LETTER CUTTER, age 39, carver and mason, long ex drawing and modelling.

871.—WATCHMAN OR CARETAKER, 18 yrs. refs., married, would pay security permanency.

885.—STONE TURNING by exp. man, day or piecework. Balusters and finial speciality.

QUANTITY SURVEYORS.

845.—QUANTITY SURVEYOR'S ASSISTANT, ex. refs.

T. Bagnall & Sons, builders, Langley and Oldbury. First meeting, 191, Corporation Street, Birmingham, Jan. 20th, at 11. P.E., West Bromwich Law Courts, Jan. 23rd, at 10.30.

Woolpit Brick Co., Ltd. A winding-up order has recently been made against this company. Loss on trading since formation of company in 1899, £31,000. Liabilities £39,830 (£18,059 unsecured); no available assets after satisfying the debentures; deficiency £68,047.

Coming Events.

Wednesday, January 18.

Royal Philosophical Society of Glasgow (Joint Meeting with the Glasgow Architectural Association).—Prof. Eugene Bourbon, B.A., A.D.F.G., on "The Education of the Architect," at 8 p.m.

Edinburgh Architectural Association.—Mr. Mathew Buchan on "The Electric Lighting of a Country House," at 8 p.m.

Chemical Society.—Meeting at 5.30 p.m.

Institution of Civil Engineers.—Students' visit to Young & Co.'s Ironworks, Nine Elms Lane, S.W., at 3 p.m.

British Archæological Association.—Meeting at 32, Sackville Street, W., at 8 p.m.

Builders' Foremen and Clerks of Works' Institution.—Annual Meeting at 8 p.m.

Thursday, January 19.

Society of Architects.—Mr. T. R. Croger on "Some Historic Buildings in the City of London." Staple Inn Buildings (South), Holborn, at 8 p.m.

Society of Antiquaries.—Meeting at Burlington House at 8.30 p.m.

Camera Club.—Dr. J. A. Ewing on "The Structure of Metals," Charing Cross Road, at 8.15 p.m.

Friday, January 20.

Institution of Mechanical Engineers.—Four papers on "American Workshops and Machinery," at 8 p.m.

Architectural Association (Old Day Students' Club).—Fourth Annual Dinner, Florence Restaurant, Rupert Street, W., at 7.30 p.m. (Chair, Sir Aston Webb, R.A.)

Monday, January 23.

Surveyors' Institution (Junior Meeting).—Mr. C. H. Dinwiddy on "Rating and Possible Legislation," at 7 p.m.

Royal Institute of British Architects.—Mr. James Ransome, F.R.I.B.A., on "European Architecture in India," at 8 p.m. Award of Prizes and Studentships.

Royal Geographical Society.—Mr. Richard N. Hall on "The Great Zimbabwe and Other Ancient Ruins in Rhodesia," the Theatre, Burlington Gardens, at 8.30 p.m.

London Institution.—Mr. Hugh Stannus on "Architecture from Egypt to Rome," at 5 p.m.

Tuesday, January 24.

Northern Architectural Association (Students' Evening).—Mr. W. E. Bland, M.I.S.E., on "External Plumbing," at 7.30 p.m.

Wednesday, January 25.

Society of Arts.—The Hon. Robert P. Porter on "London Electric Railways," at 8 p.m.

Edinburgh Architectural Association.—Prof. G. Baldwin Brown on "Old Edinburgh," at 8 p.m.

Thursday, January 26.

Leeds and Yorkshire Architectural Society.—Mr. Thomas H. Mawson, Hon. A.R.I.B.A., on "Garden Design," at 6.30 p.m.

Society of Antiquaries.—Meeting at Burlington House at 8.30 p.m.

Friday, January 27.

Glasgow Technical College Architectural Craftsmen's Society.—Discussion on "Ventilation," at 8 p.m. (Mr. Isaac Low for "Natural," Mr. J. Lochhead for "Mechanical.")

Architectural Association.—Messrs. J. B. Fulton and E. F. Reynolds on "Byzantine Architecture," at 7.30 p.m.

University College.—Mr. D. S. MacColl on "English Art from Constable to the Present Time," "Historical" and "Genre" painting, Etty, Wilkie, and other Painters, at 4.30 p.m.

Saturday, January 28.

North of England Institute of Mining and Mechanical Engineers.—Council Meeting at 1.30 p.m.

New Companies.

Eskmeals Granite Co., Ltd., 42, Lowther Street, Whitehaven, Cumberland. Capital: £10,000.

MONTHLY
FIRE SUPPLEMENT
TO THE
BUILDERS' JOURNAL AND ARCHITECTURAL RECORD.

Edwin O. Sachs, F.R.S.Ed., Architect,
Consulting Editor.

Number 3.
January, 1905.

SUMMARY.

The ultimate value of all fire-resisting buildings is that of their weakest part, and it is in this respect that the new Entrepôt Royal (or Government Bonded Stores) at Antwerp is defective. Though most admirably designed and executed as a whole, with façades and dividing walls in brick, and ceilings, columns and terraces of reinforced concrete, there appears to be an insufficient covering of concrete over the metal rods, the doors to the lift wells do not close properly, and openings of about 9ins. diameter have been left in the floors and walls. (Page 38.)

A report on the first independent test of a sprinkler, after having passed through the usual Fire Office test, is given on p. 46.

Loud-sounding gongs are now adopted by the London Fire Brigade instead of the old method of shouting. (Page 47.)

A special "dangerous structure" trap is used in Munich, fitted with crowbars, spades, jacks and numerous other appliances. (Page 48.)

The "fire watches" in the Berlin theatres are undertaken by the Royal Police Fire Brigade, who drill daily, employing a number of "dummies." (Page 45.)

The fire-curtain at the Crouch End Opera House, which was destroyed on Christmas Eve, was not, apparently, of asbestos cloth, but of two thicknesses of canvas painted with asbestos paint. (Page 45.)

A fire testing station at Columbia University has been organized. (Page 46.)

Tests with electro-glazed casements, a concrete floor and an automatic fire-alarm system are to be conducted by the British Fire Prevention Committee to-day. (Page 46.)

The International Fire Service Council constituted in 1900 with the primary objects of serving as an enquiry office as a centre for the issue of statistical reports of international importance, and systematizing the International Fire Congress arrangements, is gradually becoming a very representative institution. Great Britain has twelve representatives on the Council. (Page 42.)

In America there are excellent provisions to ensure safety from fire, but these are wilfully ignored, and hence such disasters occur as at the Iroquois Theatre, Chicago. (Page 44).

The Granolithic floors at Cranston's Hotel, Southampton Row, London, broke the force of the gas explosion which occurred recently in the basement of a shop under the hotel and resisted the fire which succeeded, and saved the hotel from serious damage. (Page 42.)

THE HORNE BUILDING FIRE AT PITTSBURG.

AT a time when questions of fire-resisting construction are being considered from every possible aspect, there can be no more valuable data presented than that which refers to actual fires. It is practically immaterial what the date of the fire may be, as long as it has been carefully reported upon and well illustrated by photography.

It is for this reason that we are in this number reproducing some excellent illustrations and some useful technical particulars regarding the great Horne building fire of some years ago, which served as such an interesting example, but which was scarcely sufficiently studied at the time owing to the problem of fire-resisting construction not having been given that attention in this country at that period which it now enjoys.

Directly after this fire at the Horne building in Pittsburg, U.S.A., the insurance companies interested instructed their representatives to make a careful investigation on the spot, and to report as far as possible the actual facts and also present their opinions in the form of notes. A committee was constituted and the report prepared, and it is this report which we have before us.

The report was presented *in extenso* with many diagrams and numerous tables as far back as 1898.

It would indeed be well if such excellent reports were obtainable in respect to fires in the British Isles as were prepared as far back as 1898 by insurance men in Pittsburg, and have since then been also prepared by insurance offices in respect to such conflagrations as the Baltimore and Rochester fires of the United States.

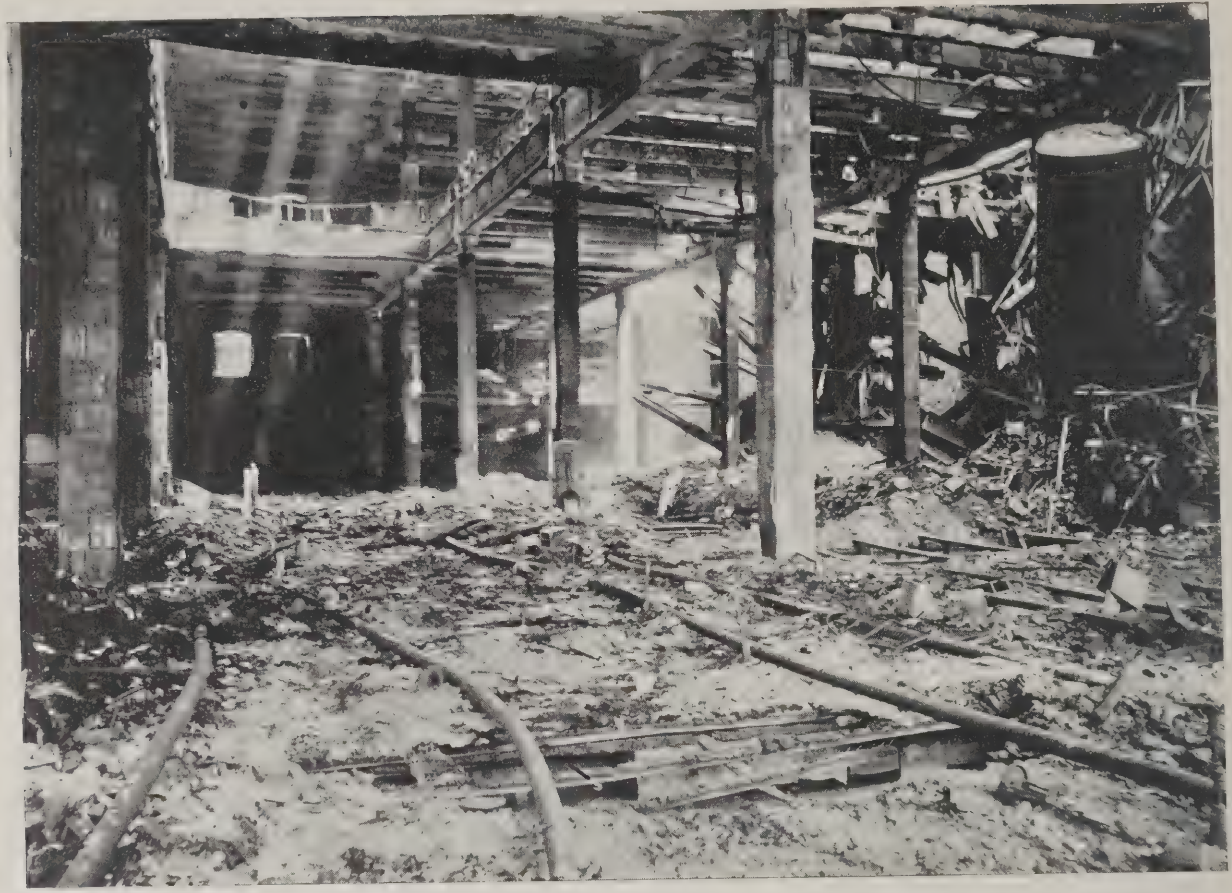
The Fire.

A map of the burned district is shown on p. 34. For a graphic account of the fire we quote from the "Engineering World" of U.S.A. as follows:—

"According to the best available information, the night watchman for T. C. Jenkins's grocery store first became aware of fire while making his rounds at 11.45 p.m., but it was some little time before he finally located it in a barrel of paper, rags, scraps from the employees' dinner baskets and similar refuse which stood at the bottom of the elevated shaft. For some time—about fifteen minutes as estimated by the watchman—he fought the fire with a chemical fire extinguisher. Finding his efforts to be to little purpose and the flames rapidly ascending the elevator shaft, the watchman sent in a call for the fire department. The engines responded promptly, but so great had been the previous delay that the time of their arrival was 12.20 a.m. Ten minutes later the flames burst through the windows of the building, and at 12.45 o'clock every floor was burning fiercely, the flames apparently being fed by the large stores of oil, sugar, molasses, hams, &c., with which the building was filled. The firemen had for some time previous abandoned the hope of saving the Jenkins building, and had turned their streams upon the large dry goods store of Joseph Horne & Co. and the neighbouring office building, also belonging to Joseph Horne & Co. Despite their efforts, however, the woodwork of both these buildings near the tops began to burn at about 1 o'clock, and a few minutes later the flames from the Jenkins building had leaped the street and set fire to the inflammable contents of the dry-goods store windows. At almost the same time the office building began to burn. From this time on the spread of the fire was rapid, and a few minutes, according to reports, were sufficient for both the office and the store buildings to become a mass of flames so fierce as to drive the firemen from Penn Avenue and Fifth Street to the roofs of the buildings surrounding the fire. From these points of vantage at the rear of the Horne buildings on the far side of Fifth Street, and from the windows of the Methodist Book building, the firemen directed their streams and prevented the flames from crossing Fifth Street or reaching the rear of the Horne buildings, but the narrower Cecil Avenue was passed. The new Phipps office building was badly scorched, and the Methodist Book building above the fourth floor was completely gutted of its contents. In approximately two hours from the time of its first discovery, therefore, the fire had destroyed the three larger buildings of the group shown on the site plan, a half dozen smaller structures, and had damaged severely a number of other structures adjacent to the centre of the conflagration."

The Building.

The Horne Store building was a building 177ft. long and 118ft. wide centre to centre of columns. The building was of modern steel construction, all walls being carried upon the extended cap plates of the columns. To the sides of the girders were attached shelf angles. Upon these the floor beams were supported and were riveted thereto by two $\frac{3}{4}$in. rivets. The floor beams were generally about 5ft. apart centre to centre, and consisted of single 15in. 50lb. I beams. The sixth storey columns were connected longitudinally by means of 20in. 64lb. I beams. To the top of these were riveted the roof beams, consisting of 10in. 25lb. I beams, spaced 5ft. apart. Upon the roof beams were laid 5in. 3·7lb. T's, spaced 18ins. apart, and upon which were laid book tile to form the roof. From the roof beams the ceiling was suspended by means of $\frac{3}{8}$in. rods. These rods were 12ins. apart, transversely, and carried at their lower ends $1\frac{1}{2}$in. 2·5lb. T's. The length of the rods in the front of the building was 9ft. and in the rear of the building 3ft., thus forming a horizontal ceiling. Upon the ceiling tees were also



INTERIOR VIEW OF THE HORNE BUILDING AFTER THE FIRE.

laid book tiles. There was no protection given to the bottom side of the ceiling tees other than the plaster.

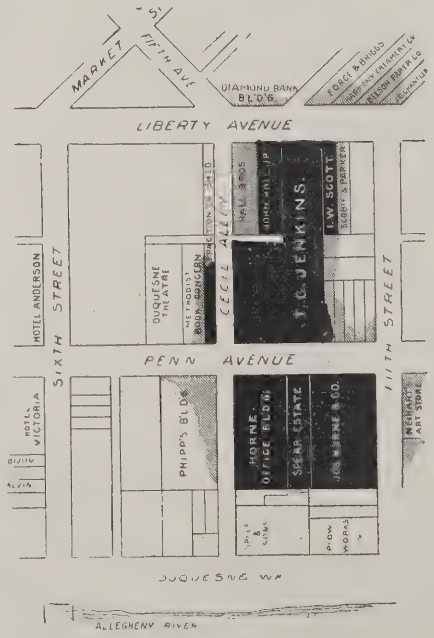
All the steelwork was covered by hard clay tile (terra-cotta), as shown in our illustrations. The floors were constructed of hard clay tile arches (terra-cotta) and were of the side construction type. The bottom of the beams and girders were protected by terra-cotta, which was attached to the same by means of sheet-iron strips, and for which there was no protection except that given by the plaster. The column protection consisted of hollow hard clay tile, which was put on in a manner much better than usual.

Effects of the Fire.

The general effect of the fire on the building is clearly shown on the accompanying photographs, which were kindly furnished to the British Fire Prevention Committee by the "Insurance World" of U.S.A.

The wreck of the eastern side of the building was caused by the falling of the water tank, weighing when filled 26 tons. This was supported by I beams, the dimensions of which could not be ascertained. Judging from the warped and weak condition of the remaining ceiling tees in the western part of the building, a fair surmise would be that the ceiling underneath the tank, which was located right outside the elevator shaft, gave way under the heat, which there was, no doubt, fiercer than at any other place in the building. The fall of the ceiling exposed to the action of the heat the unprotected columns of the sixth storey between the ceiling and the roof, and also the roof beams and those supporting the tank. These no doubt yielded on account of their loads and the action of the heat, and thus permitted the heavy tank to fall. The tank in falling carried with it to the first floor such columns and beams with which it came in contact, and which in turn dismantled a number of beams and girders to which they were connected.

Walls.—The east and west walls were examined to determine the amount that they were out of plumb by means of a fine transit instrument in perfect adjustment. South-west corner: From the ground floor to second floor the corner was plumb. From the second floor to fifth floor it leant towards Fifth Street, or westward, 2ins. The wall was perfectly plumb in the other direction, *i.e.*, it did not lean towards or from Penn Avenue. North-west corner: From the ground floor to second floor the corner leant northward 1½ins. From the second floor to the fifth floor the building was plumb. East wall: The upper portion of this wall bulged badly, and some part of it was gone; other parts of the wall appeared plumb



SITE PLAN.

Columns.—Each column in the building was first examined with the transit instrument, and then the results of this examination were verified by plummet observations, together with a close visual scrutiny. These results were then tabulated, but the presentation of these figures would lead too far. A general statement of these observations would be that the whole tiers were from 1in. to 2ins. out of plumb, and that the intermediate columns were on different sides of the plumb line. Tiers of columns, therefore, were in a sinuous condition, but the greatest deflection at any point in the whole tier would not be more than 2ins.

Girders and beams.—The girders and beams were also subjected to close scrutiny and a careful record made and tabulated. Every rivet on the building that was exposed was tapped, and not one loose rivet was found. All connections were also examined, and were all found to be in good condition as far as could be determined, with few exceptions.

Steel.—To determine to what extent the steel had been injured by the fire and what beams could be safely straightened, three very badly twisted beams were selected and test pieces were cut out as close to the bend as possible. The results of the tests were that, regardless of how badly bent the sections were, the material was in no case injured.

Technical Notes by the Special Committe of Insurance Experts.

The following notes were issued by the Special Committee of Insurance Experts:—

1st. "In buildings of about this height the distortion of the steel framework due to the heat of the fire cannot in any instance be sufficient to work any serious damage; nor is it probable that at any time would connection rivets be sheared off. This conclusion is arrived at for the reason that there is no probability that any future fire will be fiercer than the one at issue."

2nd. "The method of fastening 'fireproofing' to the underside of beams with sheet iron strips should be discarded."

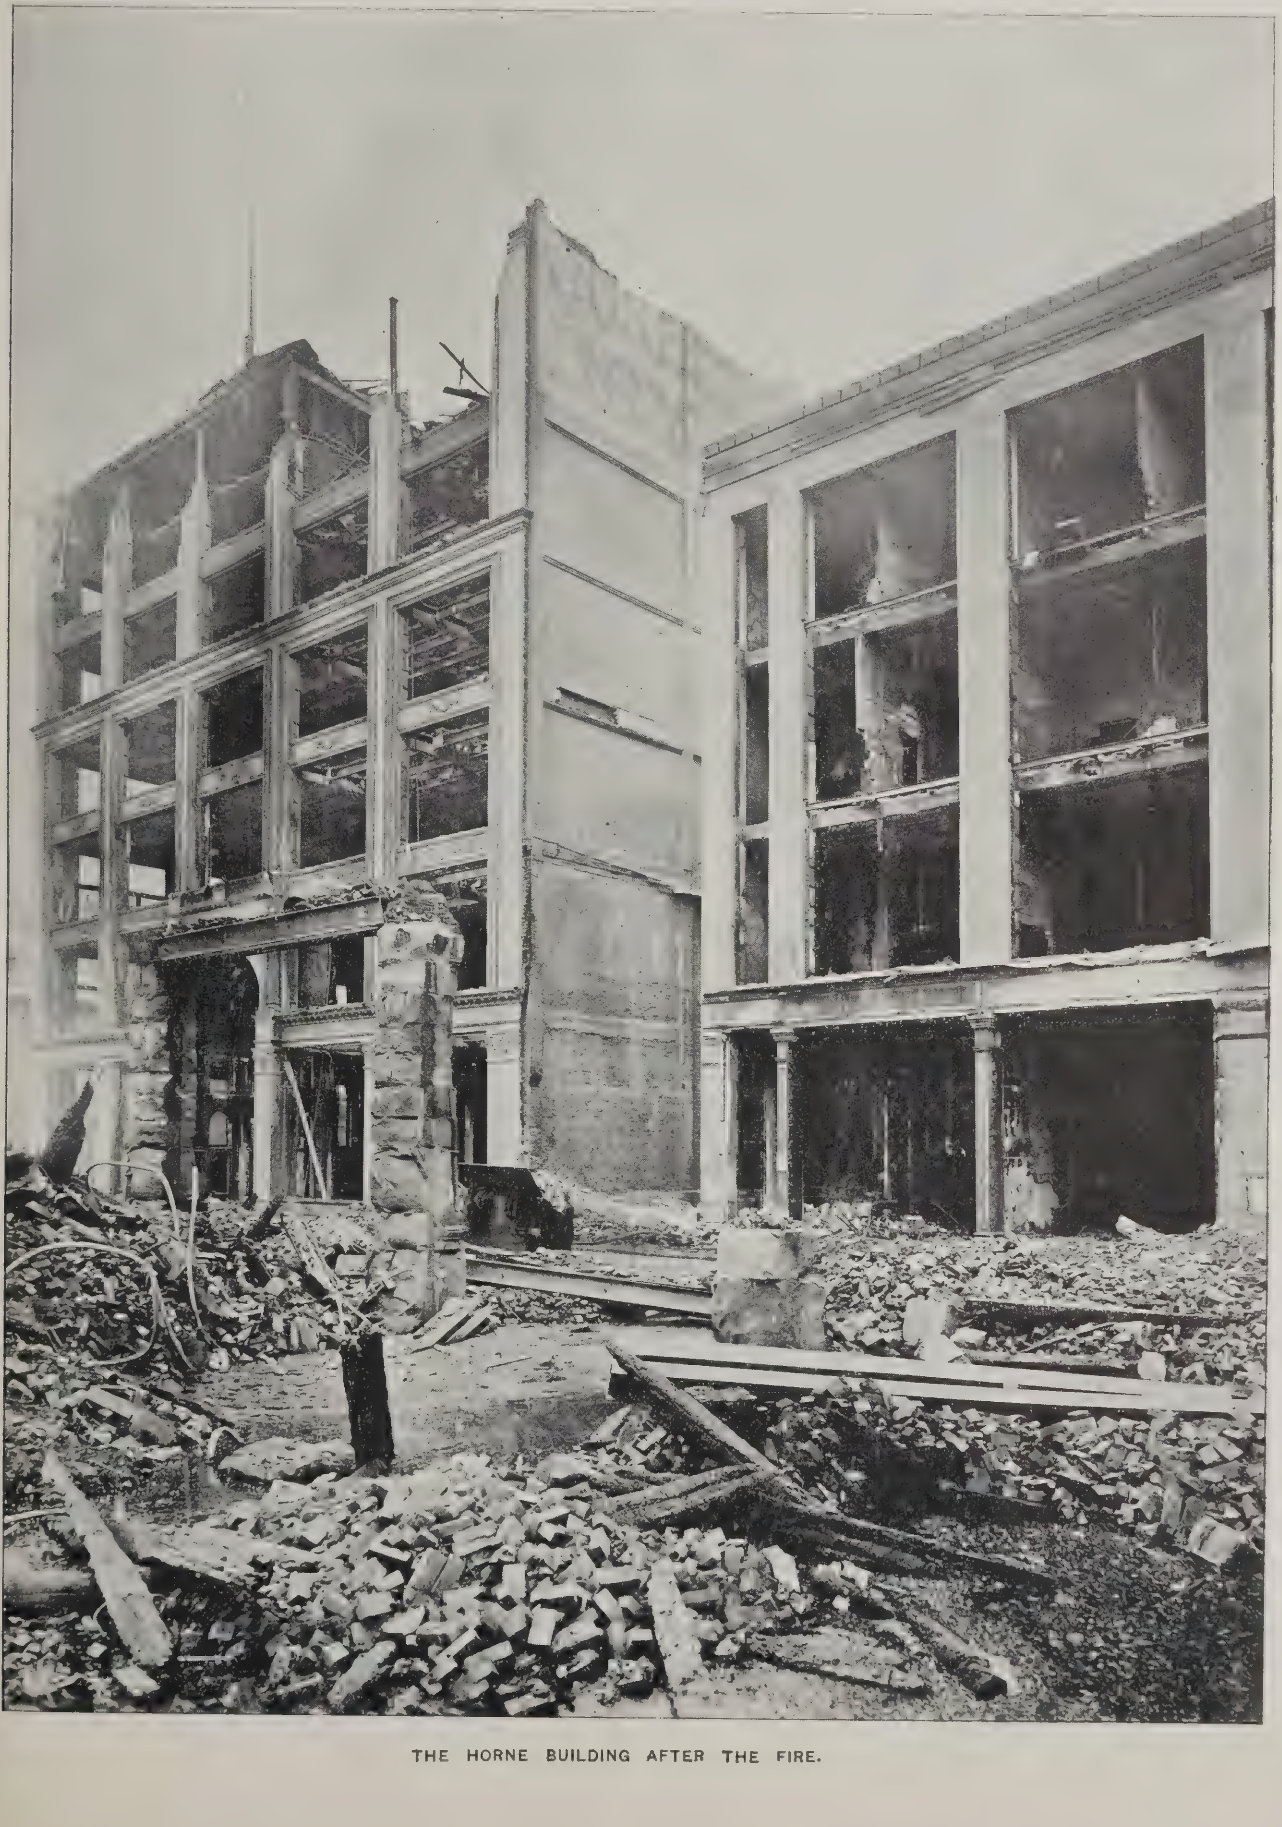
3rd. "It cannot be too often reiterated that open front buildings like this should be protected from external fires by metal shutters, and also that all shafts should be provided with metal doors which can be readily closed at all floors."

4th. "The most important lesson taught by this fire was the lack of strength developed by the fire-clay fireproofing (terra-cotta). The building was permitted to move in any direction without any material restrictions by the fireproofing. The floor arches showed by the scaling off of the lower webs that they were unable to offer any sufficient force to counteract the tendency to lateral motion."

5th. "The column protection, although composed of the very best obtainable kind of fire-clay tile, was also not of sufficient strength."

Further, the committee go on to say that:

"In our opinion it would have been necessary to dismantle the whole steel framework had this structure been fourteen or fifteen storeys high. The leaning at that height at the same proportion as developed would have entailed the necessity of taking the whole structure down. Owing to the fact that steel columns or girders or beams after being subjected to a long-continued fire will assume the same temperature as fireproofing, and owing to the fact, furthermore, that the rate of expansion of the steel is much greater than

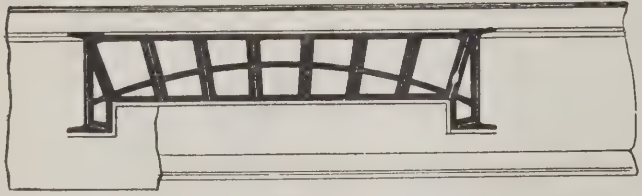


THE HORNE BUILDING AFTER THE FIRE.

that of the fire-clay tile, destructive movements are permitted which, as shown in this experience, will result in considerable damage, and which damage will increase in direct proportion to the height of the building.

"In view of these important developments, it is our opinion that important structures of this class should have a radically different method of fireproofing. The fireproofing should be in itself strong and able to resist severe shocks, and should, if possible, be able to prevent the expansion of the steelwork. There seems to be but one material which is known that could be utilized to accomplish these results, and that is first-class concrete. The fire-resisting qualities of properly-made concrete has been amply proven to be equal to, if not better than, fire-clay tile, as shown by the series of tests carried on by the building department of the city of New York.

"From the experience gained in street railway construction in laying continuous rails, it is to a large degree possible to prevent the metal from expanding. In street railway work this has been accomplished merely by the adhesion of the pavement to the side of the rails. In building construction the same results could be obtained by encasing the columns and girders with concrete placed directly against the steelwork. The adhesion of the concrete would to a large degree prevent unequal expansion of the concrete and steel. The floor arches should also be constructed of concrete, but of sufficient depth to be able to resist lateral forces. With the prevention of injurious expansion and the protection of columns with materials that can stand severe shocks of any nature whatever, the modern steel-frame constructed building would be more thoroughly protected against any fire. The construction herein suggested should not materially increase the cost of construction. The solid concrete about the columns would add strength to same, and could no doubt be made self-supporting. The same could be said of concrete surrounding beams and girders, as has been amply demonstrated by the strength developed by concrete iron constructions such as the Monier and Melan arches. One of the objections that would be raised against this construction would be that it could not be carried on in freezing weather. This is a proper objection, but there is no valid reason, in our opinion, why these structures should be built in winter any more than were the old-time brick structures.



HARD TILE FLOOR ARCH IN THE HORNE BUILDING.

"As so-called fireproof buildings are not equally and to the same degree protected against fire, we would recommend to the insurance companies that they should vary the rate of insurance for this class of building, depending upon the character of the fireproofing used. The competition between fireproofing companies has been so severe as to reduce the price of their output in very many instances at the expense of quality. The large fire loss in the Horne building would still have been larger had the fireproofing been of poor quality; and we would further recommend the insurance companies to have prepared standard specifications governing the character of the 'fireproofing' and the construction and putting up of same, and requiring owners of buildings to use 'fireproofing' subject to these specifications under careful inspection, or be subjected to higher insurance rates."

INTERNATIONAL FIRE SERVICE COUNCIL.

THE International Fire Service Council, which was constituted in 1900 and initiated the Fire Service Congress of Berlin in 1901 and Budapesth in 1904, is gradually becoming a very representative institution of the fire service and fire preventive movement in its widest sense.

As all new institutions, it has naturally met with many obstacles, which were in this case complicated by the difficulty of language and customs of the different representatives serving on this body, and also by frequent misunderstanding of its primary objects, which are (1) to serve as an enquiry office, (2) to serve as a centre for issue of statistical reports of international importance, and (3) to systematize the International Fire Congress arrangements in such a manner that there is a sequence in the subject matter under consideration. The Council is not intended for the promotion of international uniform legislation, as has been frequently erroniously stated.

The representation of some of the countries has been recently completed under the new statutes, which statutes arrange for the representation to be in proportion to the number of inhabitants within certain limitations. Thus for the first five million inhabitants of any one country (or any part thereof) there are five representatives, and for every additional five million inhabitants one additional representative, the maximum number of representatives, however, being fifteen. Under this system of representation Great Britain (exclusive of the Colonies) has twelve represenatives. These represent respectively the National Fire Brigades Union, the British Fire Prevention Committee, the Association of Professional Fire Brigade Officers, the Salvage Service, and the number includes two founders.

The last general meeting of the Council was held at Budapesth in August; the previous business meeting of the Executive at Luxemburg in February; and the current business meeting will be probably held during April. Previous to this there have been general meetings in London (1903), Berlin (1901), and executive business meetings in Paris and Brussels. We present herewith some extracts from the statutes, and we also give a list of the British representatives.

The British Representatives on the Council (12).

Representing the National Fire Brigades Union (founded 1888):—

(1) Dixon, Lieut.-Colonel, late Chief Officer, Sutton Fire Brigade; Vice-President, National Fire Brigades' Union.

(2) Seabrooke, Lieut.-Colonel, Chief Officer, Rugby Fire Brigade; Chairman of the Council of the National Fire Brigades' Union.

(3) Folker, Gen. Hon. Secretary, National Fire Brigades' Union; Hon. Chief Officer, Aldershot Fire Brigade.

Representing the British Fire Prevention Committee (founded 1897, incorporated 1899):—

(1) Sachs, Chairman, British Fire Prevention Committee; Vice-President, National Fire Brigades' Union.

(2) Marsland, Gen. Hon. Secretary, British Fire Prevention Committee; Hon. Chief Officer, Painswick Fire Brigade.

(3) Collins, Member of the Executive, British Fire Prevention Committee.

Representing the Association of Professional Fire Brigade Officers (founded 1903):—

(1) Paterson, Chief Officer, Glasgow Fire Brigade; President, Association of Professional Fire Brigade Officers.

(2) Thomas, Chief Superintendent, Liverpool Fire Brigade; Hon. Secretary, Association of Professional Fire Brigade Officers.

(3) Tozer, Chief Officer, Birmingham Fire Brigade.

Representing the Salvage Service:—

(1) Fox, Lieut.-Colonel, Chief Officer, London Salvage Corps: Vice-President, National Fire Brigades' Union.

Founders:—

(1) Dyson, Chief Officer, Windsor Fire Brigade.

(2) Kusel, Resident Delegate in Grea Britain of the Belgian, French, and Italian Fire Brigade Federations.

Extracts from the Statutes.

Objects.—The International Fire Servic Council shall be a permanent association having for its object the encouragement o progress in the organization of the means o fire extinguishing, fire prevention, the saving of life and salvage service.

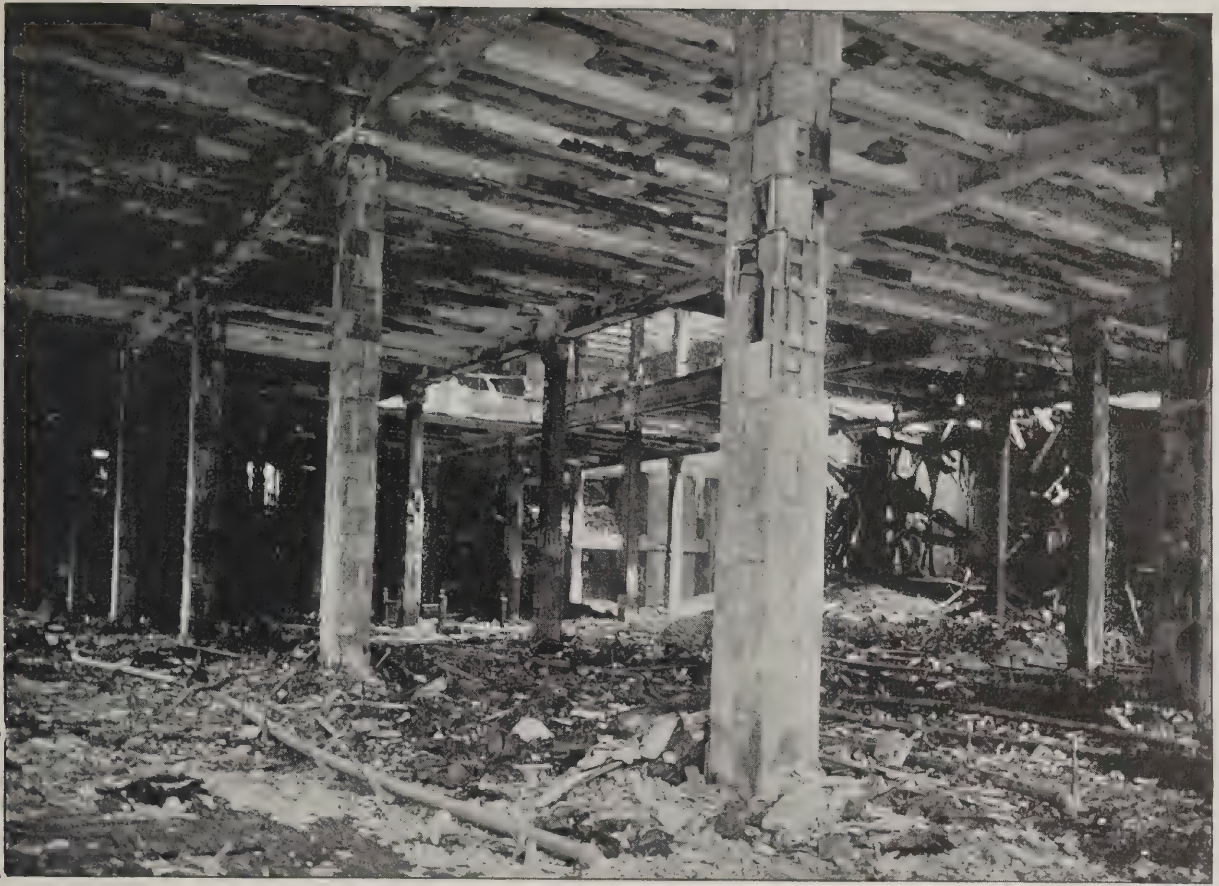
Representatives.—The Council shall comprise a number of representatives of differen countries. Every politically independen country can be represented on the Counci by members nominated by the local fir brigades' union, fire prevention societies o salvage societies; and the number of representatives shall be in proportion to the population of the country represented on th following basis: any country with a population of ten millions, according to the las census, shall have five representatives, an for every additional five millions it sha have the right to nominate a further representative; but the representatives of any on country shall never exceed fifteen. (Grea Britain is entitled to twelve representatives In cases where the representation of severa bodies belonging to any one State is proposed, the Executive alone shall decide upo the number of representatives to be accorde to each such body on the Council. Applications for membership, whether from recognized fire brigade unions, recognized fi prevention societies, or salvage societies, from individuals in their private capacit shall be addressed to the Executive, wit whom the decision as to their acceptance refusal solely rests. Members shall be electe by a majority of votes of the Executive, an membership shall not be definite until aft receipt of the necessary subscription.

Subscriptions.—The expenses of the admi istration of the Council shall be met by fund derived from the following sourc namely: Members' subscription, grants a donations. (*Note.*—Great Britain's twel representatives subscribe to the headquarte fund an aggregate of 110 francs [£4 8s.])

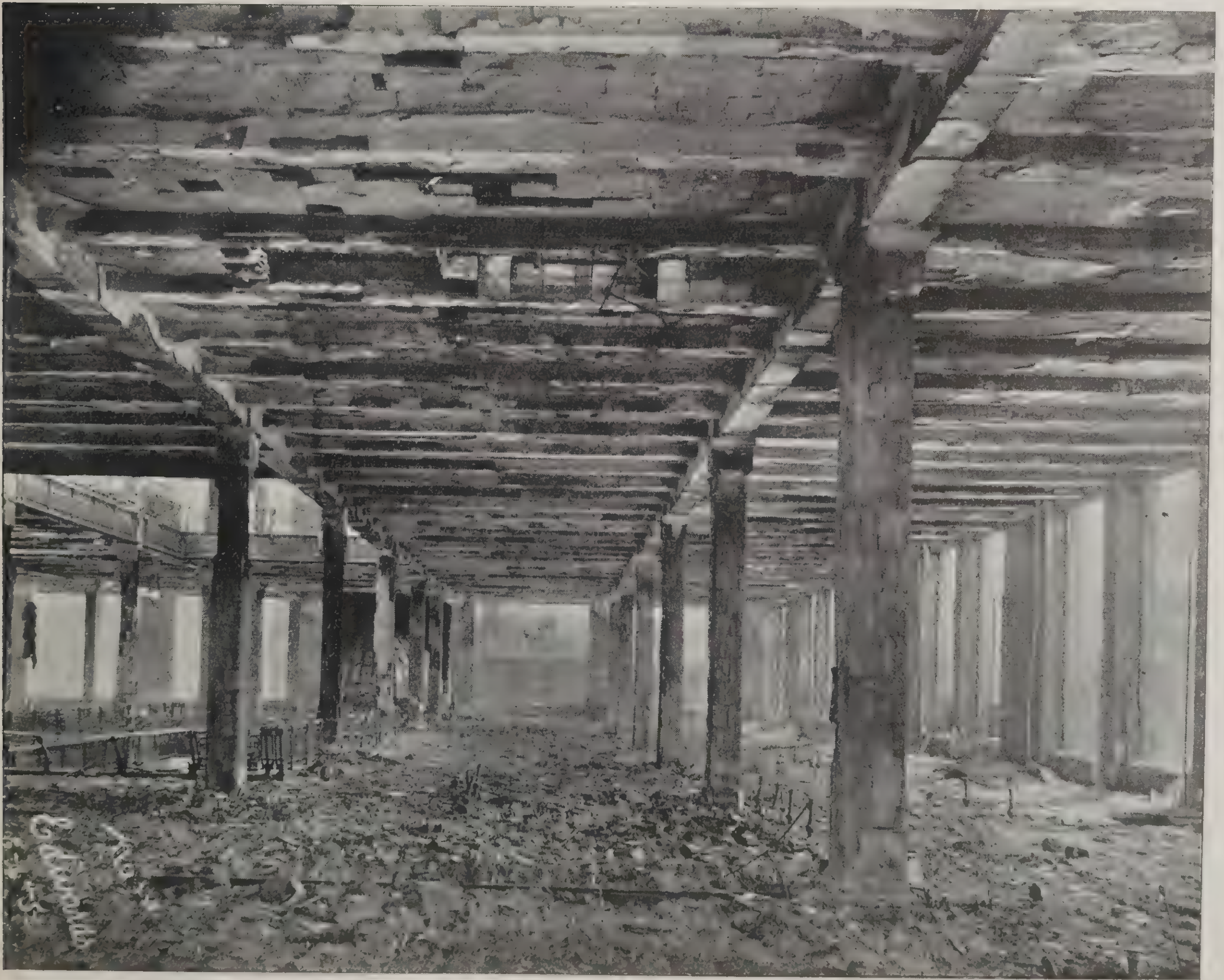
Meetings.—In the event of there being International Congress, the Council sh meet at least once in three years.

Voting.—The system of voting at a meeti of the Council shall be as follows:—Eve representative of a country shall have a vo and in the event of a representative not bei able to attend a meeting he shall have right to transfer his vote to another rep sentative of the same country, advising secretary of this, in writing, at least for eight hours before the date of the meeti Should the Executive so determine, the voti can be by correspondence.

Executive.—The Council shall be rep sented and its business conducted by Executive consisting of eleven members. T Executive shall meet at least once a ye The duties of the members of the Execut shall be honorary.



INTERIOR OF HORNE BUILDING AFTER THE FIRE, SHOWING TILE PROTECTION TO COLUMNS AND LIGHT-WELL IN CENTRE.



INTERIOR VIEW OF HORNE BUILDING.

THE ENTREPOT ROYAL, ANTWERP.

THE city of Antwerp has long been notorious for its fires, and it has had quite a number of remarkable conflagrations during the few years of the new century.

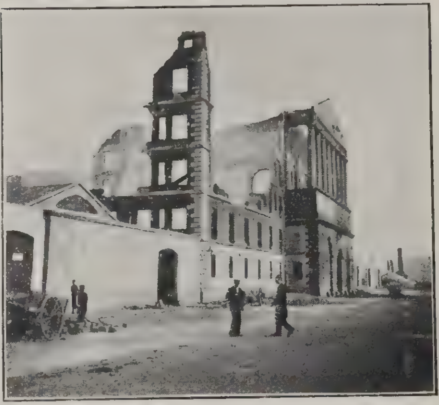
There can be no doubt that when a city has so many fires there must be something radically wrong, be it in respect to its building legislation, its fire service or its fire survey, or be it in respect to all these three departments.

Such fires as the petroleum fire in the Hoboken suburb, which we illustrated in our first "Fire Supplement," certainly need not occur, and the one which we are dealing with in this instance, namely, the Entrepôt Royal fire of 1901, could certainly have been avoided with reasonable care and management.

The premises of the Entrepôt Royal at Antwerp serve as a very interesting object-lesson for the students of fire protection in more senses than one.

In the first instance the actual fire at the Entrepôt serves as a lesson in the negative sense; further, the new Entrepôt Royal, which takes the place of the buildings destroyed by fire, serves as an example of how a thing can be done admirably to the extent of nine-tenths and then be spoilt owing to a faulty final tenth. There is not the slightest doubt that in conception and planning the new Entrepôt Royal is as excellent as the old was faulty. Everything that money and modern construction can do to make the new Entrepôt Royal fire-resisting has been done, and yet for some reason, be it that of the lack of understanding of the primary principles that should govern the precautionary measures in a warehouse of this kind, or be it merely a question of negligence or carelessness, this excellent block of buildings is still subject to considerable fire risk.

In the first place we will deal with the fire at the Entrepôt Royal, and for this purpose we will avail ourselves, of some notes by Mr. Ellis Marsland, the district surveyor for Camberwell, who visited the scene of the fire a few days after the conflagration. Regarding the new Entrepot Royal, we will utilize the facts presented by the chief officer of the local fire brigade, Mr. Scheppers, in the form of a contribution to the recent International Fire Prevention Congress of 1903, but we supplement these with some notes from the pen of an insurance engineer who recently had the opportunity of inspecting these buildings in actual working state.

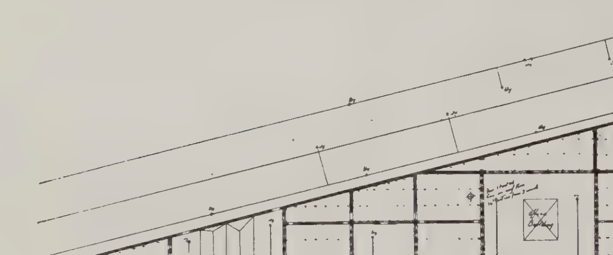


VIEW DIRECTLY AFTER THE FIRE.

We are fortunate in being able to present rough plans both of the old buildings and the new ones; we are able to present some details in both instances; and further we have been favoured with excellent photographs.

The Entrepot Royal Fire of 1901.

The Entrepôt Royal is the Government Bonded Stores at Antwerp. The warehouses, as may be seen by the plan, consisted of a series of buildings in three main blocks, each six storeys in height, fronting the Quai de l'Entrepôt, and designated the north, central and south blocks, and connected in the rear towards the Avenue du Commerce by buildings of lesser height. There were in addition a number of one-storey buildings, which are indicated by crossed diagonal lines. The buildings dated from 1830, and were erected with brick walls treated architecturally with stone, but with no claim to be of fire-resisting construction. The floors were principally of wooden joists carried upon wrought-iron girders and supported by cast-iron columns, the ends of the wrought-iron girders being let into the walls and connected on the outside by plates and washers. This accounted to a large extent for the so complete destruction of the buildings, inasmuch as the falling of the floors and ironwork dragged the walls over and brought about the total wreck referred to later on.



DETAIL OF FLOORS DESTROYED IN THE OLD ENTREPOT ROYAL.

There were cross-walls dividing the buildings up into sections, but these walls terminated below the roof, had many openings in them, imperfectly closed with badly-fitting single iron doors, and in some cases with none at all. The staircases were of wood.

The buildings were used principally for the storing of bonded goods, such as coffee, sugar, wool, tobacco, tallow, hardware and fabrics, but some of the floors were let to private tenants, and it was in one of these tenancies the fire commenced. The exact spot was on the top floor about 24 metres from the ground, indicated by the mark ø on the plan, and it spread along the roof in either direction.

The whole of these buildings, practically all communicating and adjoining and filled with most inflammable materials, were little calculated to resist the spread of fire, and in addition to this the fire starting in the roof storey, the extinguishing appliances were unable, through want of water pressure in the hydrants and lack of more powerful steam fire-engines, to touch the fire until it reached the lower storeys.

The fire occurred on June 5th at 2.30 p.m., and the brigade was called at 2.40 p.m. By 3 p.m. the fire had extended for about 2 metres towards the west, and ten minutes later had reached the eastern corner, and also in a westerly direction from the origina seat of the fire for about 40 metres. Five minutes afterwards the roof over the portion where the fire originated commenced to fal in, and by 3.25 p.m. the fire had rapidly increased and the smoke and heat were driving across the courtyard to the south wing.

At 3.30 p.m. the walls of the central block south side, began to fall, and the whole wa in flames from top to bottom.

At 4.30 p.m. the buildings of the centra and south blocks were well alight, and b 6 p.m. the whole of the roofs and floors ha fallen and were a burning ruin, which wa not extinguished for many days.

The only portion saved was the nort block. The northerly breeze which wa blowing assisted the efforts of the brigade i preventing the flames leaping across th courtyard, although in the other direction greatly helped in spreading the fire.

The New Entrepot Royal.

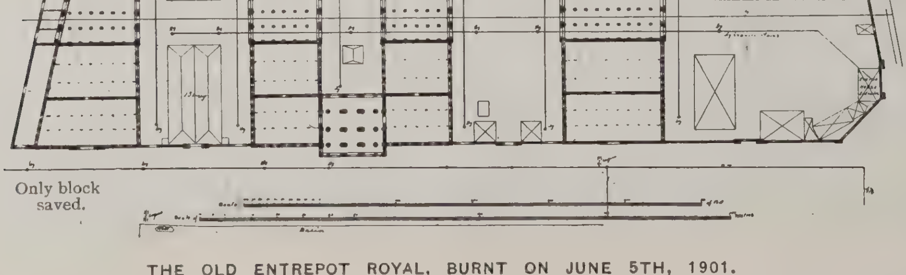
The following are the particulars of th new Entrepôt Royal and the principles th guided its erection, as recently presented b Chief Officer Scheppers as a contribution the Congress referred to.

It was decided to make the rebuilding the Entrepôt the occasion for a competiti in accordance with a set of conditions, which those clauses which specially intere us are as follows :—

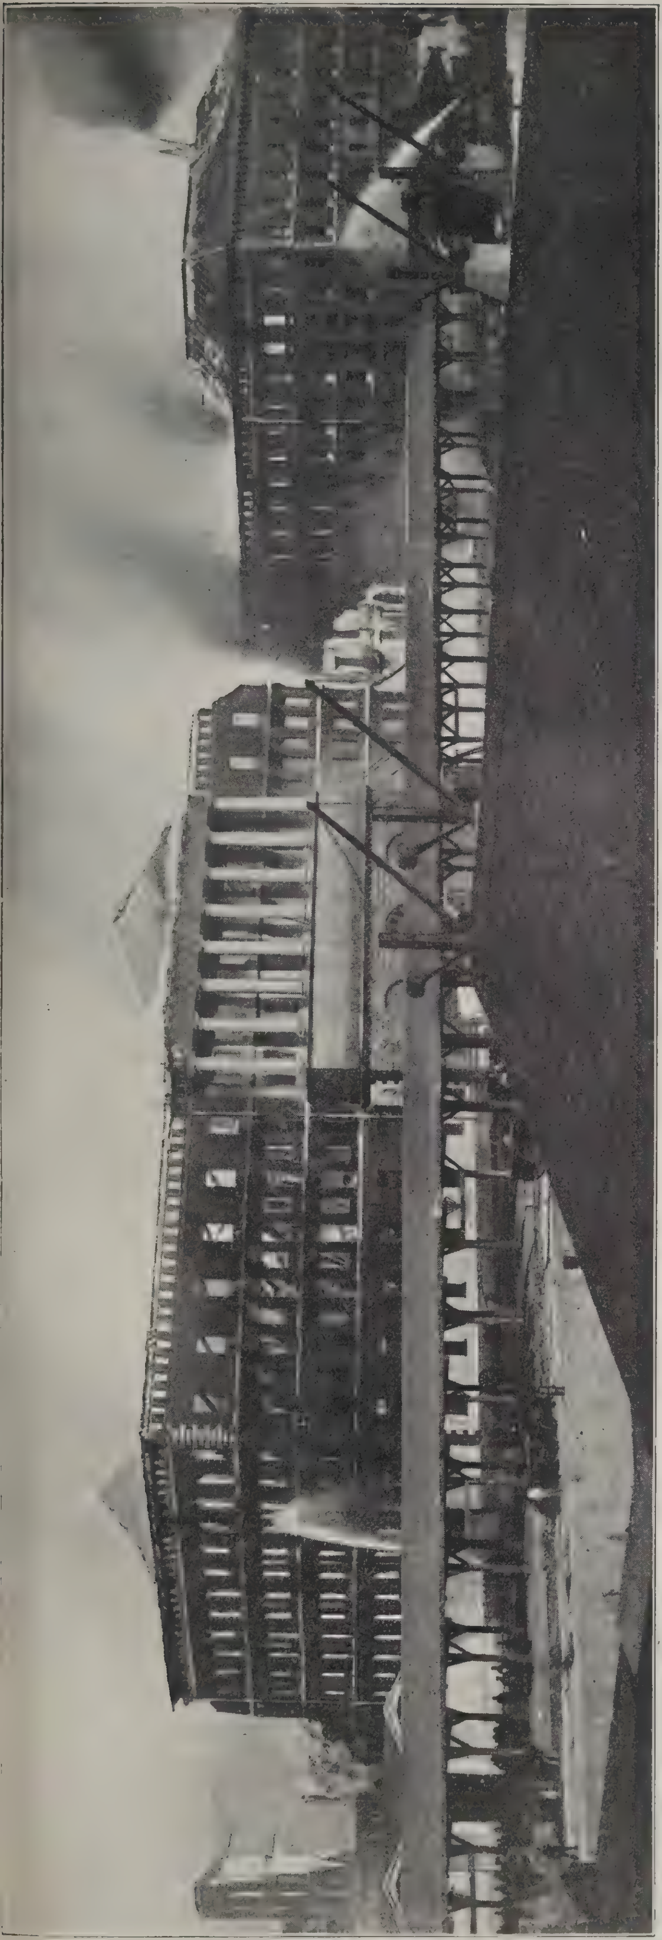
"The buildings shall be entirely construct of incombustible materials, such as bric concrete and metal. They shall be design from the point of view of the spread of fi and therefore divided into compartments n communicating one with another. T staircases giving access theteto shall outside, at any rate from the first stor upwards; lift wells to be capable of bei closed by metal doors Balconies projecti about 4½ft. shall be fixed at the level of ea storey, and shall run the whole length of t side next the courtyards.

"The widow frames shall be of metal concrete, the glazing in wired Bohemi glass as per sample deposited at the to hall. The frames shall be fixed, but sh have ventilating openings so arranged th they can be easily stopped externally in c of fire.

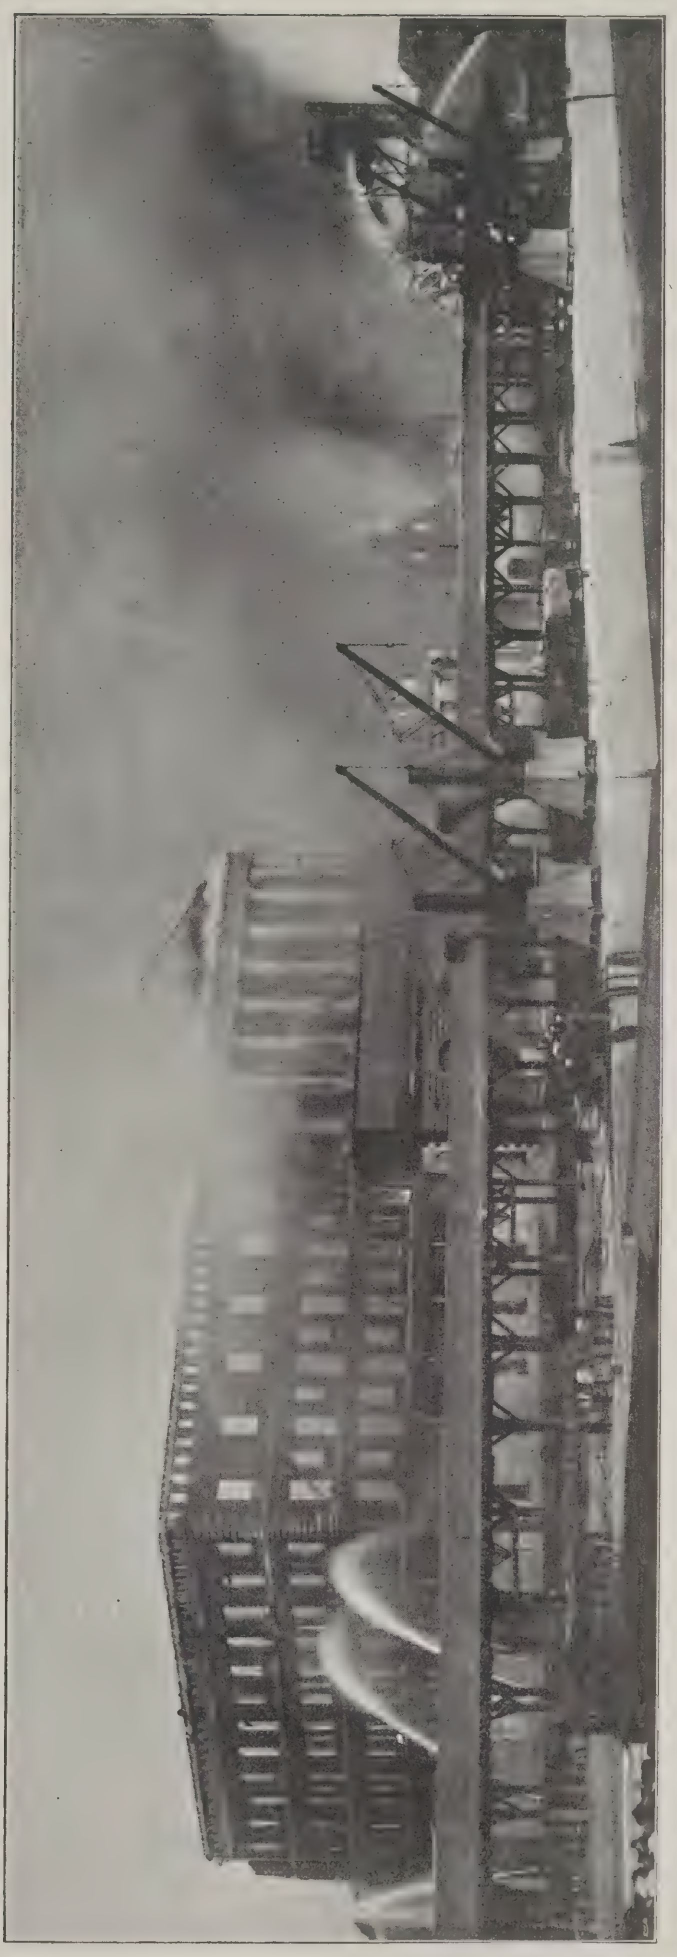
"Arrangements shall be made for draini off water from each compartment of warehouse so as to limit damage. The flo shall have a slight slope.



THE OLD ENTREPOT ROYAL, BURNT ON JUNE 5TH, 1901.



VIEW SHOWING THE FIRE AT THE ENTREPOT ROYAL, "ANTWERP, AT 6 P.M. ON JUNE 5TH, 1901.



VIEW SHOWING THE FIRE AT THE MOMENT OF THE FALL OF THE WEST FRONT OF THE SOUTH WING.

VIEWS OF THE NEW ENTREPOT ROYAL, ANTWERP.

"The contractor shall so arrange that it may be possible, without pulling down any part, to erect on each block a structure carrying a reservoir of 100 cubic metres capacity.

"The roof shall be flat, sloping slightly towards the outside walls, and shall be formed of a waterproof covering of tarred felt or cement on wood under a 6in. layer of Rhine gravel.

"The front and party-walls shall be carried above the roof and protected by stone or other incombustible material."

In this clause, it will be noticed, it is not laid down that armoured concrete shall be employed, for, although numerous experiments have proved its great resistance to fire, everyone was not agreed as to its stolidity. In other words, the formula for calculating the strength of armoured concrete beams had not then been definitely fixed.

The following clause set out the loads to which the different floors were to be submitted:—

"The loads to be carried by the floors shall be 2,000 kilogrammes per sq. metre (about 2 tons per sq. yd.) for the ground, first, second, third and fourth floors, and 1,000 kilogrammes for the fifth floor and the attic of the large shed. The contractor must provide at his own cost these floors and columns capable of supporting loads one and a half times superior to those estimated; they must accord with the plans and have a span not less than one-tenth of the whole span, and the trials shall be made simultaneously at all the storeys, the portions loaded being vertically superposed."

As was to be expected, all the competitors submitted plans in armoured concrete. After careful examination, the plans of Messrs. Bolsée & Hargot were adopted. At the same time, in deference to the views expressed by the Chamber of Commerce, a storey was suppressed as well as the sheds connecting the different blocks.

The reconstructed buildings comprise—

(1) Three large blocks (ground floor and four storeys), which, with the northern block which escaped the fire, formed the Entrepôt. (2) The store called La Plata (ground floor and three storeys) and the adjoining large shed (ground floor and one storey).

The façades and dividing walls have been carried out in brick and cement-mortar. The ceilings, columns and terraces are of protected cement on the Hennebique system. The tests carried out according to the specifications proved the great resistance of the materials.

All the glazing is in Bohemian wire glass. There can be no question of fixing the glazing directly in the protected cement, as space must be given for the play of expansion. At the Antwerp Entrepôt the glazing is held in frames of the Fabry pattern, which allow for this expansion while offering great resistance to fire, as the recent tests at Brussels have demonstrated.

Each block is divided into several compartments independently of each other, and acces is obtained thereto by doors leading to gallery 4ft. 8ins. broad running the length o the lateral façade.

The stairs are likewise isolated, and afte the first storey they are enclosed in projection or exterior stairways.

In every other respect the conditions lai down in the specification quoted above hav been observed.

All the iron swing doors provided for i the scheme have been replaced by meta doors on the Kinnear system. They ar formed of sheets of steel so arranged tha there is free play for any expansion to whic they may be subjected in any direction. B the employment of these doors space is gaine as they work around a steel beam fixe above the bays. The working by means of a endless chain and the system of padlockin

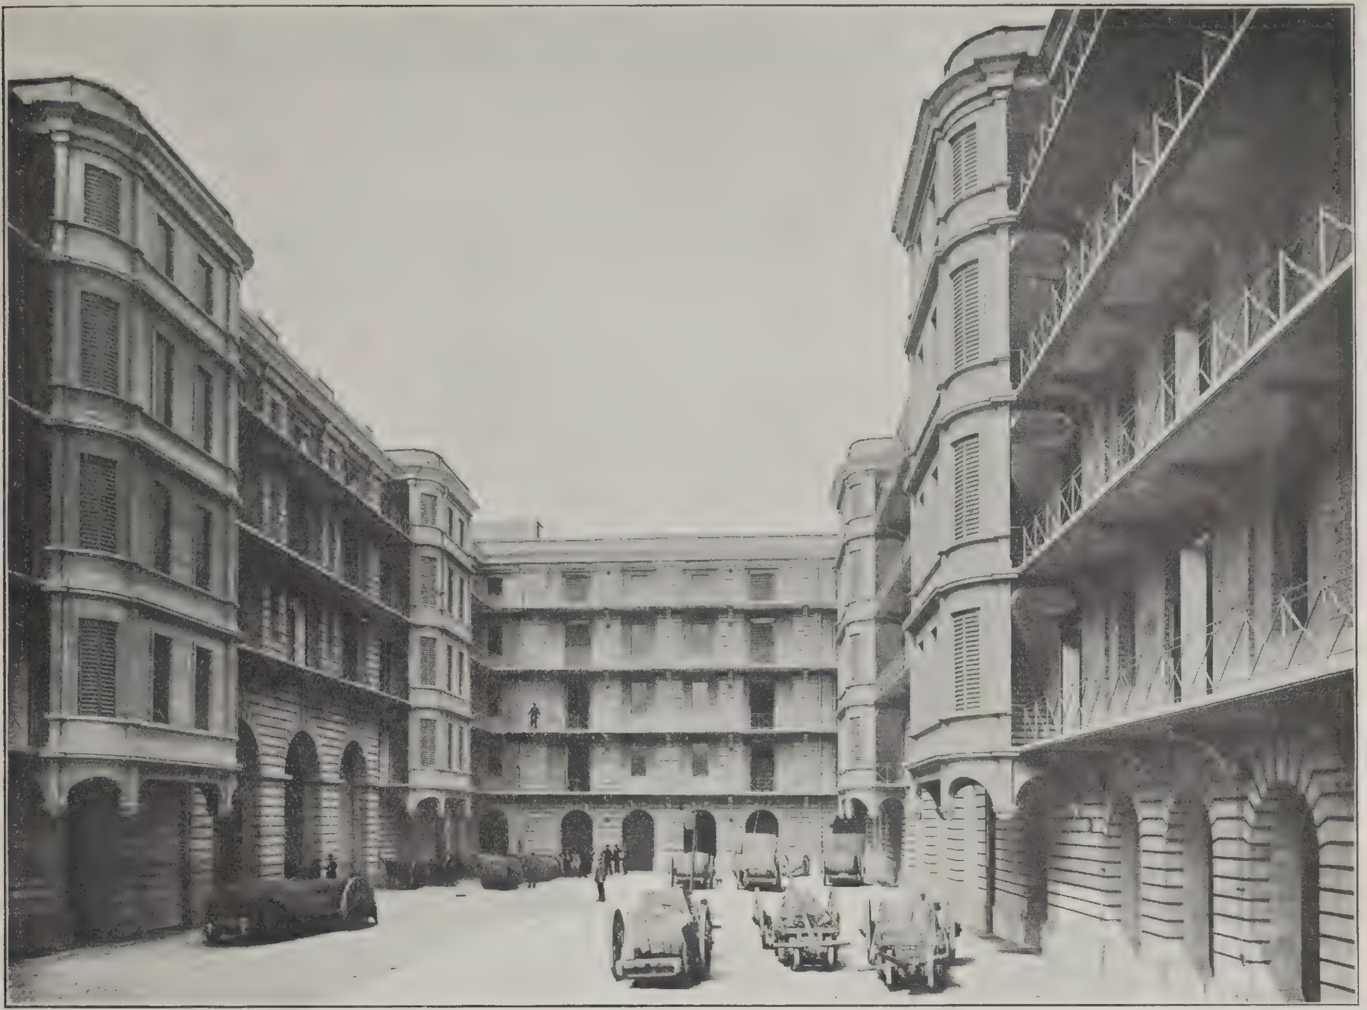
THE NEW ENTREPOT ROYAL, ANTWERP.



THE NEW ENTREPOT ROYAL, ANTWERP: THE CENTRAL COURT.

s most simple. Finally, the tests proved hat these doors offer a good resistance to re, and work as well after the fire as efore.

The Entrepôt is served by fourteen electric ifts, eight of which have a capacity of ,000 kilogs. and six of 600 kilogs. and four ranes attached to the façades. The lift vells are placed against the dividing walls n such a manner that each lift communiates by means of its doors with two adjoinng compartments.

Two electric cables are carried up through he lift well to a space on the roof built in vith armoured concrete in which the motor as been located. The latter is worked by ne of these cables, while the other cable ommunicates with the different doors. On eaching a landing the lift itself unlocks the oors and allows them to be opened. At the ame time this system prevents the opening f more than one door at a time; further, is necessary to shut each door before the ft will move.

A last detail. In spite of the fact that one torey and the connecting sheds between the arious blocks have been abolished, it is ossible, thanks to the solidity of the floors, store twenty-one million kilogrammes about 19,260 tons) more goods.

A Criticism of the new Building.

Reading this description, it might be ssumed that perfection had been nearly eached.

Perfection had as a matter of fact been very nearly reached, but for the neglect of certain points which are more than remarkable, and remind us of the notorious three large holes in the surrounding walls of the Antwerp ferro-concrete petroleum enclosure, which were left practically to invite the entrance or exit of burning oil, and referred to when speaking of the Antwerp petroleum fire.

We are presenting an insurance surveyor's comment on these faulty points, and trust that in the event of their reaching the right hands a remedy may be found before it is too late.

Our informant writes that the idea upon which the foregoing arrangements are based, at the Entrepôt Royal, if perfectly carried through, would be excellent, and with provision for the early discovery of an outbreak of fire, and the prompt attendance of a well-organized fire service with suitable extinguishing appliances, a serious spread of fire should be prevented. The ultimate value of all fire-resisting buildings is, however, only that of their weakest part; it may, therefore, be instructive to remark some weak points that were observed.

The floors, beams, columns, enclosures to staircases and the balconies as indicated are of reinforced concrete. From the scantling and form of some of these members, it is, however, to be feared that the thickness of concrete in front of the metal reinforcing rods is not sufficient to prevent continued heat seriously weakening their tensile resistance.

Lifts pass through all floors of several of the compartments enclosed with thin incombustible partitions, which have lofty door openings provided with light iron doors of poor construction which did not close properly. A spread of fire by means of these doors is practically a certainty. In addition, openings about 9ins. diameter occurring in the concrete floors had been left. For what purpose these openings were formed is not apparent. They would allow of the rapid spread of fire, and lead to much damage by water.

The sub-division of the vaults, in which tallow and vegetable oils are stored, is stated to follow that of the compartments over, but openings are believed to exist in some of these division walls.

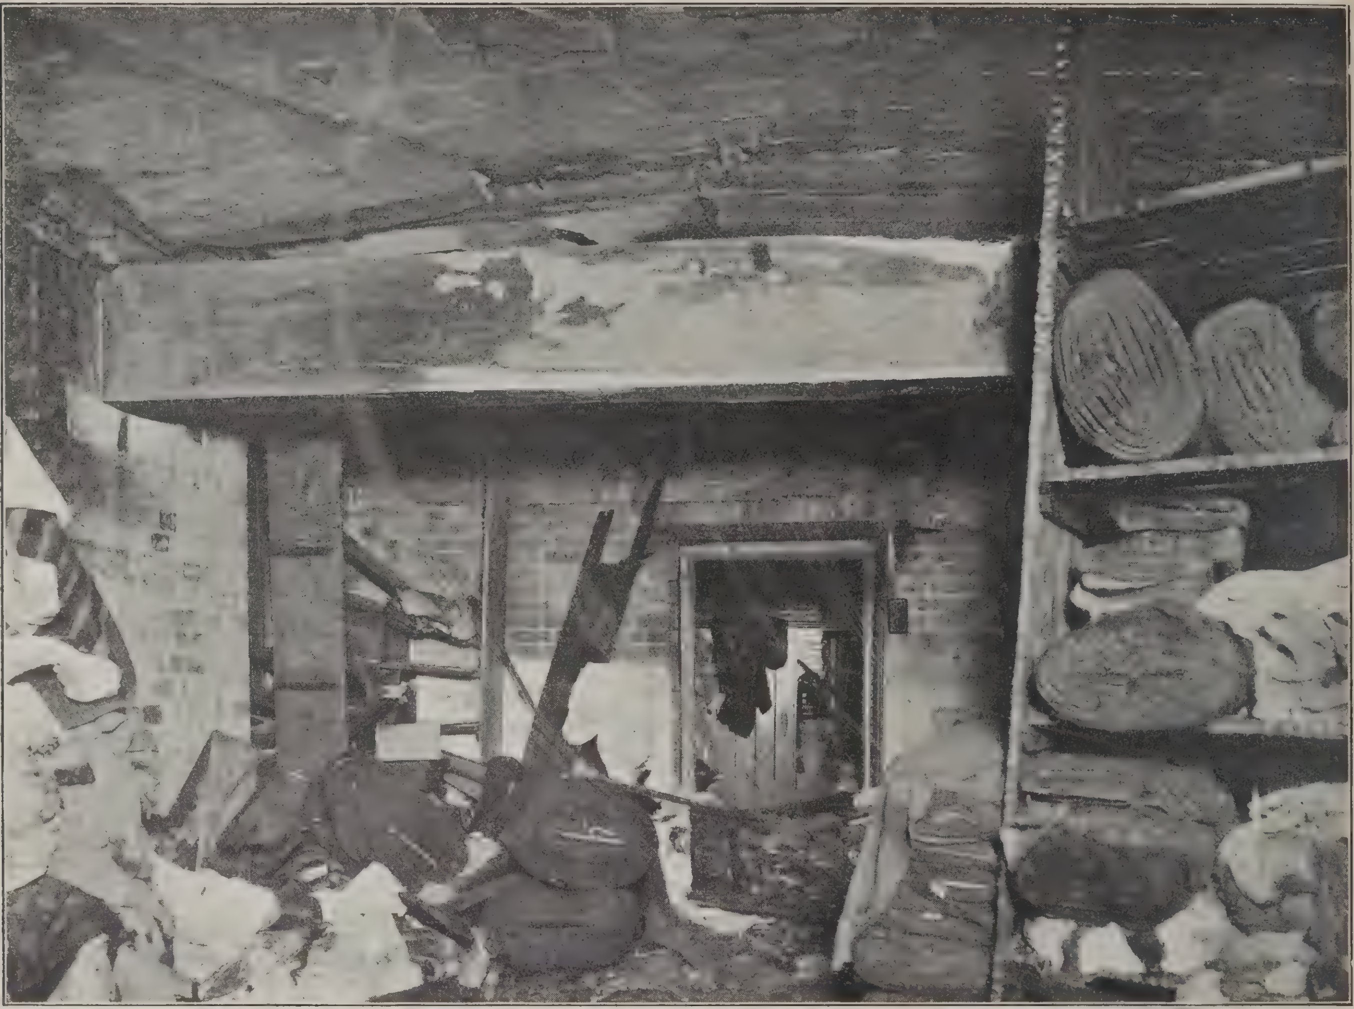
The use of compartments for goods of a similar character only is not observed, and very little attention appears to be given to a classification of the goods stored.

One old block which had not been destroyed in the fire of 1901 has not yet been rebuilt, and thus is a menace to the Entrepôt.

We think these criticisms should not be overlooked. We would add some of our own, namely, our opinion that the aggregate of the concrete used may not be as suitable for fire-resisting purposes as anticipated; that there did not seem to be sufficient first-aid appliances to meet a small outbreak, and that there was no system of fire patrol as we understand it.

Particulars of Fires.

Authentic technical particulars dealing with fires are invited from readers, more particularly where they deal with structural points of interest or questions of the efficacy or inefficiency of any special forms of structural work. Contributions should be marked "Fire Supplement" and addressed to the Editor, BUILDERS' JOURNAL, 6, Great New Street, E.C.



VIEW IN THE BASEMENT OF SHOP IN COSMO BUILDINGS, SOUTHAMPTON ROW, LONDON.

"BLOOMSBURY GAS EXPLOSION."

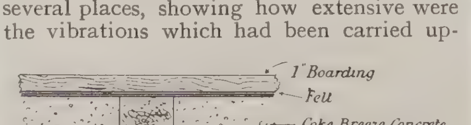
WE published on p. 29 of our "Fire Supplement" dated December 21st last an account of the explosion of gas which occurred about 2 o'clock in the afternoon of December 14th in the basement of the shop occupied by Mr. Barber, draper, which is at the corner of Cosmo Place, Southampton Row, W.C., in the extensive block of buildings known as Cranston's Waverley Hotel. This explosion was of a very violent character, causing considerable damage to the buildings in the vicinity and injury to a number of people engaged in the buildings and neighbourhood.

The glasswork to this building, and to others around, suffered very greatly, and the pavement of flags 4ins. thick around Mr. Barber's shop was broken up, and the fragments hurled in all directions; the flagstaff at the top of the hotel was brought down, and many incidents took place which bear testimony to the remarkable force of the explosion.

The ground floor of the shop, which received the full force of the explosion beneath, was constructed of Granolithic concrete; this rested upon the upper flanges of the steel joists and walls which formed bearings. These joists are in this particular floor about 8ft. apart, and the thickness of Granolithic is 3½ins. The rolled joists were not encased in Granolithic, but were treated with metal lathing and plaster in the usual way. The Granolithic slabs measure about 18ft. by 8ft., and have a mesh of round steel tension-rods near the soffit, these rods forming a mesh of about 4ins. by 3ins. The work was laid about June, 1899.

The photographs show what took place. The force of the explosion caused an upheaval of the whole of the shop floor, causing it to assume an arched form, the arch extending from wall to wall and having a span of about 17ft. with a rise of about 10ins. The tenacity and soundness of the material is well attested by the arch shape assumed by the floor and the absence of rents or open cracks in the concrete composing it. The Granolithic has been drawn away from the walls of the room, but has nowhere—as in the case of the heavy skylights and flagging over the areas round the shop—been blown right away from its initial position.

With reference to the floor at the first-floor level, which is above the shop, and forms the floor of the ladies' drawing-room, &c., in the hotel, the Granolithic floor has not left the joists, and upon examination no noteworthy defects were observed. These Granolithic slabs are about 18ft. by 11ft., resting upon the upper flanges of 14in. by 6in. steel joists, and wall bearings; their thickness is 4¼in., and they support light partition walls which are built thereon. These latter walls, between first- and second-floor levels, were found to be cracked in several places, showing how extensive were the vibrations which had been carried upwards through the building. The first-floor Granolithic slabs have a mesh of round steel rods at their underside, measuring about 2½ins. by 3½ins., the formation of the floor being according to the sketch here reproduced.



SECTION OF GRANOLITHIC FLOORS AT FIRST-FLOOR LEVEL.

We are of the opinion that the behaviour of the ground floor of the shop has to a large extent prevented a very disastrous result to a considerable portion of the building.

Messrs. Stuart's Granolithic Stone Co., Ltd., were the specialist contractors for the floors.

AN AMERICAN SOCIETY OF BUILDING COMMISSIONERS.

A SOCIETY called the International Society of State and Municipal Building Commissioners has been constituted recently in the United States at the instance of Mr. F. W. Fitzpatrick, consulting architect, of Washington. Its primary object is to seriously take up the question of fire prevention and to popularize that subject among the municipal officials entrusted with the control of buildings. The title is somewhat unnecessarily elaborate, and we believe the term "International" only refers to the two American continents—in fact, only to the North American Continent, *i.e.*, to the United States and Canada. But the object of the society is an excellent one, and, if carefully managed as an institution which desires practical as distinct from theoretical remedies should do considerable good. There is certainly ample room for improvement in the United States, a country which bristles with marvellously-conceived building Acts and regulations of a highly complicated character, generally ignored in a wholesale ıanner by all concerned. The first executive f the new society is as follows:—Mr. James Iulcahy, of Boston, president; Mr. G. U. Ieimburger, of St. Louis, first vice-president; Ir. Henry Rumrill, jr., of Buffalo, second ice-president; Mr. F. A. Pittman, of Atlanta, hird vice-president; Mr. James G. Houghton, f Minneapolis, fourth vice-president; Mr. Robert McCallum, of Toronto, fifth vice-ıresident; Mr. Alcide Chaussée, of Montreal, ixth vice-president; Mr. F. W. Fitzpatrick, of Vashington, D.C., secretary-treasurer; with Ir. F. L. Brown, of Scranton, Mr. F. H. llerbe, of St. Paul, and Mr. C. B. Cooke, of Wheeling, W. Va., as members of the xecutive committee.

The objects of the society are closely lefined in section 2 of article 1 of its con-titution, which is as follows:—

The purposes for which this society is organized are to secure a closer official and ersonal relationship between the repre-sentatives of the building departments at ıome and abroad; to secure more uniform uilding laws in all the cities; to collect from every source information relating to building matters, tests, &c., and the dis-semination of that information among those forming part of this society; concerted action toward the advancement of the sciences of construction; and particularly the adoption by the States and municipalities of means to secure as far as practicable the prevention of loss of life and property by fire.

FIRES IN 1904.

THE "Post Magazine" summary of January 7th gives the following particulars as to notable fires and fire losses during the year 1904:—

	£
Fraser's Bleach Works, Cullybackey	11,000
McCurdy's Bleach Works, Belfast	10,700
Miller & Co., Dyers, Cambuslang	7,000
Gale Calico Printing Works, Littleborough	13,000
Yarn Dye Works, Newton Heath	10,000
Rodgers (drapers), Windsor	15,000
Drapers in High Street, West Sunderland	18,000
Dailuaine & Talisker's Distilleries, Aberdeen	100,000
Worsted Mill, Keighley	40,000
Soap Factory, Aberdeen	25,000
Old Mill, Lowestoft	40,000
Silk Mills, at Halifax	50,000
Warehouse, Haydon Square, London	200,000

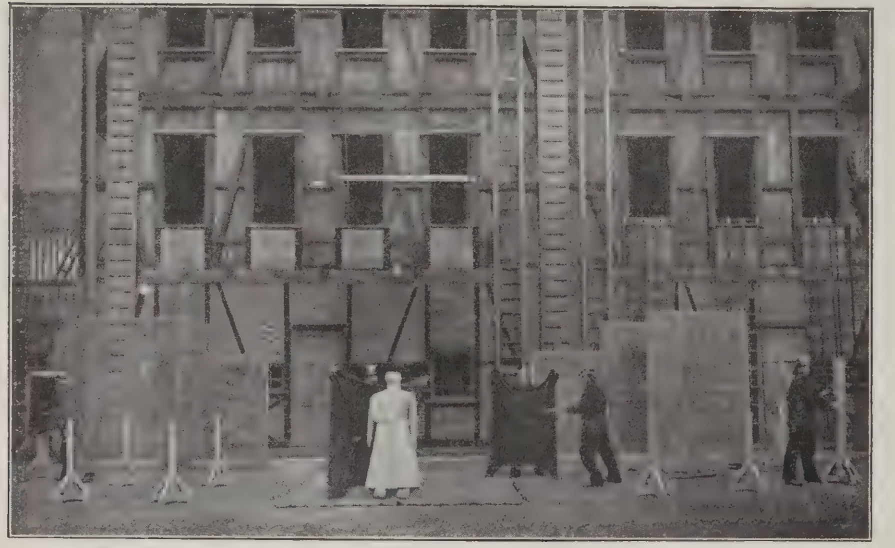
EFFECTS OF THE GAS EXPLOSION IN SOUTHAMPTON ROW ON DECEMBER 14TH, 1904.

Dummy cloth rack. Dummy Wings. Dummy Artist. Dummy Wings. Dummy Hydrant.



"THEATRE FIRE WATCH" DRILLING AT BERLIN.

As to the lessons of this fire, we do not think that there are so very many to be learnt in this country. To our mind, practically everything that was neglected at Chicago is already well provided for in London, and is gradually being provided for in the provinces. Only in one particular would we advocate yet greater stringency than set out in the Lord Chamberlain's new regulations for theatre safety, and the new conditions of licences issued by the London County Council. We refer to the non-inflammability of stage scenery. We consider that such scenery should be absolutely flame-proof, both as regards the canvas material and the wood battens or profile board of which it is constituted. The mere makeshift of painting should not be permissible; impregnation to our mind is essential. We are fully aware that the impregnation of existing stocks of scenery would be a great hardship on the managements, and for this reason we advocate that such impregnation stocks should be spread over a period of one or two years, or even more where large stocks have to be dealt with; but all new scenery should *ipso facto* be thoroughly impregnated. We are convinced that this is no financial hardship to theatre management, because (1) proper machine-made impregnated scenery can be turned out cheaper than scenery made on the stage by carpenters without machinery and out of unimpregnated materials, (2) because impregnated scenery carries with it a reduction of insurance premium if thoroughly and reliably carried out.

Thus we believe that the regulations referred to regarding non-inflammable scenery require strengthening, and administrating in the most energetic manner, for in the majority of cases the secret of fire protection in the theatre rests in the non-burnability of the stage and its appurtenances.

THE CHICAGO THEATRE FIRE.

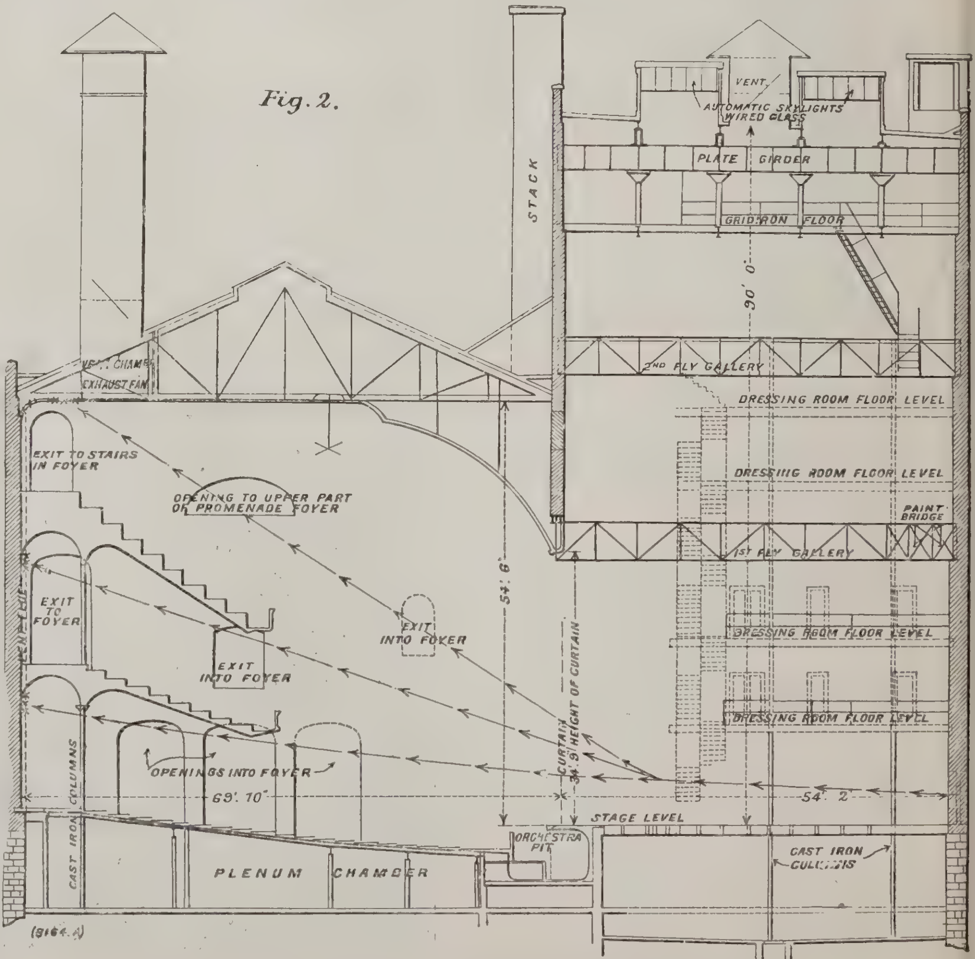
THE remarkable news reaches us from America that although the coroner's jury which investigated the causes of the catastrophe at the Iroquois Theatre, Chicago, severely condemned the theatre manager, numerous public officials and theatre employees for their neglect, all these persons will in no way suffer for the terrible results of their failings: in other words, there will be no punishment for that sad combination of ignorance and corruption which caused the terrible loss of life December, 1903. Further, we understand that performances are being given at the theatre, which has been little altered since the catastrophe.

If we dispassionately examine the long list of accidents occurring in the United States, be they railway accidents, street accidents or such disasters as that of the excursion steamer the "General Slocum," we are everywhere met with the fact that as a rule the loss of life is solely due to owners' wilful neglect of ordinary safeguards, together with corruption of public officials. This is no doubt a sweeping statement to make, but we regret to say we are convinced of its absolute truth; and the Chicago fire is only one of many instances where such neglect and corruption remain unpunished. Our American cousins are not behind us in the drafting of rules and regulations; the excellence of their building construction is well known; but all such advantages as they may thus possess are entirely discounted by the wilful neglect and corruption referred to.

We will not enter further into the natural conclusions any thinking person must arrive at regarding the much vaunted civilization and advance of the American nation, when such neglect and corruption are features of American public life.

We take the opportunity also of presenting, by way of reminder, a plan and section of the ill-fated theatre, so that the execrable planning of the building may not be too soon forgotten.

Fig. 2.



SECTIONAL VIEW.—ARROWS SHOW DIRECTION OF AIR CURRENTS.
IRCQUOIS THEATRE FIRE, CHICAGO.

ERLIN'S THEATRE "FIRE WATCH."

T is a matter not generally appreciated that ever since the early 'sixties the oyal Police Fire Brigade of Berlin has done e duty of "fire watches" in the theatres the Prussian capital. It is not our purpose here comment upon the advantages or sadvantages of the "fire watch" in a eatre being manned by firemen from the cal professional brigade. There are cer- inly very distinct advantages, but at the me time there are disadvantages. Thus e responsibility of the management de- eases in ratio to the increase of responsi- lity taken over by the public authorities putting "fire watches" into theatres.

Further, a system that would be eminently plicable in one country is not necessarily ually applicable in another, and thus what recognized as an essential in Berlin is not cessarily either essential or politic in ondon.

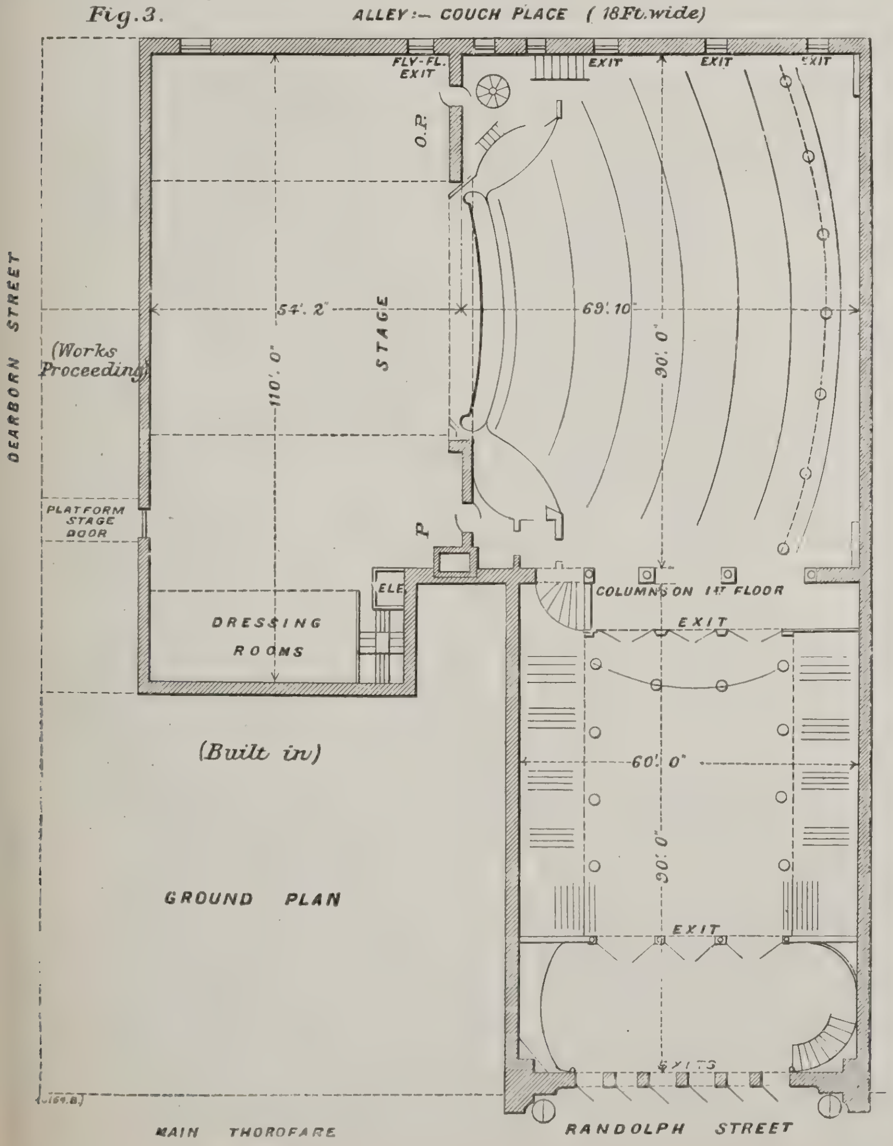
The fact remains, however, that as far ack as the 'sixties it was the recognized ing for the "fire watch" in every theatre be manned by professional firemen, and at during the last forty years this system as been gradually developed in such a way at we to-day find that the Berlin Fire rigade has an entire company of firemen, nown as the 6th Company, which com- any has been specially formed to take over fire watch" duty in places of public enter- ainment. This company, which is of con- derable strength and is in the special charge f two superior officers, is systematically ained to theatre work. So that the men hall not become rusty in their general fire practice, the men are transferred to and removed from this company at intervals, and the company also affords certain "reliefs" for the ordinary duty men during certain hours of the days—such as the dinner hour—so that the men keep their hands well in for the ordinary routine work and ordinary fire work although belonging to the special theatre section. The total strength of the theatre company comprises twelve foremen and fifty seven firemen. The "individual watches" vary in strength from one to twelve, the latter strength being at the Royal Opera House, a building requiring exceptional precautions.

Great efforts are made to keep the men on "fire watch" in good physical condition, and thus they are drilled daily and also have to do gymnasium work daily. The Berlin brigade suffers considerably from the tendency of its older and more experienced men to run to fat, and this necessarily requires very energetic handling. The special drills comprise a drill with cloths for wrapping up a human being whose clothes have caught fire, bucket drill, hydrant drill, iron-curtain drill, ventilation "flaps," "sprinkler" and fire-alarm drills, life-line work.

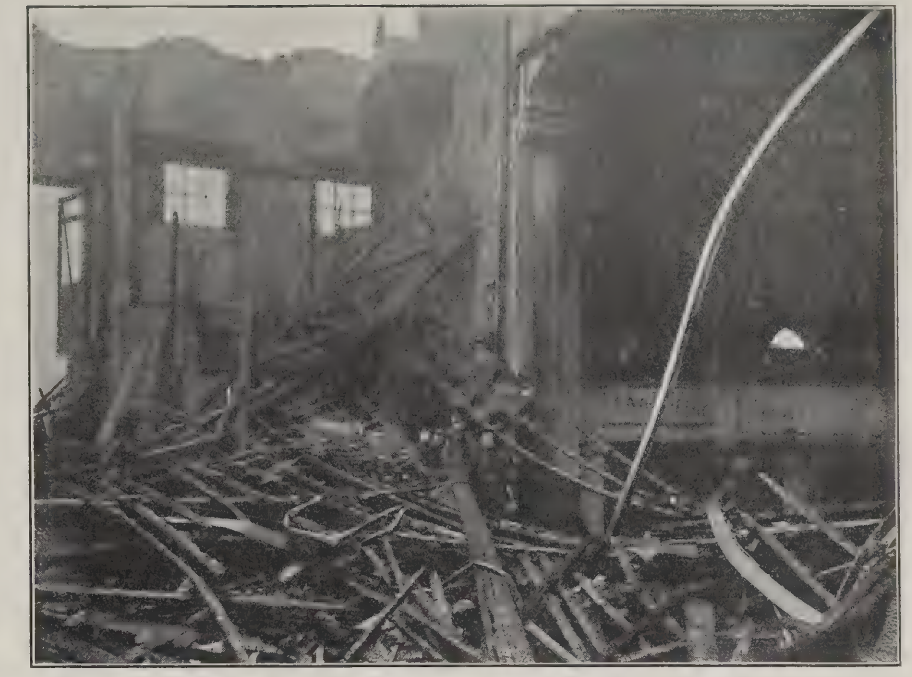
The illustrations which we reproduce are snapshots taken during a drill at the headquarters fire station; a dummy doll is being used, there are dummy wings, a hydrant, &c., and we see two men getting to work with cloths and two men setting to work with hydrants.

We believe this illustration is quite unique in the annals of theatre protection, and it may serve as a basis for the further development of the subject of "fire watches"—be they private or professional—in our theatres.

Fig.3.



GROUND PLAN OF IROQUOIS THEATRE, CHICAGO.



STAGE SIDE OF THE CROUCH END OPERA HOUSE.

CROUCH END OPERA HOUSE FIRE.

WE present a photograph of the stage of the Crouch End Opera House, which was destroyed by fire on Christmas Eve last, after rehearsal.

The entire stage portion was gutted, but a considerable portion of the front of the house remains intact.

We hope to be able to refer to some technical features in this fire at a later date, more particularly on the protection of the proscenium opening.

In the meantime we would, however, mention that the fire-resisting curtain which existed at this theatre was apparently not an asbestos cloth curtain, but a curtain of two thicknesses of canvas painted with a coat of asbestos paint, and the manner in which it was hung and the way in which the runners were fixed did not accord with the usual practice in the London County Council area.

THE FIRE AT THE EAST INDIA DOCKS.

THE EAST INDIA DOCK FIRE.

WE present a photograph of one of the bays of the East India Docks which will give some idea of the character of the buildings involved in the recent fire at these docks.

There is nothing of structural importance that claims recording in this fire.

It will be seen that for all practical purposes we have to deal with a fire that was in buildings of the dock shed class, filled with a considerable assortment of inflammable goods.

NEW FIRE TESTING STATIONS IN THE UNITED STATES.

PROFESSOR WOOLSON, of the Columbian University, New York State, who visited London on the occasion of the International Fire Congress of 1903, and particularly looked into the work of the British Fire Prevention Committee's testing sation at Porchester Road, besides recently issuing a valuable book upon the work of the Congress and the work of the testing station, has now organized a testing station on lines not dissimilar to those of the one in our metropolis, with, however, the rather curious exception that gas is not being made use of to assist in the application of heat and flame.

The testing station, which is known as the Columbia Fire Testing Station of the Columbia University, New York City, has the personal supervision of Professor Woolson, who is assisted by the students of the Mechanical Department of the University, and further has the co-operation of the City Building Bureau of New York.

The reports are got up very much on the same lines as those of the British Fire Prevention Committee, and are well illustrated by photographs and diagrams.

Tests, based on the London practice, have also recently been organized by the Boston Mutual Experiment Station at Boston, U.S.A., under the supervision of officers of the Mutual Factory Insurance Association, whose president, Mr. Edward Atkinson, visited London some years back and reported in considerable detail on the British Fire Prevention Committee's work, and afterwards also sent the vice-president, Mr. Gray, to be present at some investigations on this side of the Atlantic.

Owing to the standardization of tests arrived at by the British Committee at the International Fire Congress of 1903, it may be anticipated that in the course of the next few years' tests in most countries will be on identical lines, so that a test undertaken in any one country can be compared with that undertaken in another. If all these reports could be issued on exactly identical lines and even in the same style as the London ones, it would certainly be a great advantage to architects and builders and a matter of considerable economy for the owners of proprietary systems who are trading in several countries.

IMPENDING OFFICIAL FIRE TESTS.

WE understand that official fire tests will be conducted by the British Fire Prevention Committee this Wednesday afternoon, January 18th, with three electro-glazed casements of the British Luxfer Prism Co., of London, and with a partition of slabs 2½in. thick, erected by the Adamant Co., of Birmingham and London.

It is interesting to observe that the British Luxfer Prism Co. has already been up for investigation several years back, when they twice underwent the ordeal of tests with large casements and once with large skylights. This time the superficial area of a panel of electro-glazing is 4ft., in accordance with the recent official requirements. This is thus the fourth official test with this Company's glazing.

We understand that among the tests in hand is an important test of a concrete floor in which a set of broad flange girders are to be used, which are being provided by Messrs. Skelton & Co., who have specialized in this class of girder.

We also understand that an automatic Fire Alarm System is to be under test in February. This system is being put forward by a Danish firm, the Autopyrophon Co., of Copenhagen.

There will apparently also be some further door tests with varieties of hardwood doors during the Committee's present session.

The German Association of Professional Fire Chiefs has issued an elaborate report of its tests with so-called patent fire extinguishers and the like. This report, although of a very matter-of-fact character, has made a great sensation throughout Germany, and will probably eventually kill the present German trade in patent extinguishing mixtures, &c.

RECENT FIRE TEST REPORTS.

A Lamp.

THE British Fire Prevention Committee has issued two reports which are somewhat outside its regular routine, which up to the present has been mainly devoted to the testing of floors, partitions, doors and other structural work. The two reports issued dealt with a sprinkler, and a petroleum vapour lamp.

Regarding the petroleum vapour lamp (by Messrs. Petrolite, Ltd.), it is obvious from the report that its factor of safety is a very high one, but we observe that Mr. Ellis Marsland in a prefatory note particularly calls attention to the fact that the lamp tests refer to lamps filled and in actual use, and do not refer to the question of filling. In an appendix it is shown how the makers recommend that these lamps should be filled. If the makers' instructions be followed we think the filling operation should also not be a hazardous one, and we thus consider that the lamp generally is one that well may be recommended. We would, however, emphasize the necessity of care in the process of filling, which is not only a matter of obtaining suitable appliances but one that relates to the personal attention of those entrusted with the actual filling operation. With care the lamp should be a most efficient appliance, but it certainly requires care in the filling operation. The following is the summary of the official report.

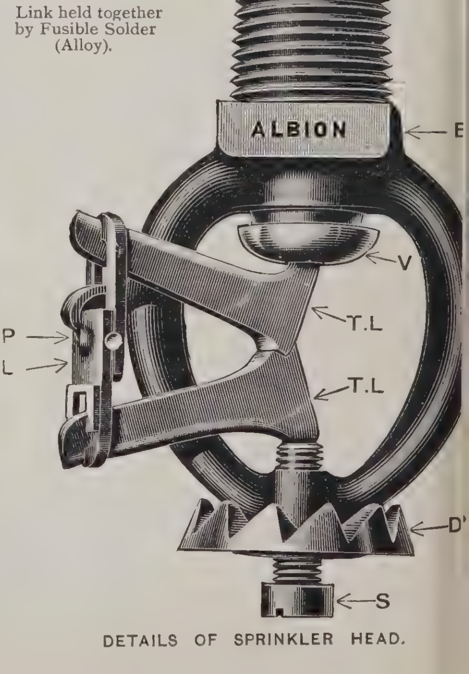
A Lamp called the Petrolite Lamp, and manufactured by Petrolite, Ltd.

Object of Test.—To test the safety of a lamp in the event of its being upset by accident or otherwise, also its liability to explode or give off explosive vapour after burning for a given period. *Note.*—Seven lamps of identical pattern were to be tested.

Summary of Effect.—The lamps stood the several tests made by the Committee as detailed, and on no occasion did the lamp fail to go out when upset, and no spirit escaped.

A Sprinkler.

The second test refers to a sprinkler, and is probably one of far-reaching importance, and for this reason it opens our eyes to the fact that although certain sprinklers are on the market marked to go off at 155 degs. Fahr., this does not necessarily mean that they will go off at the temperature so marked in actual practice. It simply means that the solde



DETAILS OF SPRINKLER HEAD.

not hold the parts together when in ing water of a temperature of 155 degs. ictual practice the temperature round the nkler can be easily 20 or 30 degs. higher ore the solder fuses, for the reason that metal of the sprinkler and piping conducts ay the heat rapidly: so rapidly in fact t until the pipes and sprinkler parts themes become sufficiently warm the sprinkler s not come into action.

he Albion sprinkler here reported upon, ar as we see, has come out very well in investigation, though, of course, also vhere near the recognized 155 degs.

Ve think it unwise of makers to stamp ir wares with the 155 degs., as it certainly kes and has made a wrong impression, whilst true in the scientific or laboratory se it is certainly not true for the purposes everyday practice. We are great believers the efficiency of a well-make sprinkler, first-class sprinklers can verily stand on ir merits without such an addition as the degs. stamp.

We are glad that this test with the bion sprinkler has been made by the Comttee, which we observe supplemented its estigations by private tests with other proved types of sprinkler heads. The ort has opened the eyes of those working th these appliances. In individual cases ouldering fires have existed for a conlerable period, and done considerable mage before the sprinklers have gone off, where it is a question of smouldering es the difference of 30 to 40 degs. is a very portant matter. These hitches are now blicly explained.

We congratulate the owners of the Albion rinkler for having pluckily come forward independent investigation, after having ssed through the usual Fire Office test. We glad, too, to observe that the owners of is sprinkler do not stamp their appliances th the 155 degs. mark, so common in other rections.

We believe this is the first instance where rinklers have been independently tested d publicly reported upon in this country, d it will be well if the whole series of rinklers on the market were dealt with by Committee so that the advantages and sadvantages of individual makes would be sily ascertainable.

tomatic Sprinklers submitted for Test by the Albion Sprinkler Company, Ltd.

Object of Test.—To record the action of the bion automatic sprinkler head under nditions similar to those existing during tual fires, and also as to its stability under riations of pressure.

Notes as to Tests applied.

(1) Sprinkler heads subjected to a test with gard to sensitiveness and the falling away struts, levers and valve seats, on opening—st, with sprinkler head dry; secondly, th sprinkler head charged with water at temperature of the air under a pressure of lbs. per sq. in. (0·8 atmospheres).

(2) Sprinkler heads subject to a fire test in chamber 20ft. by 10ft. by 9ft. 6in. (6·1 by 5 by 2·9 m.) high from floor to underside joists with sprinklers charged with water der a pressure of 10lbs. per sq. in. (0·66 ms.) to ascertain—first, the time and temrature required to open; secondly, distrition of water. Each test applied to a rinkler head placed pendent under, and to sprinkler head inverted over the respective pply pipes.

(3) Sprinkler head subject to a test to show power to resist leakage or injury under dden variation of water pressure up to olbs. per sq. in. (33·33 atms.).

Summary of Results.

(1) *Sensitiveness.*—With heads inverted and bjected to a gradual rise of temperature sprinklers opened at a temperature of 4 degs. Fahr. (95·5 degs. C.) when wet, and at 208 degs. Fahr. (97·7 degs. C.) when dry, an average of 201 degs. Fahr. (93·8 degs. C.). With sprinkler heads pendent the average temperature at which they opened was 181 degs. Fahr. (82·7 degs. C.) dry and 190 degs. Fahr. (87·7 degs. C.) wet, the average of both dry and wet being 185 degs. Fahr. (85 degs. C.).

(2) *Sensitiveness and Water-distribution.*—With sprinklers subjected to a quick fire heat and charged at a pressure of 10lbs. (0·66 atms.), they opened when inverted at an average temperature of 209 degs. Fahr. (98·3 degs. C.) in 240 seconds, and when pendent at an average temperature of 219 degs. Fahr. (103·8 degs. C.) in 180 seconds.

Note.—This test with pendent sprinklers was influenced by warmth remaining in walls and pipes after the test with inverted sprinklers.

In each case on the opening of a sprinkler the parts fell clear away, leaving the discharge free. The water distribution under the minimum pressure of 10lbs. per sq. in. (0·66 atms.) is recorded in the body of report.

Note.—The water distribution was unfavourably influenced by the nearness of the sprinkler heads to the underside of the joists.

(3) *Stability.*—The sprinkler heads sustained varying pressures up to 500lbs. per sq. in. (33·3 atms.) without leaking or change that could be discovered.

The London Fire Brigade's Gongs.—The old method of signalling the approach of a fire-engine by shouting has at last been done away with, and in its place there will be the more modern contrivance of loud sounding gongs. The improvement is a small one, both as far as the size of the appliance and the expense is concerned, but it will have a far-reaching effect, inasmuch as the men will not arrive on the scene of the fire with their larynxes as susceptible to smoke and gases as if they had been shouting all the way to the scene of the fire.

HANOVER DISTRICT FIRE STATION.

THIS district fire station probably ranks as one of the most remarkable ones in Europe, it having been the first to be equipped entirely with self-propelled fire appliances, of which there are three in the engine-house, one being a motor steam fire-engine, one a motor chemical engine and the third a motor trap.

The building was originally erected as an ordinary fire station with horsed engines, but has since been adapted for its more modern purpose. Architecturally, it is typical of recent German municipal work, showing the half-timber work gables so common to certain districts in Northern Europe. Its internal arrangement is certainly the primary cause for our referring to this station, and thus it is to this part that we would call attention.

THE MOTOR FIRE-ENGINE STATION, HANOVER.

The principal feature of the ground floor is the engine-house, which is occupied by three motor vehicles. Directly behind this engine-house is the sleeping-room for the men on duty, in the form of a dormitory with sixteen beds. These men thus sleep within a few feet of the appliances which they man. There is further, on the ground floor adjoining the engine-house, a room for the three foremen on duty, each in charge of one of the vehicles in question. Further, there is a large lavatory-room with washing accommodation for the foremen and men on this floor, and lastly a small room with its window on to the thoroughfare, which serves as a watch-room and affords accommodation for the fireman who does station duty.

The first floor is occupied by a large day-room for the sixteen men on duty, and another large day-room for the three foremen, these rooms being connected with the engine-house below by means of the usual sliding poles. Besides this, there is a large rest-room or recreation-room, fitted with a billiard-table and games, which can be considered the men's private room, inasmuch as they have strict orders not in any way to disturb themselves on the entrance of a superior officer, *i.e.*, to go on with their games or their occupations as if the superior officer were non-existent when in this special room, whilst of course should they be in any other part and a superior officer passes they are expected to interrupt their conversation and practically be at attention.

On the first floor there is also the office of the superior officer, *i.e.*, district officer in charge of the station, who has some rooms on this level and additional ones on the second floor. He has his own staircase and side entrance as well as own sliding poles from both bedroom and office.

The station is wonderfully compact in its arrangement, and we know as a fact that the regular turning out time of this station averages about 16 seconds at night and about 20 seconds by day; the quicker time at night being due to the fact that the men sleep so close to the actual appliances, whilst there is of course no time wasted in putting horses to.

The district station turns out with one superior officer, three foremen and sixteen men on three appliances—the chemical engine leading the way, the trap coming second, and the steamer coming third. The first two appliances are electrically driven; the third travels under its own steam.

Besides being most remarkable as a compact and practical station of extraordinary efficiency and great average rapidity in turning out, this station has also the advantage of being a most economical one, and we have ascertained that as a matter of fact the saving on the three motor appliances in two years, as compared with the expenditure in the maintenance of the less efficient horsed fire station, was no less than £1,028, taking the mark as equivalent to 1s. Seeing that the purchase of the three self-propelled appliances cost the municipality £2,120, we find that the economy of two years' work on these three motor appliances, which turn out as an eminently efficient unit, has actually paid half the capital expenditure upon this equipment, which is certainly a remarkable feature in the annals of fire-service economy.

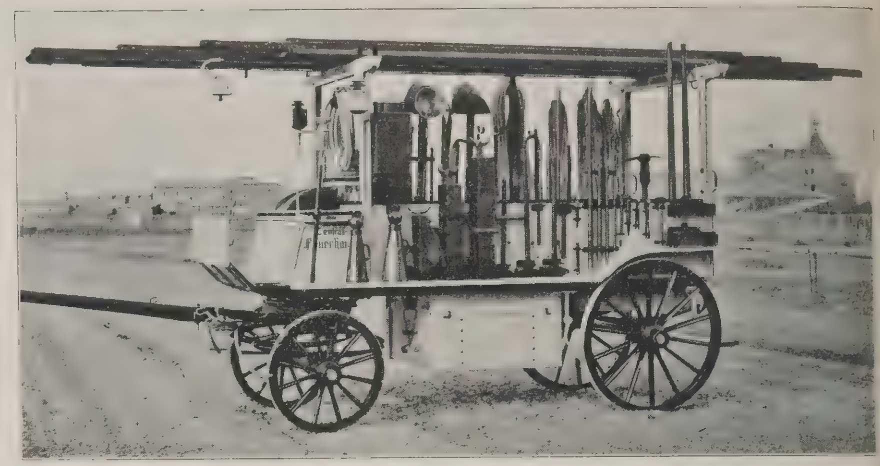
It is somewhat out of our sphere to go into detail regarding the economy and working of the appliances in question, which we had an opportunity to carefully investigate last month, but we certainly think that this little district station with its equipment stands so high in the annals of modern fire-brigade work that it well deserves illustration in these columns.

We also think it is only right to mention that the chief officer of the brigade at Hanover, of which this district station forms part, is Herr Reichel, formerly Inspector of the Berlin Royal Police Fire Brigade, of whom we recently announced his appointment to a chair at the Royal Technical College at Hanover, where his lectureship on fire protection is the first of its kind on the Continent of Europe.

A "DANGEROUS STRUCTURE" TRAP.

OF the various appliances seen by the members of the special commission who visited Munich last August, there was one vehicle which was of particular interest to the architects and surveyors of the party, This is the "dangerous structure" trap belonging to the professional fire brigade at Munich, the fire brigade in that city forming part of the general fire protective organization at the head of which is the chief surveyor of the city, who controls both the fire preventive and fire service side of his department.

In the same way as it was generally remarked by the members of that Commission what marvellous organization existed in some of the Continental centres for attending to the first-aid work in ambulance matters, so at Munich they found an excellent organization to deal with the question of dangerous structures.



A "DANGEROUS STRUCTURE" TRAP AT MUNICH.

Anyone who is acquainted with the usual practice of attending to dangerous structures in the Metropolis and in our provincial centres, will indeed comment on the advantages of having a dangerous structure squad organized on fire-brigade principles ready to turn out immediately at a moment's notice at fire-brigade pace and get to work with a number of useful appliances in a minimum of time. The men of this particular squad at Munich are, by-the-bye, firemen who have been scaffolders or artizans in the building trade.

The appliance we show is the one that turns out first, for there are other appliances such as a vehicle for carrying heavy balks of timber which can follow on when required. The appliance illustrated is, in other words, intended to afford that assistance the usual application of which is so often a question of seconds or minutes at the most and may save much life and value property.

The appliance stationed at headquarters is a horsed appliance of comparatively light build. It carries practically everything that can be wanted for first aid in respect to dangerous structures; thus it has an excellent supply of poles and tormentors: it has heavy pulleys, coils of heavy rope chains, axes, picks, crowbars, spades, saws, jacks of various descriptions, sledge-hammers, a searchlight, torches, temporary pedestal lights, a large supply of hooks, clamps, nails, screws, some short lengths of heavy boarding, some steel struts, &c. The men carried sit straddle leg down the centre of the trap on a bench. The trap has its own coachman and foreman who sits on the box. It makes its approach noticeable and clears the traffic by ringing a sharp bell which is worked by the foreman. On dark nights the trap, besides having its ordinary carriage lamps, has a torchlight to indicate its approach.

We consider this appliance, which was designed in accordance with the requirements of the local surveyor (Baurath Niedermayer), who acts as fire chief, and was built by Messrs. Weinhart, of Munich, to be one that well deserves the attention of the municipal authorities throughout the country.

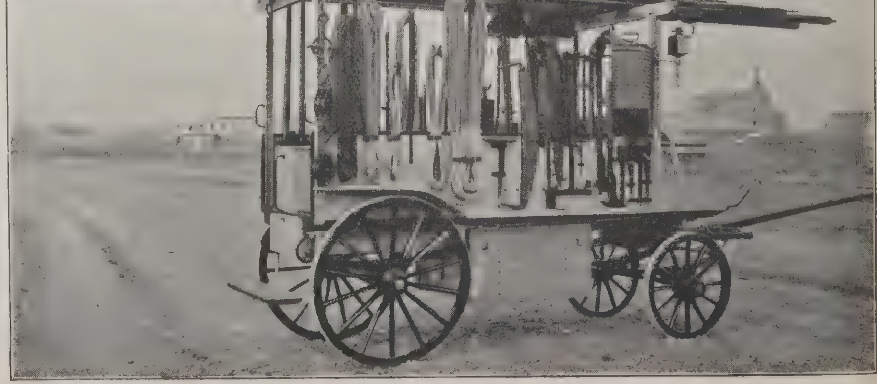
NOTICE.

PHOTOGRAPHS OF FIRES WANTED.

BOROUGH surveyors, insurance surveyors, fire-brigade officers and others are invited to send in photographs of fires for publication. Such photographs should comprise, if possible, a general view, but more particularly views of structural work and detail affected by fire. They should be accompanied by concise notes as to the fire as far as practicable. Communications should be marked "Fire Supplement" and addressed to the Editor, BUILDERS' JOURNAL 6, Great New Street, E.C.

Photographs of the following special subjects are particularly in request:—Iron doors armoured tin-clad doors, windows glazed with fire-resisting glazing, structural iron-work protected by concrete, terra-cotta o plaster. Floors of concrete, terra-cotta o plaster-slabs.

Photographs should not deal with fires earlier than January, 1903. Colonial and foreign photograph are equally welcome with British ones. Foreign photographs should be accompanied by particulars in either English, French or German, and no in any other language.



A "DANGEROUS STRUCTURE" TRAP AT MUNICH.

THE

BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD.

January 25, 1905. Vol. 21, No. 520. 6, Great New Street, Fetter Lane, E.C.

Summary.

The Soane Medallion has been won by Mr. S. Herbert Maw, the Pugin Studentship by Mr. E. Garratt, the Tite Prize by Mr. Robert Atkinson, and the Grissell Prize by Mr. James A. N. Hunter. (Page 49.)

Mr. Thomas Blashill, late superintending architect to the London County Council, died last Friday. (Page xiii.)

Opposition to the London Building Acts Amendment Bill is growing. The District Surveyors' Association has passed resolutions disapproving it. (Page 48.)

Trinity building, New York, now being erected, affords an excellent example of American steelwork construction and building organization. It will consist of twenty-one storeys and be more than 300ft. high. A characteristic feature in the operations is the manner in which material is brought on and taken away from the job: there is absolutely no room for the storage of materials, so that only the exact amount required each day can be delivered, while excavated material, together with all dirt and débris, must be cleared away at once. (Page 44.)

Good progress is being made with the King's Sanatorium at Midhurst, which is expected to be completed before the end of this year. (Page 52.)

An influential protest, headed by the president of the Royal Academy, is made to the London County Council against the proposed frontage line for the Strand improvement scheme, and the height of buildings already begun. (Page 52.)

A new outpatients' block to the Glasgow Western Infirmary has just been completed from Mr. Burnet's designs. (Page 48.)

Speaking at the annual dinner of the York Architectural Society last week, Mr. Butler Wilson said a draft Bill for architects' registration had been drawn up by the Institute committee and was now almost completed. (Page 48.)

The sending-in day for architectural works at the next Royal Academy Exhibition is March 24th. (Page 52.)

Wood poles for overhead tramway conductors are used in America, but they have a heavy appearance, and it is doubtful whether in the end they are cheaper than steel poles. Lattice-girder poles are said to be cheaper, but the painting necessary to preserve them from corrosion probably neutralizes the initial saving. (Page 51.)

Four important cases under the Workmen's Compensation Act were decided in the Court of Appeal last week. (Page 50.)

Verandahs are necessary around the walls of every habitable room, except those facing north, built in the plains of India. As regards the hills, there is no reason why buildings suited to an English climate should not serve their purpose equally well in India. (Page 49.)

"Dowsing." For some weeks past a controversy on the thorny question of "dowsing" has been going on in the columns of the "Times" which well merits attention. The attitude of our contemporary is one of incredulous disbelief; but in view of the testimony of several unimpeachable witnesses, deduced from personal observation of their own powers in the art of dowsing, backed by the supporting evidence of other trustworthy people who have witnessed these or other similar tests, the "Times" affects to believe that "half a dozen men of ordinary ability, powers of observation and common-sense could settle the whole question by putting half a dozen 'water finders' to the test." They might be able, but we doubt it. The difficulty would be to find six men sufficiently unprejudiced to record their observations and impressions in an impartial spirit. The mere subject of "water-finding" seems to raise a fire of fanaticism and intolerance that one could well wish limited to the regions of religious controversy. Not the least remarkable manifestation in this enquiry is the hostility of the pseudo-scientist. If there is one thing that this gentleman prides himself upon it is the possession or assumption of a healthy materialism that must necessarily, could he be brought to see it, prevent him from personally appreciating or experiencing those delicate physical phenomena to which "dowsing," if it has any scientific basis, belongs. The faculty of clairvoyance, of seeing visions, of personal magnetism, of all those manifestations which your pseudo-scientist lumps among the black arts, are admittedly of a nervous or neurotic type, a type that many may consider idiotic, childish or a nuisance, but which nevertheless exists and furnishes points of interesting study to all true scientific workers. The "dowsers" themselves admit that their power is entirely a psychological gift, which some possess in a greater degree than others. Necessarily therefore the efficacy of the power will vary, like all physical effects, according to the mental and physical condition of its possessor, and this may in part explain the non-success in some instances of "dowsers" who have previously been successful. But we doubt whether any percentage of successes less than 100 would satisfy your pseudo-scientist. He alone at the beginning of the twentieth century, when real scientific men stand at the borders of new worlds of psychical research, discounts all discovery by bald scepticism, and dismisses all unpalatable facts by the artless plea of coincidence. The controversy has brought out other interesting points—notably the gift many possess for wrangling over inessentials. As dowsers have worked with and without a twig it matters not how the twig is moved, whether consciously or sub-consciously; the point is, was water found? For the same reason the nature of the twig, whether hazel, willow or beech, is of little moment. These minutiæ may affect individual "dowsers"; but the main point is the psychical gift of the individual. The accredited successes of the "dowser" are frequently explained by the assumption that he was an expert geologist who relied on his knowledge for success, the dowsing being a "fake" for the benefit of the unwary. This is a futile argument. If it were so, it would pay the "dowser" to abandon the "no water, no pay" method, to set up as a geological expert and get his accounts passed by the Local Government Board, whether he found water or not. Our own attitude at present is entirely agnostical; we neither believe nor disbelieve. But the many authenticated successes of "dowsers," coupled with experiences of many people possessing "dowsing" powers, though not utilizing them for gain, should ensure an impartial investigation into the whole question. And if it were found that the matter resolved itself as one of the manifestations in certain individuals of the "N" or personal rays to which science has recently introduced us, we should not be surprised.

Four Appeal Cases. If there were not cases enough to substantiate the charge of ambiguity and faultiness of the Workmen's Compensation Act, the four that came before the Court of Appeal last week would amply supply any deficiency. Reports of these cases are given on pp. 50 and 51, but it is worth while here to point out what interpretations are possible under the Act. In one case it was argued that because a gantry was built of wood it was not a "building," and therefore the applicant was not entitled to compensation; in another it was shown that there was no provision in the Act that the scaffold must have been erected by the undertaker from whom compensation was claimed; in a third, concerning sewers, "engineering work" was held to include work done for the purpose of obtaining access to a sewer as well as the actual work of making an alteration in a sewer; while in the fourth case an extension to an electricity generating station was held to be a "building which exceeds 30ft. in height," though as a fact no part of the walls was more than 20ft. high. When so many interpretations can be put on the wording of the Act, the need for an absolute revision is apparent. Even judges are unable to understand it.

A NEW YORK SKYSCRAPER.

By E. KILBURN SCOTT, A.M.I.C.E.

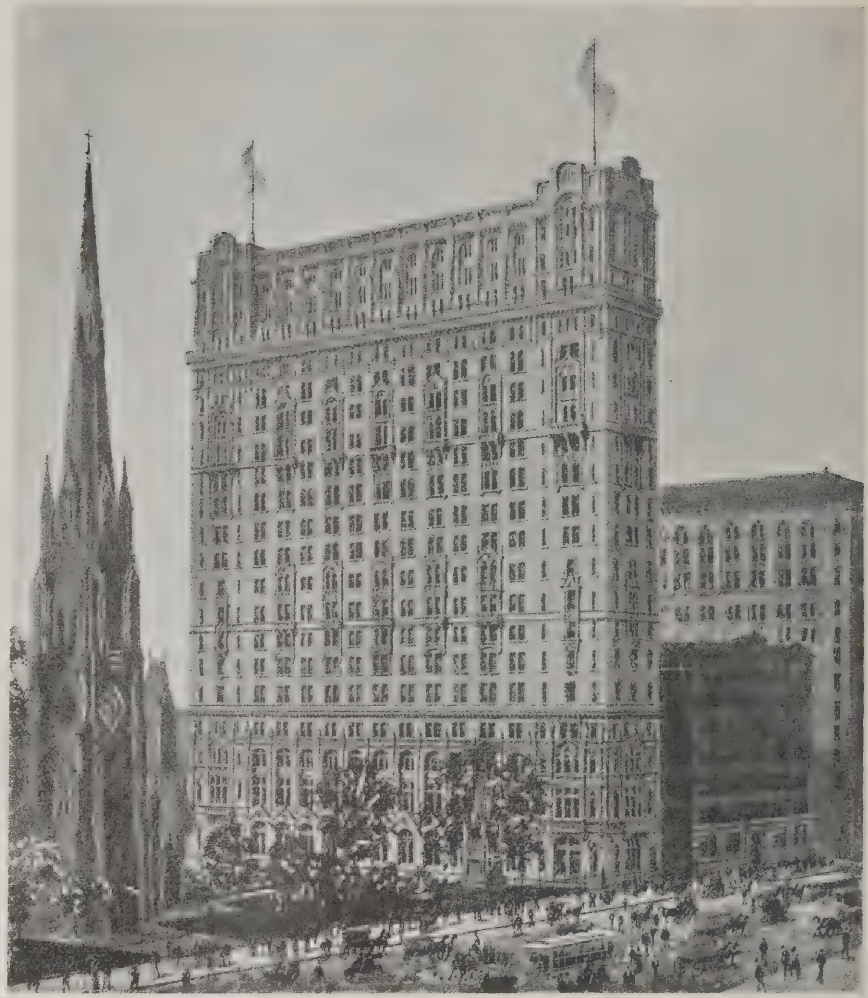
A FEW months ago the writer had an opportunity of going over Trinity building, New York, now in course of erection, and of taking photographs of some of the details. For this he is indebted to Mr. A. G. Ganson (of the G. J. Fuller Co., chief contractors), who superintended the erection of the famous Flat-iron building and during the last three years has built no fewer than four skyscrapers. Mr. Ganson is typical of many men who are in leading positions in the States in that he came out from the Old Country when a young man.

Site.

Trinity building stands on the north side of the well-known Trinity Church at the top of Wall Street. At one time the spire of this church was the most important landmark of New York, but now it is completely surrounded by skyscrapers, the view looking up Wall Street being the only one from which its beautiful proportions may be seen. This burying of church spires by buildings in which the pursuit of the almighty dollar is the only thought is typical of America; it certainly would not be tolerated in any other country. One result of it has been the introduction of a new and (the writer considers) degraded type of church architecture in which there is no tower or spire.

Size.

When completed the Trinity building will measure 240ft. along one side, 246ft. on the other, 41ft. along one end and 47ft. on the other. It will have twenty-one storeys and be over 300ft. high. At the time of the writer's visit (September last year) the fourteenth storey was in hand, but the twelfth storey was quite high enough to go crawling about a steel shell with only part of its flooring in.



TRINITY BUILDING, NEW YORK (AS IT WILL APPEAR WHEN COMPLETED, ADJOINING OLD TRINITY CHURCH). FRANK H. KIMBALL, ARCHITECT. S. C. WEISKOPFF, ENGINEER. GEORGE A. FULLER CO., BUILDERS.

TRINITY BUILDING, NEW YORK, SHOWING WALL ATTACHED TO STEELWORK.

Irregularity of Building.

It is interesting to note that every inch of space is taken advantage of, even although doing so means extra trouble and work in fitting the steel together. Thus it will be seen from the dimensions that not one of the four corners is a true right angle, and consequently the work of designing and setting-out the steel is more difficult than if the building had been an exact rectangle. Moreover, a building which is very narrow in proportion to its length and height has to be weighted to give stability, and this makes the design and building work more difficult. The Flat-iron building is a particular case of an exceptionally high building on a remarkably small base. It looks for all the world like a piece of cake which, by careful balancing, has been stuck up on edge.

Foundations.

Before removing the old building preliminary test borings were made by the jet process, and they indicated medium sand to 34ft., fine sand and quicksand to 74ft., and hard pan to 81ft., when rock was encountered. As ground-water level is 55ft. above the rock, and the fine and quicksand is unstable, it was necessary to build solid masonry foundations in pneumatic caissons and cofferdams.

The foundations for the centre rows of columns were sunk with cylindrical caissons, the cofferdams being of riveted steel construction. Along the two long sides of the building the caissons were rectangular, built of wood, with small clearances between so as to make a nearly continuous retaining wall.

All caissons and permanent cofferdams were filled with concrete, the upper surface on the rectangular piers being covered with single tiers of 20in. and 24in. I beams grouted in so as to distribute the pressure from the column pedestals to the concrete.

Speed of Caisson Work.

Work was commenced on March 10th, 1904; the first caisson was delivered on March 28th, and sinking with air-pressure commenced on March 30th. The maximum air-pressure was 27 lbs. per sq. in., and the maximum rate of sinking in sand about 1ft. per hour and in hard pan one-third of this rate. The fifty caissons were sunk in fifty-one days, from 300 to 500 tons of pig-iron being required for weighing them down. This pig-iron was removed from one to the other as required.

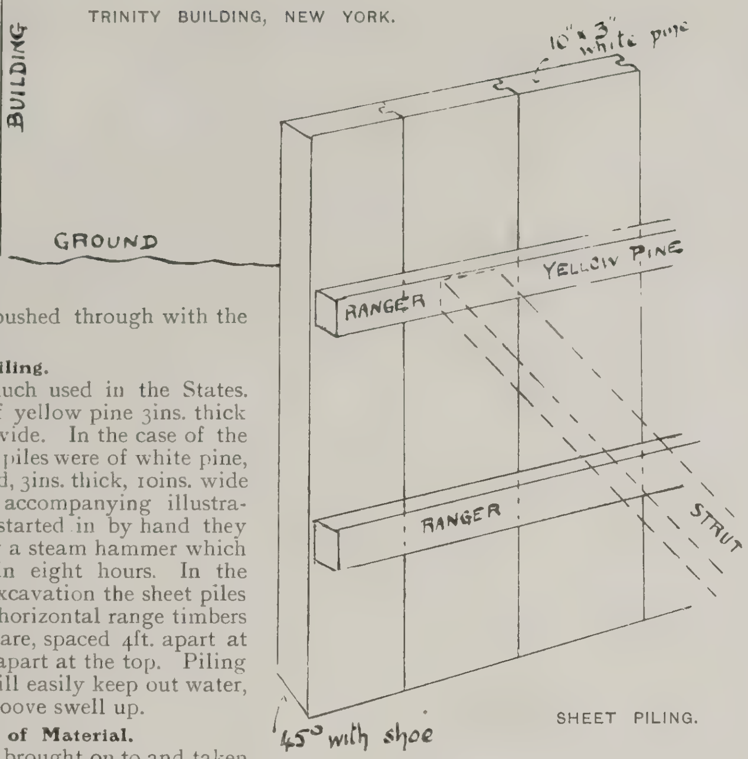
Speed of Excavation.

The entire building area was excavated in sand and gravel to a depth of 23½ft. below the level of Broadway, except at Trinity Place end, where it was 5ft. lower. The total amount of excavation, including old masonry and exclusive of the materials dug out of the caissons, was about 6,000 cub. yds., and this was removed by pick and shovel in thirty days by an average force of thirty men and twenty teams.

Convenience of Workmen considered.

As in all large contracts in the States, the convenience of the men has been considered, for the employers go on the principle that if they treat their employees well they will get a better class of men and the maximum amount of work out of them. For example, the "sand-hogs," as the men are called who do the sinking in the caissons, had dressing-rooms, hot-water baths and lounging-rooms provided for them. The foundation work was carried out continuously in three eight-hour shifts of 125 men, each including three five-men gangs of "sand-hogs."

TRINITY BUILDING, NEW YORK.



SHEET PILING.

The Trinity building has been delayed on account of the building trade strike in the New York district, but when in full operation between 800 and 900 men find employment on the work, and they represent all trades on the register. Wages are of course much higher than in England, so work has to be pushed through with the greatest expedition.

Piling.

Sheet piling is much used in the States. It usually consists of yellow pine 3ins. thick and 10ins. or 12ins. wide. In the case of the Trinity building the piles were of white pine, tongued and grooved, 3ins. thick, 10ins. wide and 22ft. long (see accompanying illustration). After being started in by hand they were followed up by a steam hammer which drove 150 lin. ft. in eight hours. In the deepest part of the excavation the sheet piles were braced by five horizontal range timbers 49ft. long, 12ins. square, spaced 4ft. apart at the bottom and 6ft. apart at the top. Piling put in in this way will easily keep out water, as the tongue and groove swell up.

Cartage of Material.

All the material is brought on to and taken away from the site *via* Trinity Place, as this is a less frequented street than Broadway. In getting out the excavations the carts went on an inclined roadway sloping down from Trinity Place, the soil of this roadway being afterwards shovelled into buckets and delivered by derricks to wagons at street level. At the present time the roadway runs in on the level from Trinity Place, at the side of the building, and is just wide enough for two carts to pass.

It may be mentioned that in the erection of these buildings the whole question of transporting the materials and men, &c., to and from the building site, and in proper sequence, is as carefully-thought-out as the details for an army corps. Seeing that as many as 1,000 men may be at work on the buildings, the importance of doing so is evident. There is no such thing as dumping a week's or a month's quota of material, as is possible under many English contracts.

Derricks.

There are two derrick towers, having each two 50ft. booms, and also four smaller derricks, all being so spaced that the entire area of the building is commanded. Steam for these derricks, as also for the air compressors, pumps, drills and other machinery, is purchased from the New York Steam Co. The engines for the derricks are in the basement and wire ropes run up from them. The derricks are moved up three storeys at a time, and are only used to lift steel and stone, all other material, such as bricks, cement, &c., being raised by temporary lifts fixed outside the building.

The latest practice in the States is to use electric motors entirely. For example, on the Wanamaker Stores building at Philadelphia the writer saw some exceedingly neat derricks and winches, &c., driven electrically. There is no doubt whatever that electric power is well fitted for this work, and the higher the building and greater the distance the more is its flexibility and economy made manifest.

Storage of Materials.

The whole essence of building skyscrapers lies in careful organization and the accurate figuring-out of the work from day to day. In a valuable part of the city, such as around Trinity Church, there is absolutely no room for the storage of materials, so that only the exact amount required each day can be delivered, and any materials excavated, together with all dirt and débris, &c., must be cleared away at once. When one considers that all the loading or carting involved has to be done through the crowded streets around Broadway and Wall Street in the face of exacting city regulations as to disturbance of traffic, it will be seen that the position of superintendent of a skyscraper building is no easy job.

Sub-Contractors.

In case of the failure of a sub-contractor to deliver his quota of the materials on any particular day, the main contractor goes out into the open market and buys whatever he can and at any price, and charges up the expense to the sub-contractor. There is a strict clause in the agreement that this may be done, and it is quite frequently enforced.

Speed of Building Steel Construction.

The speed at which the steel constructional work goes on is extraordinary. The Trinity building has made no records in this line because the whole building trade of New York has been disorganized for some time past by strikes, sometimes as many as 6,000 union men having been out, thus affecting about 20,000 hands.

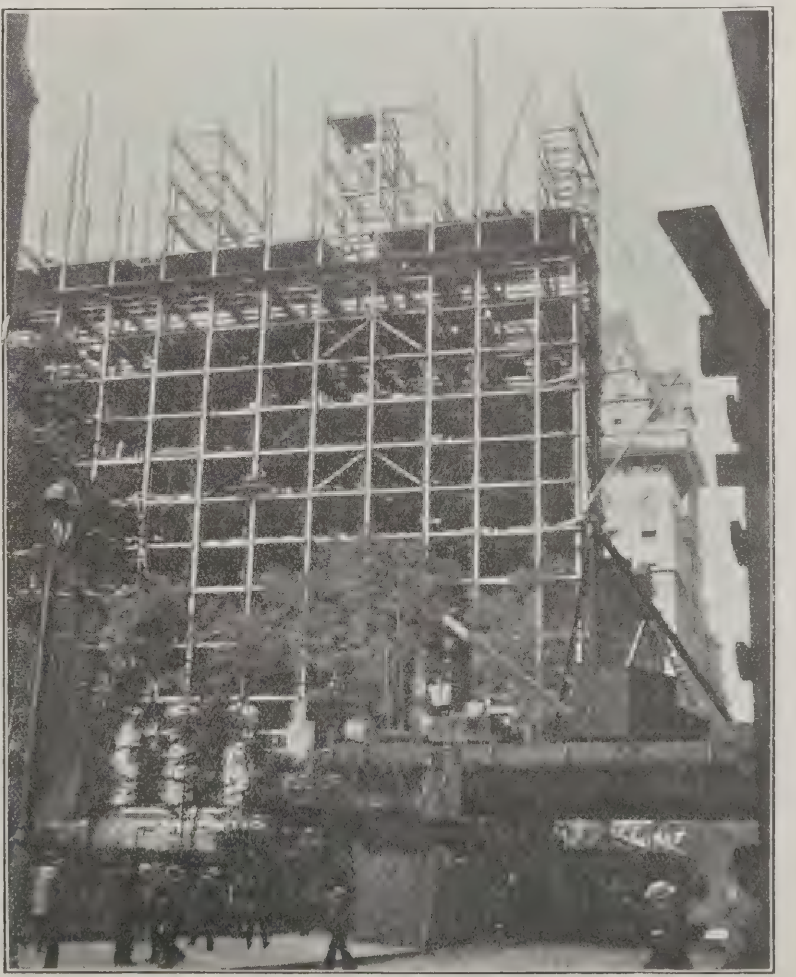
However, in the case of the Flat-iron building Mr. Ganson's records show that the whole of the steel construction from the side-walk up, including the masonry of the outside, was completed in three months. He expects to complete the steelwork of the Trinity building in 3½ months.

Columns.

The steel structure is carried on fifty steel columns arranged in three longitudinal rows, and the maximum assumed load on each column is about 1,000 tons. The magnificent simplicity of this steel construction is well shown by an examination of these main columns, for all that is necessary to give any requisite strength is to rivet on more and more 1in. thick plates to the standard section I beams, which go from the bottom to the top of the building.

Riveting.

The riveting is carried out by compressed air hammers something like caulking tools,

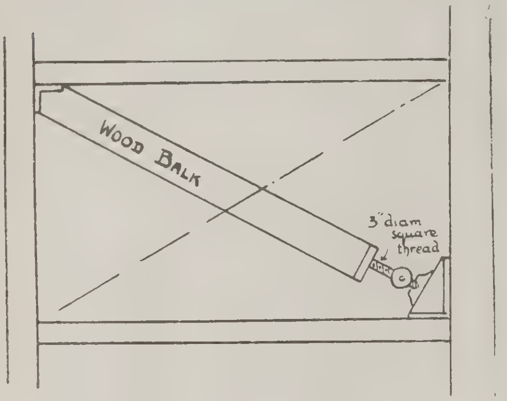


TRINITY BUILDING, NEW YORK, SHOWING SCAFFOLDING.

and about as noisy. Each hammer closes 300 to 350 rivets of $\frac{7}{8}$in. diameter per day of eight hours. Where electricity is employed for the derricks and winches, &c., there is no reason why electric riveters should not be employed. It would, however, be as simple to instal several electrically-driven air compressors at convenient points, in this way combining the advantages of electricity and air compression.

Bracing.

It will be easily seen that in carrying up a building twenty-one storeys high on a base averaging only 243ft. long by 43ft. wide great care must be taken to thoroughly brace the shell to withstand anything it may have to withstand in the way of wind-pressure.



TEMPORARY CROSS BRACING.

In the case of Trinity building these cross-braces consist of balks of timber 12ins. square set diagonally from the opposite corners of the main pillars. The ends are shod with iron and pointed. For tightening purposes a 3in. diameter square-thread screw is provided at the lower end, the head having capstan holes for the insertion of a crowbar. These braces are set alternately one way and the other right along the building so as to make everything quite rigid until the interior walling and framing is in position.

Flooring.

The flooring is built on what is known as the flat arch construction, and consists of blocks of terra-cotta having ventilating holes through. The ends are shaped at an angle and are set together in cement. There is supposed to be a slight camber, the drawing showing a couple of inches, but in the actual building the floor appeared to be constructed quite flat. In the photograph given below a workman is shown holding one of these terra-cotta blocks. Such is the strength of this flooring that on one occasion a derrick which fell through a floor was held up at the next. Occasionally coke-breeze concrete has been employed for the flooring, but terra - cotta is much better and safer, as in case of a fire the coke-breeze would undoubtedly burn; a plumber's fire has even been known to burn its way through such a floor. Its use in a building like the Savoy Hotel cannot therefore be too strongly condemned.

Concrete.

The concrete consists of 1 of best Leligh Portland cement, 3 of sharp sand and 4 of crushed limestone, broken to pass through a 1$\frac{1}{2}$in. screen. It was mixed on two mixing floors and handled into each caisson by two $\frac{1}{2}$-cubic-yard steel dumping buckets suspended from the upper edge, and arranged to hang plumb, even if eccentrically loaded. They pass through the air-lock in 60 seconds, and having special bottoms empty quickly and thoroughly.

View showing Steel Straps for fastening Masonry to Steel Framework.

Cement-mortar.

The cement-mortar for setting the masonry, brickwork and tilework, &c., consists of 1 of best Leligh Portland cement and 3 of sharp sand. It is delivered all ready mixed in bags from the factory, and only requires the addition of water. Owing to this, and the fact that all the stonework is worked up at the factory so that it exactly fits into its position, there is remarkably little dirt and dust about. Such as there is is got rid of by special dust chutes.

Masonry.

In September last the masonry of the second storey was being added. It consists of machine-shaped blocks of Indiana limestone, a material which cuts quite easily when newly quarried but acquires a hard surface after weathering. Each block of masonry is attached to the steel structure by a steel tie about 2ins. by $\frac{1}{2}$in., having its ends turned at right angles, one being bedded into the masonry block and the other riveted to the steelwork as shown above.

Laying Terra-cotta Fireproof Flooring.

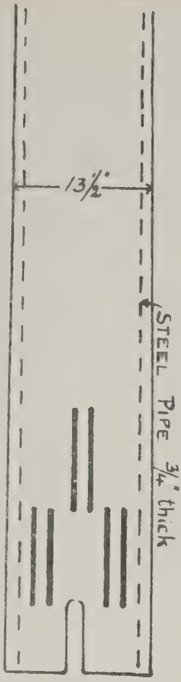
OF THE
UNIVERSITY OF ILLINOIS



STEEL DRILL FOR CUTTING HOLES FOR RAMS OF HYDRAULIC LIFTS.

Brickwork.

The brickwork at the bottom is 4½ft. through, and tapers off until at the top it is 2ft 4ins. It is lined inside with terra-cotta ventilated tiles 3ins. thick at the bottom and 2ins. thick at the top. These tiles are also used for dividing off the interior rooms. They are 6ins. and 4ins. thick, according to their position in the building. On the interior surface of the lower floors and walls there are damp-courses of bitumenized paper laid on with hot pitch and having a pitch covering.

Fireproof Staircase.

In order to carry out the fireproof character of the building in its entirety, the staircases are wholly of steel, with cement or granolithic treads. The staircase goes straight up from floor to floor, and is tiresomely like that of a lighthouse, but then, of course, it will not be much used.

Chimney.

The chimney runs alongside the staircase, and is built of steel plates. It measures about 5ft. by 2½ft., and is lagged with asbestos blocks measuring 18ins. by 4ins. by 2ins., set up edgeways, and held on with planished sheet-steel and steel bands.

Elevators.

Although the majority of the elevators in the States are worked electrically, yet one does occasionally come across a modern building fitted with hydraulic elevators. The proprietors of the Trinity building are apparently predisposed in favour of hydraulic, because when I was there drills were at work cutting the holes for the hydraulic rams. Six holes are being sunk through solid rock to a depth of 300ft. and three holes to a depth of 150ft. There will be eleven elevators altogether.

The drills work night and day without a break, and they consist of hard steel tubing of 13½ins. diameter and ¾in. thick. At the lower end of the tube the cutting edges are simply arranged by cutting two parallel slits at intervals. Each pair of slits is about 8ins. long, and as the tube wears away, first one pair of slits and then the other come into use, the piece of metal between the slits breaking out and so giving the required cutting edges.

Views and Reviews.

L.M.B.A. Diary and Handbook.

In the same form as before, the 1905 edition of this publication of the London Master-Builders' Association now reaches us. It gives particulars of wages, prices of timber, a glossary of electrical terms, the index to the London Building Act, a list of district surveyors, and various building memoranda and formulæ, all very handy in conjunction with a diary, though, as we have remarked before, there are other books that cover practically the same field.

"Diary and Handbook of the London Master-Builders' Association," edited and published by the Association, 31 and 32, Bedford Street, Strand, W.C., price 2s. 6d.

Portland Cement.

Among the many books which have been published on the subject of Portland cement, this, by the late Henry Faija, has deservedly been very popular. It only attempts to treat the subject in a very elementary manner, from the point of view of users, but that purpose it fulfils admirably, it being written very clearly and succinctly. Mr. D.B. Butler, who has revised and enlarged this fifth edition, has brought the book up to date, making alterations only where the original opinions were erroneous in the light of modern research. The chief new features are a revised form of specification, a chapter on adulteration, and a more modern series of analyses of raw materials, &c.

"Portland Cement for Users," by the late Henry Faija, revised by D. B. Butler, A.M.I.C.E., F.C.S., &c. London: Crosby Lockwood & Son, 7, Stationers' Hall Court, Ludgate Hill, E.C., price 2s.

Pocket-books for Electrical Engineers.

In the preface to both these new editions special emphasis is laid on the increasing sale of the books, which is not surprising when one remembers how extremely convenient these collections of formulæ, tables and condensed particulars are to working electrical engineers. Both pocket-books have been revised and enlarged again. They furnish particulars on every branch of the electrical engineering profession and present facts and figures in the concisest form. Fowler's year-book is quite the better (and the bigger) of the two, but the other will be found very useful, especially for its diary and "particulars for estimating for work" at the end of the book.

"Fowler's Electrical Engineer's Year-book and Directory of Light, Power and Traction Stations for 1905." Manchester: Scientific Publishing Co., 1s. 6d. nett. (post free, 1s. 9d).

"The Practical Electrician's Pocket-book for 1905," edited by H. T. Crewe, M.I.M.E. London: S. Rentell & Co., Ltd., 36, Maiden Lane, Strand, W.C., and Dawbarn & Ward, Ltd., 6, Farringdon Avenue, E.C., price 1s. 6d. nett.

New Edition of Fletcher's "Arbitrations."

A third edition of this book is now before us. It has been thoroughly revised and brought up to date by the inclusion of cases bearing on the several points, in addition to which considerable additions have been made to the various sections. The book is admirably produced.

"Arbitrations," by the late Prof. Banister Fletcher, Third edition, revised and largely rewritten by Banister F. Fletcher and H. Phillips Fletcher, FF.R.I.B.A., FF.R.S.I. London: B. T. Batsford, 94, High Holborn, W.C., price 5s. 6d.

Electric Lighting of Private Houses.

This was originally a series of articles in the "Model Engineer and Electrician," now collected together in book form, with the addition of a chapter on private generating plant: "and in this form it is hoped that the book may prove of service to those who, though not necessarily electrically trained, yet wish to gain an intelligent and accurate idea of good modern practice in the electric lighting of private houses." The particulars furnished have been given before in various forms, and the illustrations—as usual with this class of book—seem mostly to be taken from manufacturers' catalogues. There is nothing of particular interest to say in respect of the book, but the publishers doubtless know there is a market for it. Architects and builders, for instance, will find it handy, and as such we gladly draw attention to it.

"Private House Electric Lighting," by Frederic H. Taylor, A.M.I.C.E. London: Percival Marshall & Co., 26-29, Poppin's Court, Fleet Street, E.C., price 1s. nett.

Planning.

The second edition of this work is a considerable improvement on the first. It is, as we said in our review of the latter in our issue for April 10th, 1901, "memorabilia" rather than "principia," but it serves a very useful purpose. This edition has been considerably enlarged and plans added that bring the book more up to date and enlarge its scope. Whereas the first edition contained 80 plans, the present contains 150. The book collects into handy form many valuable data, and will be of great assistance to every practising architect. A new feature is a "tabulated list of useful memoranda," while there are six appendices, giving (1) section 80 of the London Building Act, 1894; (2) the L.C.C. theatre by-laws; (3 and 4) Board of Education codes for elementary and secondary schools; (5) L.C.C. by-laws under section 39 (1) of the Public Health (London) Act, 1891; and (6) extracts from ths Factory and Workshop Act, 1901.

"The Principles of Planning," by Percy L. Marks. London: B. T. Batsford, 94, High Holborn, W.C., price 8s. 6d. nett.

OUR PLATES.

FROM time to time we have given particulars—and latterly some illustrations—of new buildings in Cape Town, Johannesburg, Durban and other growing centres of business in South Africa. Through the courtesy of "The British and South African Export Gazette" we are now able to give a view of the new town hall and municipal buildings at Durban, which are to be proceeded with immediately, and when complete will be the finest block of public offices in South Africa. The scheme will cost £320,000, of which practically one-third will be covered by the £100,000 for which the Government has purchased the old town hall. This latter is to be used for postal and telegraphic purposes: the building was completed in 1885 at a cost of £50,000 and is of the Corinthian order of architecture with a clock tower 164ft. high. The architects of the new town hall and municipal buildings are Messrs. Scott, Woolocott & Hudson, of Johannesburg and London, whose design was selected in competition at the end of 1903. Since then, however, the plans have been considerably altered. Instead of a clock tower, such as was suggested in the original design, a dome has been adopted as the centre feature of the facade, and will face the new street which is to be cut through the Town Gardens. The corner towers with their small domes have been recast to harmonize with the centre feature, and the West Street front has been largely remodelled. Greater spaciousness has also been gained from the vestibule to the large hall, which is capable of accommodating 3,200 persons. In the basement is a lecture hall. The half basement, where the supper room, lecture hall, refreshment room, kitchen and other offices will be situated, will be easily accessible, special entrances to the rooms being provided from the main entrance hall. The library will be on the ground floor, the museum on the first floor and the art gallery on the second floor. The offices of the borough engineer, electrical engineer, borough surveyor and medical officer of health will be placed in the half basement, the town treasurer's and building inspector's departments being on the ground floor. Above these will come the rooms of the town clerk, town solicitor, and tramway department. The council chamber is close to the grand staircase hall. On the first and second floors cloak, retiring, refreshment and lavatory rooms will be provided, with ample accommodation at the rear of the orchestra on both floors. The galleries at the end of the large hall will be provided with ample exits and crush halls or foyers, and there will be sufficient promenade space on each floor to accommodate the whole of the occupants of each gallery in case of emergency.

The lodge at Pembury, Kent, has been erected from the designs of Messrs. C. E. Mallows & Grocock, of London and Bedford, and is an interesting example of country house design. The lodge to it was illustrated in our issue for August 10th last.

The United States Court House, Custom House and Post-Office at Wheeling, W. Va., is a fine example of the monumental Classic work now being carried out in America. The design, of course, is essentially French in feeling. The drawing itself is magnificent—far superior to anything that comes out of English drawing-offices.

COMPETITION REFORM SOCIETY.

THE third annual report of this Society for the year ending December 31st last (to be presented to the annual general meeting at 9, Conduit Street, W., to-morrow) states that increased evidence has been afforded of the wide-spread recognition of the Society's aims and usefulness.

It is worthy of note that out of the 67 cases of competitions considered in 1903, 17 were disapproved, while out of 70 dealt with in 1904 only 11 were considered unsatisfactory; so it would seem that a proper relation between competitors and promoters is becoming more general. Matters in connection with limited competitions have on several occasions been referred to the Committee, but the Society as at present constituted being limited to the field of open competition, action was taken only so far as the questions involved were matters of principle.

In April the Committee submitted to a special general meeting some proposed additions and alterations to the R.I.B.A.'s suggestions for the conduct of architectural competitions.

These proposed additions and alterations may be summarized as follows:—

A jury of three assessors should be appointed for all open competitions.

The functions and duties of assessors should be clearly defined in the conditions.

Conditions should be under the seal of the promoters in order to constitute a contract between them and the competitors.

The assessors, in addition to other duties, should approve the site; satisfy themselves as to the *bona fides* of the promoters' intentions to carry out the scheme; clearly define which of the conditions must be adhered to, and which may be followed or not at the competitor's discretion; and adjudge the competition solely upon information supplied. The assessor's award to be in writing and published verbatim immediately after the decision has been made.

Perspectives are generally unnecessary; if required, they should be prepared at the promoters' cost and under the assessor's direction, after the designs have been received.

Competitions should always be open when they are for public work undertaken with public moneys where the proposed expenditure is £10,000 or more.

The total amount of premiums should not be less than 1 per cent. of the assessor's estimate of cost, and should be paid in addition to the usual professional charges.

The deposit required for conditions should not exceed one guinea.

If work be not carried out within twelve months of selection, adequate compensation should be paid in accordance with the R.I.B.A. scale of charges.

If only part of the original design be carried out, payment should be made in respect of the deferred portion.

The assessors should be the sole judges of the fitness of the successful competitor to be employed.

An agreement should be entered into between the promoters and the successful architect, stating terms of engagement, &c.

A resolution was passed "that all the suggestions for the conduct of architectural competitions which may be adopted by the R.I.B.A. should be made rules to be compulsorily enforced upon promoters, assessors and competitors." Fifteen copies of the revised suggestions, and a copy of the resolution, were sent to the secretary of the Institute, with a request that he would place them before the R.I.B.A. Competitions Committee in order that they might be considered in conjunction with the Committee's own proposals, it having been ascertained that that Committee was about to revise the "Suggestions."

The following names have been added to the list of members (of London where not otherwise stated):—H. R. Appelbee, A. E. Corbett (Manchester), G. Fox, G. Hubbard, W. G. Hopkins, H. H. Langston, A. W. Moore, S. V. North, W. G. Payton (Birmingham), E. A. Robins, A. Saxon Snell, P. B. Tubbs, Butler Wilson (Leeds). The following members have resigned: Louis Ambler, R. Stephen Ayling, J. Langham, R. H. Morton, E. V. New, A. J. Penty.

At the annual general meeting held on February 5th, 1904, a motion stood upon the agenda that the annual subscription should be raised to 10s. 6d., but in view of the many letters which had been received objecting to the proposal, the motion was withdrawn and an amendment agreed to inviting members to subscribe, in addition to their annual subscription, a further sum of 5s. towards paying off the deficit of the Society. Thirty-seven members responded to the appeal. The accounts now show a balance of about £10 to the good.

YORK ARCHITECTURAL SOCIETY.

AT the annual dinner of the York Architectural Society held last week, the president, Mr. Herbert Davis, F.R.I.B.A., of Scarborough, said that architecture was not, and never could be, placed on the same plane as the arts of sculpture and painting, because the architect was too much fettered by the conditions under which he had to work to be called an artist pure and simple. Speaking of illicit commissions he said that these only really existed among the small class of men whom one would scorn to call members of the profession. The reason of accusations of illicit commissions being received by architects was that so many architects were such bad business men that the mistakes made by them gave rise in the minds of their clients to the thought that their interests from a business point of view were not being attended to, or that the laxity and indifference that was shown had some other underhand explanation. Mr. Arthur Pollard, in proposing the toast of the Royal Institute of British Architects, referred to the memorial issued by the Institute in regard to important architectural work being carried out by borough surveyors, 75 per cent. of whom, he said, were not equal to the task. He spoke in favour of registration. Touching on the same matter, Mr. Butler Wilson said the Institute Committee appointed in June last year had held many meetings and a draft Bill was now almost completed.

NEW OUTPATIENTS' DEPARTMENT AT GLASGOW WESTERN INFIRMARY.

THE new buildings for outpatients at the Glasgow Western Infirmary were opened on Wednesday last. They are situated to the west of the main infirmary block and form part of a scheme for the extension of the infirmary to the west, which is urgently needed. The new patients' waiting-room is 26ft. by 16ft. and is in communication with a diagnosis room for the examination and classification of cases.

The general waiting hall, 86ft. by 31ft., is seated for over 400 persons, and out of it leads a corridor eastward to the main operating theatre, which is 30ft. by 29ft., with gallery accommodation for sixty students.

Small lobbies lead off the waiting hall to five medical and surgical consulting rooms, with their necessary dressing-rooms; each consulting room is 24ft. by 24ft., with gallery accommodation for fifty students, the lighting (as in the operating theatre) being from the north. At the west end the communication corridor leads into the ear, nose and throat rooms. From each of the consulting rooms doors lead to the exit corridor, which runs along the entire north and west walls of the building and ends in the dispensary waiting hall. This hall (30ft. by 19ft.) is seated for seventy persons, and has two hatches into the dispensing-room (30ft. by 30ft.).

The heating of the buildings is by low-pressure hot water on the Reck patent system, the circulating water being warmed by steam, which is taken from the main boilers of the institution. The steam is led into a heating chamber in the basement of the dispensary, where it is reduced to a low pressure before being applied to the heating system. There are 115 radiators in the various rooms, representing 6,200 sq. ft. of heating surface, or 1,000,000 British thermal units per hour.

Ventilation is effected by four extract electric fans, the incoming fresh air being introduced into ducts through copper gauze screens, passing afterwards through registers fixed in the walls immediately behind the radiators, and about 6ins. above the floor: the extract registers being in the ceilings and connected to shafts in the roof leading to the fans. The apparatus is capable of maintaining a temperature of 60 degs. Fahr. in the rooms and in the waiting hall when the temperature of the outer air is 25 degs. Fahr. The fans are able to change the air in the rooms six times an hour and in the large waiting hall ten times an hour.

The building has been erected from the designs of Mr. John James Burnet, A.R.S.A., and the lighting and heating have been carried out under the direction of Mr. Thomas Young.

THE LONDON BUILDING ACTS AMENDMENT BILL.

OPPOSITION to the London Building Acts Amendment Bill (which is stated to have passed the examiners of private Bills) is gathering strength, says the "City Press." The uncompromising hostility of the Corporation is assured, the Duke of Westminster is said to be opposing the measure on his own account, and the Property Owners' Association (which represents two-thirds of the ratable value of the City) will also oppose it. The Kensington Borough Council has passed a resolution suggesting a conference of the local authorities on the subject, to consider what joint action shall be taken in respect to the Bill, and the District Surveyors' Association has passed resolutions that whereas the London Building Act, 1894, comprises about 700 clauses and four schedules of fourteen pages, and it is now proposed to add to this and the amending Act of 1898 a further Bill of nearly 400 clauses (and two schedules), the majority of which have to be read into the sections of the first-named Act, this Association, without reference to the merits of the proposals, submits that such a measure will be absolutely unworkable, that it will be almost impossible to grasp its provisions, and that such a combination, uncertain in its meaning and complicated as it will be, must inevitably lead to constant litigation. They further submit that the only satisfactory course in order to accomplish an amendment of the magnitude contemplated is to embody them in a new Bill to supersede the present Acts, which should only be brought before Parliament after careful consideration by the various authorities and professional societies interested therein. They further submit that many of the powers proposed to be taken by the L.C.C. are to a considerable extent such as should in the public interest be the subject of specific rules to be enacted by Parliament, and be administered by the district surveyors, who should be persons qualified by education and experience for that office. The constant reference to the Council will also cause uncertainty, great delay and expense to the public.

London's new Reservoir.—The latest addition to the water service of London is a new circulating reservoir at Sundridge Park, Bickley. On plan it is like a circular maze, its object being to ensure the constant movement of the $1\frac{1}{2}$ million gallons of water which it contains. Owing to the numerous circular channels through which it has to pass, the water makes a journey of half a mile before reaching the outlet in the centre. The reservoir was designed by Mr. William Morris.

Prizes and Studentships; European Architecture in India.

A MEETING of the Royal Institute of British Architects was held at 9, Con- it Street, W., on Monday evening, the iir being occupied by Mr. T. E. Collcutt. Mr. Graham, hon. secretary, referred to e death of Mr. Thomas Blashill in feeling ms, and a vote of condolence with the atives was passed, Mr. William Woodward d Mr. E. W. Hudson also testifying to the gh ability of the deceased.

The deed of awards of prizes and student- ips for 1904-5 was announced as follows:—

Silver Medal and 25 Guineas for an essay the development of architectural art from uctural requirements and nature of aterials (14 competitors):—Miss Ethel M. iarles, A.R.I.B.A., of London ("Dil Aram"). ie sum of 10 guineas and a certificate of n. mention was also awarded to Mr. A. omney Green ("Beauty is Truth, Truth auty"), and certificates of hon. mention ere also given to Messrs. J. Jeffrey Waddell Brunelleschi"), J. Murray Kendall Hawk"), Leslie Patrick Abercrombie I Bide My Time"), Walter H. Godfrey Nike Apteros"), Cyril E. Power ("S. lmund, King and Martyr"), and Hugh P. Maule ("Ubique").

Silver Medal and 10 Guineas for measured awings (17 competitors):—Mr. Edward G. ylie, of Glasgow ("Unicus"), for 6 strainers Haddon Hall, Derbyshire. Certificates of on. mention were awarded to Mr. W. Harold illyer ("Thames") for 5 strainers of Somer- t House, and to Mr. Arthur R. H. Jackson evice of a "Red Disk") for 6 strainers of e Pazzi Chapel, Santa Croce, Florence.

Soane Medallion and £100 (for Continental ivel) for the design of a royal palace (12 mpetitors):—Mr. S. Herbert Maw, of Bol- n, Lancs ("Crumpets"). Certificates of hon. ention were awarded to Mr. Robert White ckering ("Benedick") and Mr. W. A. S. ordon (device of a "Lion Rampart").

Owen Jones Studentship (certificate and oo) for travel and study of colour (three mpetitors):—Mr. Harry Morley.

Pugin Studentship (silver medal and £40) r travel in the United Kingdom (seven mpetitors): - Mr. E. Garratt. The sum of guineas and a certificate of hon. mention as awarded to Mr. H. A. Dalrymple.

Godwin Bursary (silver medal and £65) r travel outside the United Kingdom:— r. F. R. Hiorns (the only competitor).

Tite Prize (certificate and £30)—for travel Italy—for the design of an hotel lounge d staircase:—Mr. Robert Atkinson, of ottingham ("Palladio"). The sum of 5 iineas and a certificate of hon. mention to r. Alec. G. Horsnell ("E Angle") and a rtificate of hon. mention to Mr. C. L. right ("Vista").

Arthur Cates Prize (£42)—two competi- rs—Mr. F. Winter Newman. A certificate hon. mention was awarded Mr. Vincent ooper.

Grissell Gold Medal and 10 Guineas (for sign and construction) for the design of a inter garden in iron and glass (five com- titors):—Mr. James A. N. Hunter, of berdeen ("Onward").

Ashpitel Prize of books value £10, given the candidate who passes best in the aminations, was awarded to Mr. C. Lovett ill, of London.

A paper on "European Architecture in lia," illustrated with lantern views, was en read by Mr. James Ransome, F.R.I.B.A., nsulting architect to Government, Calcutta.

Referring to the tendency in recent years India to erect buildings in the styles and on the lines of those found to be suitable in England, Mr. Ransome said he proposed to demonstrate the obstacles which opposed this practice. For although the dearth of good European buildings was undoubtedly largely due to the lack of proper architectural training in their designers, it was at least open to debate whether this deficiency might not be, in an even greater measure, the result of an insistence upon European traditions in the face of climatic opposition.

Except where earthquakes are of frequent occurrence, and in the case of buildings erected immediately after such disturbances, the possibility of their occurrence does not appear to have influenced the construction or designs of buildings; on the contrary, there seems to be a feeling that even the smaller buildings are incomplete without a tower, dome, minaret or turret. Cyclones affect construction rather than design, while dust-storms render it advisable that all apertures ordinarily left open may be closed on occasions. In many districts the prevalence of flies necessitates the addition of gauze shutters to every opening.

A really watertight roof is an unusual luxury in India, and as failure in this respect is attributed to the severity of the rains rather than the inefficiency of the roofs, but little effort has been made towards their improvement. Latterly pitched roofs have come increasingly into use, and though contrary to the traditions of the country, seem likely to survive the prejudices against them. It is something of a surprise to find that sheet-iron, either corrugated or plain, is largely used for roof-coverings in India, since it offers but little resistance to the outside temperature, is very noisy and rarely watertight during the rains, requires constant attention, has no lasting properties, and is always unsightly.

In a country where buildings are rarely to be seen except beneath a brilliant and cloudless sky, the influence of cast shadows calls for greater consideration than in places blessed with less sunshine; hence much of the European work in India appears at its best only on the comparatively rare occasions when the sky is clouded. The native work is often richly inlaid with marbles, stones and tiles, and when carving is employed externally it is usually in low relief. For the most part Indian bricks are of most excellent colour and quality, and susceptible of sufficiently fine treatment. The bricks are rubbed so that their joints are hardly perceptible, and the whole of the face is finely carved. Such work is abundant in many of the native cities, and is still being executed.

Dealing with the temperature of India so far as it affects building designs, the author classified the climate under three headings, viz., that of the Hills, that of the Plains and that of the Coast, describing typical cases of each to convey an idea of the general conditions. The temperature of the Hills tallies so nearly with what we are accustomed to in this country that, so far as heat and cold are concerned, there is no reason why buildings suited to an English climate should not serve their purpose equally well if transplanted to the hills of India.

While the temperature of the Coast may be considered as uniformly hot, that of the Plains, though rising many degrees higher during the hottest days, falls considerably at night, and is some 30 degrees cooler in winter than in summer. Hence it is customary in the Plains to close all apertures and exclude the outside air during the hot days, while around the Coast windows and doors are thrown open all the year round and the windows are frequently left unglazed. In the older buildings these opposite conditions produced a marked difference in the plans of buildings for the Plains and those for the Coast; for whereas the former were, as a rule, compact, with lofty rooms grouped around a large central apartment usually unlit by windows, the plans of buildings for the Coast were extended and arranged so that the rooms had as many outside walls as possible. In the more modern buildings this difference is less marked, for on the one hand the introduction of cooling by evaporation has opened out the plans of buildings for the Plains, while increased cost of building has curtailed the area of those for the Coast. As a rule, however, the older arrangements were more satisfactory, and it is not desirable that the conditions which gave rise to them should be overlooked.

But whether on the coast or inland the comfort of buildings in the plains of India is chiefly dependent upon the extent to which their walls are protected from the rays of the sun. Many of the European buildings are now built without verandahs; but as their omission entails great discomfort, and ultimately results in the disfigurement of the building by various devices for protecting it from the sun, there can be no question as to the necessity for verandahs around the external walls of every habitable room except those facing north. It follows, therefore, that the appearance of an Indian building must necessarily be largely dependent upon the treatment given to its verandahs, and one of the chief difficulties in this connection is that of exposing a sufficient feeling of solidity in a building of which so large a proportion of its main walls must be concealed.

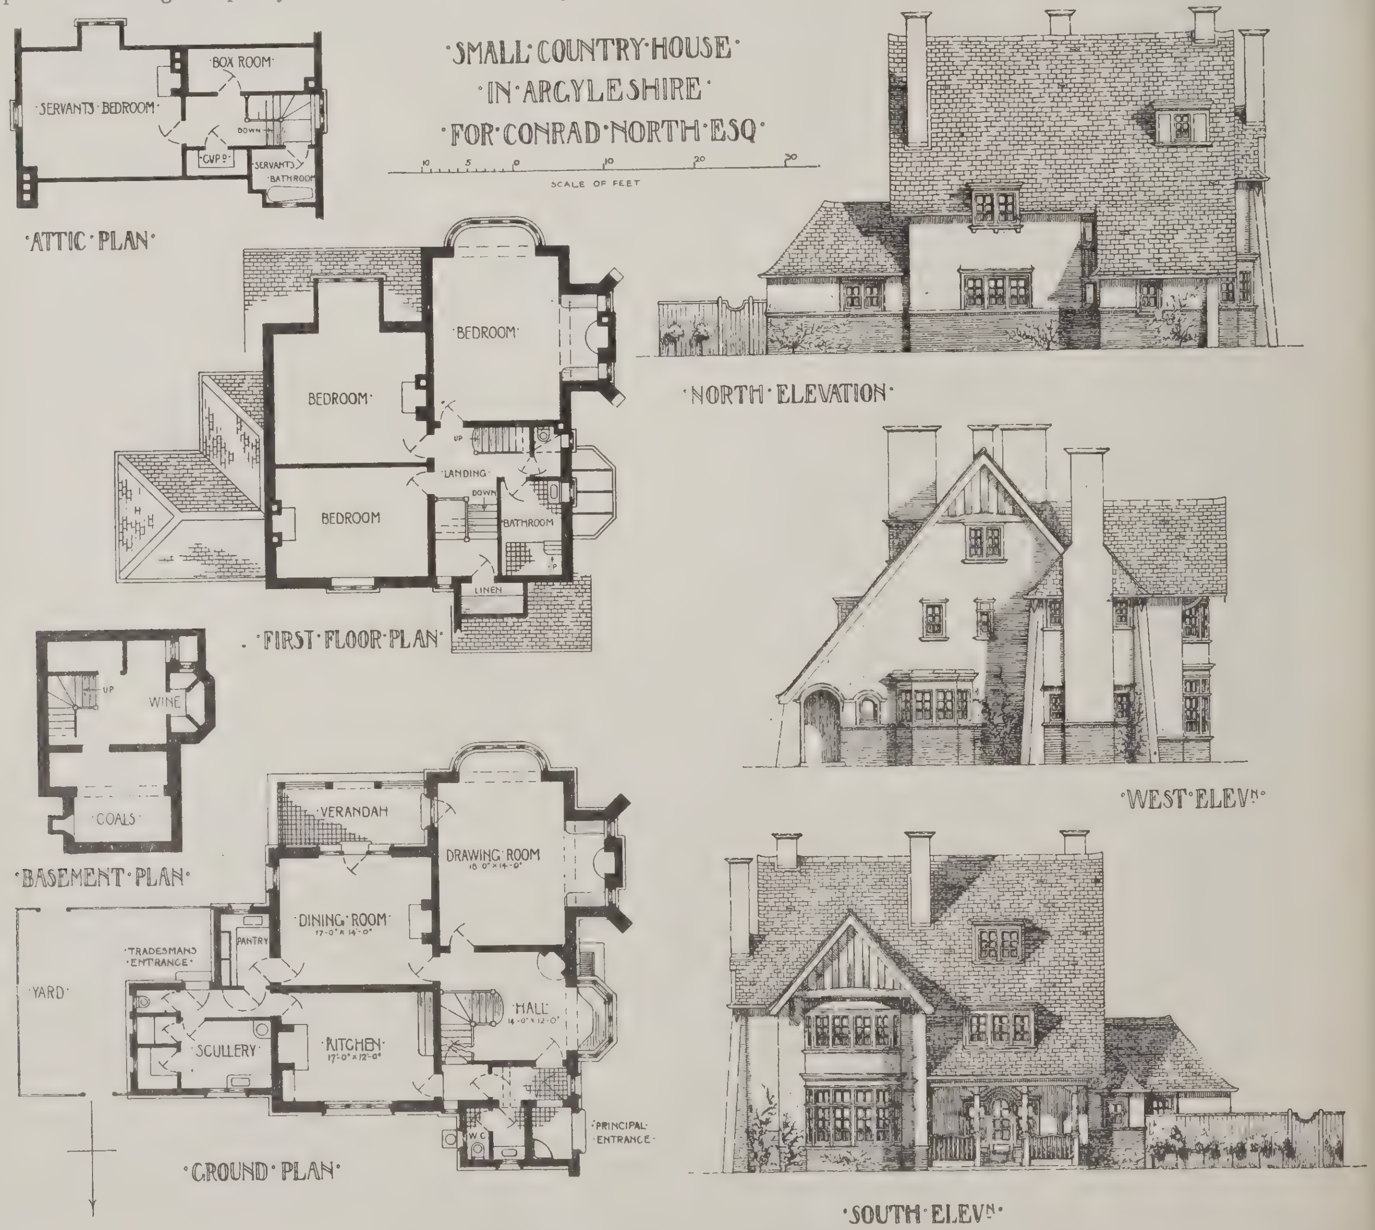
In many of the modern designs for buildings attempts are made to follow the lines of native Indian architecture; as a rule, however, not with very satisfactory results, as they are based upon a too perfunctory study of native work.

Indian architecture may be broadly classified under two heads—Hindu and Saracenic. Instances of satisfactory structural forms are rarely to be met with in Hindu work, which seems never to have shaken itself free of the timber and rock-cut traditions upon which it was based. Yet much of this work is covered with beautiful detail and refined and graceful ornament.

It is strange that such a monument to the power of simplicity as the Taj Mahal should stand in a country so much in need of the lesson it should teach, and the fact that its influence upon the architecture of the country is imperceptible is perhaps even more surprising. Much of its effect is undoubtedly due to the increased play of light and shade, induced by its walls meeting at obtuse angles a form of treatment which might be applied more generally to the walls of verandahs without detriment to their utility, and with some advantage to their appearance; for the excessive accentuation of right angles, produced by the brilliant sunlight of the plains, is not always beneficial to the appearance of a building. A dome is not ordinarily an economic form of roof, and it is not easy to find any useful employment for minarets and the little domed structures with which the roofs of Saracenic buildings are usually decorated, and which play so large a part in their composition. Nor is there much need in European buildings for the finely-pierced stone tracery which was extensively used in the windows and balconies of this style; or for those curious and typical features known as Jhomkes, examples of which are to be found on the gateway of the Taj. On the other hand, the Chujja, or wide projecting slab cornice, which is one of the most characteristic features of Saracenic work, is exactly what is required to shelter clearstory windows and exposed walls. The Kingras, or ornamented battlements, many of which are of very beautiful design, can be introduced effectively in place of the European parapet, while the great variety of form in the Saracenic arches affords sufficient scope for judicions selection. The style is also rich in oriels and balconies, designed in admirable taste and executed with considerable skill.

Law Cases.

Four Workmen's Compensation Appeal Cases.—In the Court of Appeal last week decisions were given in the four workmen's compensation cases of *Aylward* v. *Matthews*, *Fletcher* v. *Hawley*, *Coles* v. *Anderson* and *Hartley* v. *Quick*. The first was an appeal by the employer from an award made by Judge Emden at Lambeth. The applicant for compensation was a labourer employed by Matthews in the erection of a timber gantry supporting a steam crane platform at Salter's Hill Board School extension. On the day of the accident he was working on one of the legs of the gantry (which was then 62ft. high, but the steam engine had not been placed on the platform) and when descending a ladder inside the leg a plank broke on which the ladder stood and he fell and was injured. The school building at the time was not 30ft. in height, the foundations only having been laid. Judge Emden found that the steam crane gantry was a "building" within section 7, sub-section 1, of the Workmen's Compensation Act, 1897, exceeding 30ft. in height; that it was being erected by means of a scaffolding, which was an essential and substantial part of the process of the work; and that Matthews was the undertaker in respect thereof. He accordingly awarded a weekly sum as compensation during incapacity. Matthews appealed. The Court, however, dismissed the appeal. The Master of the Rolls said that the ground of this appeal was that the county-court judge had wrongly found as a fact that a certain wooden structure, which was itself being constructed by means of a scaffolding, was a "building" within the Workmen's Compensation Act, 1897. How could they say as a matter of law that a temporary wooden structure erected for the purpose of carrying a crane was not a "building"? Suppose that a permanent structure were built of brick or stone for the purpose of carrying a crane, it could not be said that it was not a "building" within the Act. The only difference between the two structures was that one was constructed of wood and the other of brick or stone. In his opinion it could not be said as a matter of law that because the structure was made of wood it was not a building. The structure here was capable of being a "building" and the appeal accordingly failed. Lord Justice Mathew was of the same opinion. The argument on behalf of the appellant pointed to this, that a structure to come within the word "building" in the Act must be made of brick or stone. The Act did not, in his opinion, contemplate any such limitation upon the meaning of the word. The structure seemed to him to be the same whether it was constructed of wood or of brick or stone, and it might be a "building" within the Act though only a temporary wooden structure. Lord Justice Cozens-Hardy agreed.—The second case was that of *Fletcher* v. *Hawley*. This was an appeal by the workman, Fletcher, a carpenter, against a decision of Judge Raikes at Barnsley. The facts were as follows:—A shop was being altered into a restaurant. The building owner entered into an agreement with Hawley, a master carpenter, to put up a screen in the shop, and to do other work which did not require any scaffolding. He also contracted with a builder to have a fireplace put in one of the rooms and a new chimney built, which did require scaffolding. While Fletcher was punching a nail into the screen, part of the punch flew off into his eye, and caused very serious injury. The county-court judge held that as the Act only applied to buildings being repaired by means of a scaffold, Hawley was not an undertaker within the Act, because for his job no scaffolding was necessary and the workman could not claim compensation from him. He, therefore, refused to make an award in his favour. The workman appealed. The Court allowed the appeal. The Master of the Rolls said it appeared that Fletcher availed himself of the builder's scaffolding to a certain extent. The county-court judge held that, in order that the injured workman might recover compensation, it was necessary that the scaffolding should have been put up



EWART G. WALKER, ARCHITECT.

In this design an endeavour has been made to introduce conveniences in accommodation usually associated only with much larger houses. The exterior walls above the ground-floor window-sills are rendered with coarse rough-cast of granite chips, lime-whitened, being faced below the sills with special warm-coloured red bricks. The roofs are tiled and all external woodwork is painted green. The verandah, vestibule and ground-floor lavatory are paved with red paving quarries. The sunk bath on the first floor is constructed of steel joists and concrete, and is lined with white glazed tiles.

by the undertaker from whom compensation was claimed. At first sight it might appear that there was something to be said in favour of this view. But it had been expressly decided that there might be more than one undertaker to the same building, and when that was once accepted it seemed to him that the whole position contended for by the applicant was carried. The Act required that there should be a scaffolding by means of which the building was being repaired, but there was no provision that the scaffolding should have been put up by the undertaker from whom compensation was claimed. The existence of a scaffolding was necessary, but if there were more than one undertaker it was not necessary that the scaffolding should have been put up by the undertaker in whose employment the injured workman was. The fact that the injured man made some use of the scaffolding seemed to put this case on all-fours with *Mason* v. *A. R. Dean, Ltd.* The appeal was therefore allowed, and the applicant held to be entitled to an award of compensation. The Lords Justices delivered judgment to the same effect. - The third case, that of *Coles* v. *Anderson*, was an appeal from an award of the judge of the Shoreditch County Court in an arbitration under the Act. The facts were as follows:—A private owner had built a house and had made a drain for it, which required to be connected with the main sewer. The local authority had, in the interests of the public, entered into an arrangement by which the work of connecting the drains of private houses with the main sewer should be carried out by their contractor. The owner had brought the drain up to the edge of the footway in front of his house—that was to say, to the point where the work of the local authority's contractor was to begin. The deceased workman was in the employment of the contractor, and at the time of the accident he was engaged in making a trench in which a pipe was to be laid by which the private drain was to have access to the public sewer. The trench had not then reached the sewer, nor had the sewer been touched, but the object of making the trench was to connect the drain with the sewer. The county-court judge held that, as a matter of law, the employment on which the deceased was engaged was not on or in or about engineering work. (The Act, by sub-section 2 of section 7, defines "engineering work" as being "any work of construction or alteration or repair of" *(inter alia)* "a sewer." And it also, by sub-section 1 of the same section, enacts that its provisions should apply to "employment on or in or about engineering work.") The county-court judge made an award in favour of the respondent, with costs; but he ordered a stay of execution pending an appeal. The Court allowed the appeal. The Master of the Rolls said in his opinion "engineering" work included work done for the purpose of obtaining access to the sewer as well as the actual work of making the alteration in the sewer. The county-court judge divided the work into two parts; he separated the work of obtaining access to the sewer from the work of actually altering the sewer. But all the work had for its object the connecting of the private drain with the public sewer. In his opinion the county-court judge had misdirected himself by narrowing the meaning of engineering work and by not including in it the antecedent ancillary work which was necessary for performing the actual work of alteration. The Lords Justices delivered judgment to the same effect.—The fourth case was that of *Hartley* v. *Quick.* This was an appeal by the employer from an award made by Judge Gye at Portsmouth. The applicant for compensation was a workman in the employment of Quick, who was a builder and contractor engaged in erecting an extension to the corporation electricity generating station at Portsmouth. The workman was injured by falling off the scaffold while carrying up materials. At the time of the accident the walls of the new building had been carried up in places to about 20ft., but they were not anywhere connected with the station, though the footings for the extension were in absolute touch with the wall of the existing building. The county-court judge said the question seemed to be—under what circumstances could a building less than 30ft. high adjoining a building more than 30ft. high be a "building which exceeds 30ft. in height"? In his opinion, if the two buildings were intended ultimately to form one building, or to form two buildings to both of which an existing party or other wall either was or was intended to be common, absolute physical attachment of the new to the old building was not necessary so long as the building operations were being carried on in connection with and having regard to both buildings. He accordingly held that the applicant's employment came within the Act, and he awarded him 12s. 6d. a week. The employer appealed. The Court dismissed the appeal. The Master of the Rolls said, however, that if it were the case of an independent owner constructing an independent building, even though it involved the use of the party-wall of the existing building, he should have doubts whether the employment would be about a building exceeding 30ft. in height. Lord Justice Cozens-Hardy was of the same opinion, observing that if the present case had been that of an owner building on his own land, intending merely to make such use of his neighbour's wall as a party-wall as the law allowed, he could not have agreed with the conclusion arrived at by the county-court judge. He could not have agreed that the wall, which might have been used afterwards as a party-wall, could be said to be, at the date of the accident, the wall of a building 30ft. in height which was being constructed or repaired.

Architect's Fees for Arbitration.—In the King's Bench Division of the High Court on Wednesday Mr. William Theobalds, architect and surveyor, Budge Row, London, sued Mr. Charles Clements, a builder, of Henley-on-Thames, for £102, fees for professional services rendered. It appeared that in connection with an arbitration the plaintiff was engaged, firstly, as a surveyor for the defendant, and afterwards as the arbitrator. The defendant, it was contended by the plaintiff, agreed to pay 7 guineas a day for his own services and 2 guineas a day for those of his assistant when engaged on office work, with 10 guineas and 3 guineas a day respectively when a visit to Henley took place. The defendant denied that there was any agreement to pay the fees named, characterized them as extravagant, and urged that no such agreement should be upheld in a court of law, as it was contrary to public policy that an arbitrator should be paid to act as an advocate. The jury intervened while the defendant was giving evidence, and found for him on the ground that there was no special agreement for the payment of the fees. The judge intimated his agreement with the jury's view, and stated that in any case he would have entered judgment for the defendant, the alleged special arrangement being foreign to the Arbitration Act. Judgment was accordingly entered for the defendant, with costs.

Architects' Offices and Interference with Light.—On Friday last Mr. Justice Bray gave judgment in the case of *Ambler* v. *The Bishop of Leeds* (reported on p. 35 of our issue for last week). This raised a point upon a special case stated by an umpire relating to a finding in respect to the interference with the light of premises used by an architect. It was contended by the plaintiff that his light was obstructed by the erection of the Roman Catholic Cathedral on the opposite side of Cookridge Street, Leeds, and, in consequence, that he was entitled to damages. Plaintiff was the owner of premises on the first floor of which he carried on his business as an architect, and he claimed that the erection of the defendant's cathedral was an interference with his ancient lights. Mr. Justice Bray, following the decision in the House of Lords in *Home and Colonial Stores* v. *Colls*, held that the plaintiff was not entitled to any damages. Judgment was therefore entered for the defendant, with costs.

COST OF OVERHEAD TRAMWAYS.

IN the course of a paper on "Tramway Overhead Equipment Materials" read before the Tramways and Light Railways Association recently Mr. H. M. Sayers said the cost of overhead work varied a good deal more than it should. Some authorities put it at £1,500 to £2,000 per mile of route, but he did not know how so much could be properly spent. Good work for either double or single lines could be erected for £1,200 per mile with fair profit to the contractor. Bracket-arm work for single lines, where a single line of poles was generally sufficient, could be done for £1,000 per mile, or even less under favourable conditions. These rates included average amounts of guard wiring and a proportion of junctions, but heavy and complex junctions and special requirements would involve some additional expense. A great deal of money could be spent on elaborate scrollwork and fancy painting, especially if a little gold leaf was thought necessary to harmonize with the surroundings, but these were matters of taste rather than engineering, and those who liked to pay for them would doubtless continue to do so. On the question of poles Mr. Sayers said that wood was extensively employed in the United States and some Continental countries. Very thick timber was necessary, and the poles had a heavy and stumpy appearance. The first cost was generally lower than that for steel poles, but the ultimate economy was doubtful. Lattice poles could be purchased, and were said to be cheaper than tubular poles of equal strength; but they were very ugly, and it was probable that the painting necessary to preserve them from rapid corrosion would neutralize the initial saving.

HISTORIC CITY BUILDINGS.

HISTORIC buildings in the City of London formed the subject of a paper, illustrated with lantern slides, which Mr. T. R. Croger read before the Society of Architects last Thursday. In referring to the thirteenth-century building of St. Etheldreda's Church in Ely Place he explained that it had an under croft and an upper croft, and was a rare example of a structure representing one church built on the top of another. In Queen Elizabeth's reign the building was placed in secular hands, being subsequently rented by a Welsh Presbyterian sect, and in about 1864 was put up to public auction and bought by Roman Catholics, who had worshipped there ever since. Among other churches dealt with by the lecturer was St. Bartholomew's, Smithfield, the transept of which was up to a recent time occupied by a smithy and one end of the building by a loom. This church was restored by Sir Aston Webb. The Lady Chapel of St. Saviour's, Southwark—a beautiful piece of pure Pointed architecture—was also shown. No one could say, the lecturer stated, why it was called a lady chapel. There was no evidence that it was ever so used. The little edifice narrowly escaped demolition when new London Bridge was built. It was condemned as being an obstruction to the newly-designed approach, but local opposition proved too much for the City Fathers, and the building was spared from the fate that befell the houses immediately adjacent. Other places of interest shown upon the screen and described by the lecturer were the Tower; the Dutch Church, Austin Friars; St. Olave, Hart Street; St. Helen, Bishopsgate; Crosby Hall; St. John, Clerkenwell; the Temple Church, and Canonbury Tower.

Keystones.

Mr. Joseph Pennell is going back to America for good.

The Year-Book of the Society of Architects has just been published, price 2s.

The Annual Dinner of the Surveyors' Institution will be held at the Hotel Great Central on Wednesday, March 1st, at 7 p.m.

The Priory Church of Holy Trinity, York, a very ancient building, is now undergoing restoration at a cost of £5,360 under the direction of Mr. C. Hodgson Fowler, of Durham.

The International Archæological Congress at Athens will be opened by the Crown Prince of Greece on April 7th, and will last a week. The opening meeting will be held in the Parthenon.

A Water Tower.—The Boston Waterworks Co. have decided to erect a water tower for 43,000 gallons. It will be 60ft. high, of brick, and the tank 37ft. 6ins. by 41ft. 6ins. by 4ft. 9ins. The total cost will be about £2,000.

A new Church and School at Staveley, Sheffield, has been erected for the Primitive Methodists at a cost of £2,000, from designs by Messrs. W. J. Morley & Son, of Bradford and London. Messrs. T. Lee & Son, of Staveley, were the builders.

The Auld Brig o' Ayr.—At last week's meeting of the Ayr Town Council it was remitted to the Old Bridge Committee, together with John Eaglesham, Mr. J. A. Morris and the surveyor, to report as to the best way of carrying out the work of rebuilding the bridge.

"**Old Houses in Edinburgh**" form the subject of some drawings by Mr. Bruce J. Home, which are now being issued by Mr. W. J. Hay at John Knox's House in Edinburgh and by Messrs. Samuel Bagster & Sons, Ltd., London, price 1s. each part. Prof. G. Baldwin Brown writes an introduction. In the first number there are three plates.

Sunderland's Municipal Buildings.—The foundation-stones of the new quarter sessions court, police buildings and fire-station at Sunderland were laid on Wednesday last. Messrs. Wills & Anderson, of London, and Messrs. W. & T. R. Milburn, of Sunderland, are the joint architects, and Mr. J. W. White, of Sunderland, is the builder. The buildings will cost £40,000.

The King's Sanatorium: Progress of the Work.—The east and west wings of the King Edward VII. sanatorium at Midhurst (Mr. H. Percy Adams, F.R.I.B.A., architect) are now roofed in, and the plastering is being done, while the main part of the central patients' block has reached second-floor level. The foundations for the chapel are being put in. The administration block is partly roofed in and up to first-floor level, while the laundry is being prepared for the reception of the machinery. Up to the present there has been delivered on the works 3½ million bricks, with sand, lime and cement in proportion, and considerably over 4,000 yds. of concrete. About 180 men are engaged, and this number will be increased as the work proceeds. It is hoped that the sanatorium will be completed before the end of the year.

A Competition for New Baths and Washhouses at Hammersmith, to be built at a cost of about £50,000 next to the proposed new technical school, is to be held among the following selected architects:—Mr. A. W. S. Cross, Mr. J. Ernest Franck, Mr. Maurice B. Adams, Mr. E. Harding Payne, Mr. J. R. Moss, and Messrs. H. & R. H. Spalding.

Sir Caspar Purdon Clarke, C.I.E., F.R.I.B.A., director of the Victoria and Albert Museum, South Kensington, is going to New York as director of the Metropolitan Museum. This implies the termination of about twenty-five years' service at South Kensington, commencing with the organization of the magnificent collections of Indian art—the finest museum of its kind in Europe.

Quantity Surveying, Past and Present.—In the course of a paper on this subject which he delivered before the Edinburgh Building Trades' Exchange on Thursday, Mr. W. Carrick said that, while the rules of measurement now current in Edinburgh were the outcome of the labours of representative committees, they were capable of amendment, and he expressed the hope that this might be brought about soon.

Partnership.—Mr. James Williams, of 11, Carteret Street, Queen Anne's Gate, S.W., has taken into partnership Mr. Edward L. Wratten, A.R.I.B.A., and the name of the firm will in future be Messrs. Williams & Wratten. Mr. James Williams was formerly partner with the late Mr. George Devey, of Bond Street, W., and afterwards carried on business at Victoria Street, but has now been for some years at the above address in Queen Anne's Gate.

The British Hospital at Constantinople, of which Mr. H. Percy Adams, F.R.I.B.A., of London, is the architect, was opened last week. It has cost about £35,000 and accommodates fifty patients. It is built mainly of stone from Sevastopol, though Messrs. Doulton, of Lambeth, have supplied much of the material. The fitting and furnishing has been carried out by firms in England. By the Sultan's permission, all the materials required in the construction of the building were allowed to pass into Constantinople free of Customs duty. The builder was a Greek, and his workmen were Turks and Armenians.

Acton Isolation Hospital was opened last Wednesday. It has been erected by the district council, at a cost of about £15,000, on the site of the buildings known as "The Friars" in Wales Farm Road. On the south is an observation block, and on the north are scarlet fever and diphtheria and enteric wards; also a laundry, disinfector, van sheds, mortuary, &c. The hospital provides accommodation for thirty-three beds, five in the observation ward and fourteen in each of the other two buildings. The whole is lighted by electricity. Mr. D. J. Ebbetts (surveyor to the council) was the architect of the hospital.

A Note on Skyscrapers.—In his recent paper on the visit paid to the United States and Canada last year by the Institution of Civil Engineers, Sir William White said the spectacle of the skyscrapers from the harbour of New York was remarkable and interesting, but, in spite of their advantages in concentrating business, he personally was not desirous of seeing a similar group of buildings in any city of Great Britain. In Chicago, the birthplace of the skyscraper, a law had been passed limiting the height of new buildings to 150ft., and that example would probably be followed elsewhere. In New York, south of 59th Street, there were 250 buildings of ten storeys or more, which had cost on an average £200,000 each, some of the largest representing £700,000 to £800,000 each.

Royal Academy Exhibition, 1905.—The day for receiving architectural works is Friday, March 24th, between 7 a.m. and 10 p.m.

Crieff Cottage Hospital Competition.—Out of fourteen designs submitted for this hospital, that by Mr. E. C. H. Maidman, of Edinburgh, has been adopted.

For a new Elementary School at Northwich the design of Mr. Alfred Powles, of Northwich, has been accepted in limited competition. The school will cost about £10,500.

"**One and All Gardening, 1905**" (just published from 92, Long Acre, W.C.), is wonderful value for 2d. There are 200 pages, with about 150 illustrations. The first edition is of 100,000 copies.

The Valuation Bill, 1904.—A penny pamphlet on this Bill has just been issued from Mr. S. Egecumbe-Rogers, of 27A, Farringdon Street, E.C. It is a reprint of a series of articles by an expert which appeared in the "Local Government Journal."

Edinburgh Architectural Association.—At last week's meeting—Mr. H. O. Tarbolton presiding—a paper on "The Electric Lighting of a Country House" was read by Mr. Mathew Buchan. He pointed out that practically the only difference in the lighting of a town and a country house was in the method of supply. In the town they were supplied with a current from the public supply, whereas in the country a supply had to be made on the estate. Dealing with the interior of the house, he showed the different systems of tubing and wiring, and strongly advocated the "draw-in" metal tube system.

Strand Improvement Scheme: Influential Protest.—A memorial signed by the President of the Royal Academy and a number of other distinguished painters, sculptors and architects (the last-named including Sir Aston Webb, Mr. G. F. Bodley, Mr. R. Norman Shaw, Mr. Ernest Newton, Mr. John Belcher, Prof. Beresford Pite, Mr. Basil Champneys, Mr. Reginald Blomfield, Mr. Henry T. Hare, Mr. C. F. A. Voysey and Mr. Mark H. Judge) is to be presented to the London County Council expressing the opinion that the frontage-line now proposed will have a bad effect, and hoping that the Council will yet adopt some plan showing better consideration for the churches of St. Mary-le-Strand and St. Clement Danes. Protest is also made against the height of the buildings already begun, and the hope is expressed that on the rest of the frontage the new buildings may not be so lofty as to overpower the two churches and Somerset House, "which are and should remain the principal ornaments of the Strand."

The Education of the Architect.—At last week's meeting of the Glasgow Architectural Association a paper on this subject was read by Prof. Eugene Bourdon, B.A., A.D.F.G. Mr. John Keppie, I.A., F.R.I.B.A., president of the Glasgow Institute of Architects, presided. Professor Bourdon said that it was only by assisting a good practical architect that the pupil could profit by the theoretical tuition that was imparted to him in school. Without any practice the pupil might become a good draughtsman, an able calculator, but he could never be truly an architect. Still there was a necessity for schools. Architecture must be taught in all its branches in a school of architecture. School and office training were both necessary, and the question was how to divide a young man's time between school and office. He suggested a four years' course at a day school of architecture, or, where students were unable to attend such a school, they might go to evening classes and in seven years cover pretty nearly the same ground as a student in the four years' course at a day school.

FOLDING OR SLIDING DOORS.

THE advantages of double doors between two large rooms are beyond question, but it often occurs that folding doors are a great inconvenience, as they must of necessity have projecting hinges, sufficient to clear architraves or pilasters, as the case may be, and the strain on these is so great that the doors invariably drop and drag on the floor or carpet; moreover, when folded back they are apt to destroy the uniformity of the room.

To obviate this inconvenience and unsightliness, I venture to offer an alternative, as well as a contrivance for opening and closing the doors simultaneously.

At a suitable height two chases are formed $4\frac{1}{2}$ins. wide and 3ins. longer than each door, exactly in line with each other (see Fig. 1), and two or three steel joists or lintels are fixed, of section and strength corresponding to the width of opening and what they have to carry. Fig. 2 shows the gearing with doors closed. Figs. 3 and 4 show the middle hanger, also the gearing with the doors about 1ft. apart. The middle hanger is different to the others in one respect only—it has to carry the centre wheel which is worked by the "rack" bars, reverse in action.

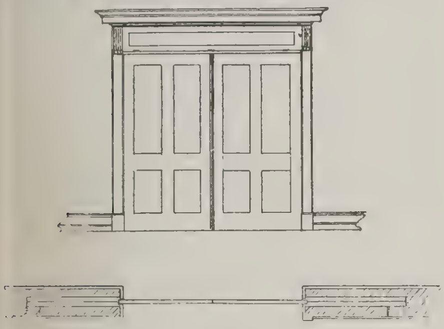


FIG. 1.

The steel "rack" bar is fixed to one door with a special twisted strap, and the other is secured to the friction-roller case with set-screws. The steel running bar is fixed at both ends and to as many hangers as necessary, about 2ft. 6ins. apart, perfectly level and rigid and the hangers bolted to the lintels.

After the gearing has been fitted to the doors on the bench, pack up the doors in their places in the opening, then fix the gearing and insert the centre wheel with the doors closed. Put friction rollers to each door as guides at the bottom (Fig. 5), and fix a metal guide in an oak sill in each chase for the length of the doors only; the ends near the opening must be pointed so as to avoid trouble in steering the roller on the closing stile when pushing the doors into the chase.

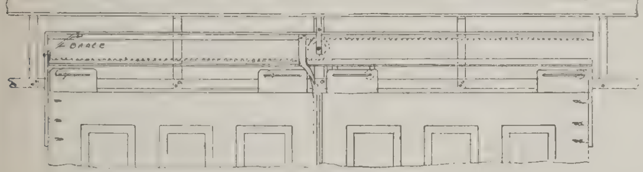

FIG. 2.

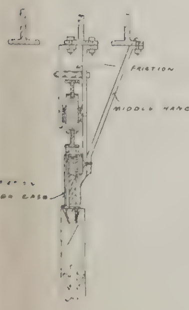

FIG. 3.

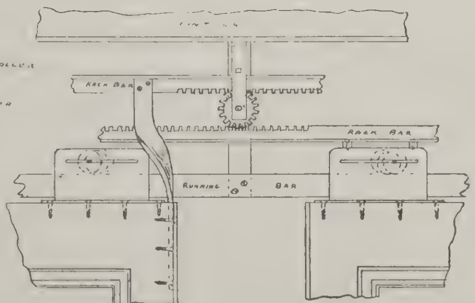

FIG. 4.

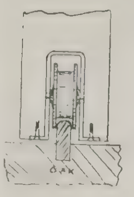

FIG. 5.

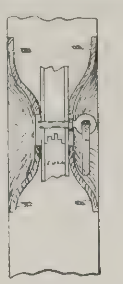

FIG 6.

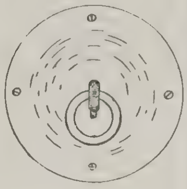

FIG. 7.

A hook single-bolt mortice lock specially adapted to sliding doors is required with flush cups and key with ring to same (Figs. 6 and 7); also flush sash lifts let in the door stiles above the lock and one drop flush hook let in the edge of each door. The meeting edges of the doors can be grooved and tongued or rounded and hollowed to taste; a rounded edge would be best for shaping the face of the lock to same. Put $1\frac{1}{2}$in. indiarubber door stops as buffers on the back edge, top and bottom, of each door, with oak sill and metal guides, leaving an opening behind the skirting at the end of the chase; for fixing same the frieze panel to be hung to the soffit lining so as to give access to the gearing, which may require adjustment and lubrication.

There is an alternative to the "rack" bars, to which objection may be raised on the score of noise, which is, to provide steel flexible wire cords acting on a sheath pulley instead of the cog wheel. The reversing action will be similar, but one cord must work around the pulley from the top and the other from the bottom; the cords must also have a tightening screw through the guide bar on the back edge of the doors, and the sheath pulley must have two grooves, each cord working in its own groove. The doors can be framed and moulded to suit any design, with pilasters, frieze and cornice; they can have silvered plate glass on one or both sides, in which case the inside of the chases will need to be rendered smooth in Parian cement about 18ins. from the lining and distempered black to avoid reflecting rough work when the doors are half open.

WILLIAM MIDDLETON, A.B.I.C.C.

UNIVERSITY COLLEGE SCHOOLS.

IN the council room of University College, Gower Street, London, Mr. Paul Waterhouse's design for the new medical school has been on exhibition during the past week, together with the five competitive designs for the new buildings of University College School at Hampstead.

The new medical school is to be erected in University Street, facing the Hospital. Funds for the erection of the school have been generously given by Sir Donald Currie. The elevation is dignified. It is classic in treatment, and comprises a podium of stone with a pedimented centre block having columns on each side and wings to right and left similarly treated. In the basement will be a gymnasium, theatre, lecturers' room, &c.; on the ground floor, dining- and sitting-rooms to the right and a library to the left (extending two floors up); on the first floor a pathological theatre, laboratories and bed- and sitting-rooms; on the second floor a museum in the left wing (extending to the third floor), a practical classroom for chemical work and research, bacteriology theatre, and more bedrooms in the right wing; the third floor being occupied by demonstration and experimental rooms and bedrooms.

For the new school at Hampstead Mr. Arnold Mitchell, Mr. Henry T. Hare, Mr. Paul Waterhouse, Mr. H. Chatfeild Clarke and Prof. F. M. Simpson were invited to submit designs The selected design, by Mr. Arnold Mitchell, shows a school planned in three blocks connected by covered ways, but treated as an architectural whole. The central block is entirely occupied by the central hall (96ft. by 47ft.) and the classrooms ranged around it, each of which is lighted from the left and has at least one window carried up to the ceiling. On the ground floor there are ten classrooms and on the first floor fourteen, each 23ft. 6ins. square, with an area of at least 18ft. super. per scholar. To the left of the central block is a wing comprising the dining hall (60ft. by 56ft., on the first floor, with accommodation for 300 boys) and service department, while the wing on the right is devoted to science and art rooms. The roof of the central hall is pitched high and flanked by two cistern-room turrets. There are no corridors in the main teaching block, all the classrooms opening direct from the hall, thus securing economy of space and good supervision. The school is proposed to be carried out in brick, and at 1s. per cubic foot is estimated to cost £58,411, including £500 for gravelling playgrounds, £500 for ventilating fans, &c., £1,000 for hot-water heating, £1,750 for water-closet buildings, £1,000 for four covered fives-courts and £4,000 for boundary walls and fences.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Sewage Scheme for Rural District Council.

THAME.—SPRINKLER writes: "A sewerage and disposal scheme for a small township of about 12,000 inhabitants will shortly be receiving attention by a district council. Which would be the cheapest scheme to adopt: (*a*) a septic tank and double contact, or (*b*) a septic tank and continuous filtration with the aid of a revolving sprinkler? Can you suggest a cheaper system which would comply with the requirements of the Local Government Board? It will not be practicable to treat the sewage upon land, as the gradients of the proposed site are too steep. Is there a book published giving examples of conditions of contracts applicable to engineering works?"

The comparative cost depends to a large extent on local conditions, but the expert evidence given before the Royal Commission on Sewage Disposal goes far to prove the *necessity* of the septic tank for small disposal works. Either the double contact or continuous filtration would be suitable for after-treatment; but the cost of the sprinkler apparatus would probably make the latter method dearer. Moreover with the small population named it is doubtful whether the normal flow would be sufficient to work the apparatus. Much useful information is given on questions of sewage-disposal in "The Sewage Problem, a Review of the Evidence collected by the Royal Commission on Sewage Disposal," by A. J. Martin, A.M.I.C.E., &c. (8s. 6d. post free from these offices). Though the Royal Commissioners have not yet presented their report upon this evidence, the expert evidence and experience is exceedingly valuable, and is so arranged as to be easily understood. A good set of conditions of contract for engineering works appears on page 199 of "Specification No. 6, 1903" (2s. 6d. nett, 3s. post free from these offices). All these matters will be fully dealt with in "The Municipal Engineers' Specification," the first number of which will be issued shortly from our offices at the same price as "Specification." Both publications are issued annually.

Dilapidations: Surveyors' Fees.

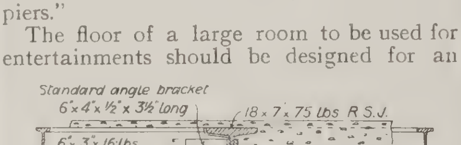
LONDON.—LESSEE writes: "After a notice and schedule have been served on a lessee to repair premises in accordance with covenants, and the work has been executed in accordance with the schedule, application is made for surveyor's fees in preparing schedule, &c., the amount of which was stated in the notice. The lessee writes in reply to such application for fees as follows: 'I have to say that I have already read the sub-sections of the Act you mention—The Conveyancing and Law of Property Act, 1892, 55 & 56 Vict., c. 13, section 2, sub-section 1—in fact it is the same authority as I take myself, but it seems to me that you have not given the subject the thought necessary to get at its proper meaning. If you read carefully you will see that the first part can only be acted upon after the latter part has come to pass. This has not happened, as I have not been relieved by the court. So that you see the whole thing hinges upon that word "relieved." You are also in it referred to the Act (same name) 1881. You will find it section 14, sub-section 1, and after reading that I will bring to your notice the following ruling in a case that was fought out and for which I give you particulars so that you may disprove it if you can. *Nind* v. *Nineteenth Century Building Society* (1894, 2 Q.B., 226). Lord Esher, M.R., and Davey, L.J. A lessee who has complied with a notice under section 14, sub-section 1, of the Conveyancing and Law of Property Act, 1881, to remedy a breach of covenant has not been "relieved" so as to be liable to an action under section 2, sub-section 1, of the Conveyancing and Law of Property Act, 1892, for costs and expenses in reference to such breach, "relieved" in that sub-section meaning relieved by the court. But so far as the fees of the solicitor and surveyor are concerned it has been decided that this provision only applies where the lessee is actually relieved by the court under sub-section 2 of section 14 of the Act of 1881, and not to the case where by complying with the notice under sub section 1 he prevents all rights of forfeiture from becoming enforceable.' Is the lessee correct?"

Under the circumstances mentioned, viz., that upon receipt of the schedule of dilapidations the lessee immediately executed the repairs in accordance therewith, I am of opinion that costs cannot be enforced against him. The lessor's surveyor was, however, correctly following the usual practice when including the amount of costs in the claim, as in case of proceedings for forfeiture the incidence of such fees would be in the discretion of the court. It is worthy of note that in the above quotation from the 1892 Act the important words, "in reference to any breach giving rise to a right of re-entry or forfeiture which at the request of the lessee is waived by the lessor by writing under his hand, or from which the lessee is relieved," &c., are omitted. If the circumstances mentioned have occurred in this case the lessor can recover his costs. With regard also to the quoted case, *Nind* v. *Nineteenth Century Building Society*, your correspondent omits the vital point of the decision, viz., that the action failed because the defendant was only a sub-lessee. You will find in the "Professional Notes" of the Surveyors' Institution, Vol. VI., p. 499, a report of the trial in the Divisional Court (when the costs were awarded to the lessor), and in Vol. VII., p. 70, the judgment of the Court of Appeal, reversing the decision of the lower court upon the grounds that "an under-lessee is not as between himself and the original lessor a 'lessee' within the meaning of the Conveyancing and Law of Property Act, 1892, section 2, sub-section 1, and therefore such lessor cannot recover from him the costs and expenses mentioned in that sub-section." Should you have access to the "Transactions" of the Surveyors' Institution, you will find a very interesting paper on this subject in Vol. XXV. (1892-3); reference to pages 332 and 333 will show the state of chaos in which this particular point stands at the present time.

F. S. I.

Rolled Joists and Concrete Floor.

HULL.—CONSTANT READER writes: "I send a sketch of a concrete floor which I propose to put in to a building. Do you consider it a safe and good method of construction? The room is 25ft. span, and is to serve as a reading-room and for entertainments. The main girders are 14ins. by 6ins., spaced 9ft. 4ins. apart, and the cross-girders 6ins. by 5ins, spaced 4ft. apart and filled in with good concrete. The walls are 14ins. thick, with piers."



The floor of a large room to be used for entertainments should be designed for an external load of $1\frac{1}{2}$ cwts. per ft. super. besides the structural load of $\frac{3}{4}$ cwt. per ft. super. In the present case, with a span of 25ft. and main girders 9ft. 4ins. apart, cross-girders 4ft. apart and concrete 7ins. deep, the structural load on each main girder will be $25 \times 9\frac{1}{3} (1\frac{1}{2} + \frac{3}{4}) \div 20 = 26\frac{1}{4}$ tons distributed. This will require a rolled steel joist 18ins. by 7ins. by 75 lbs. per ft. run. The cross-girders, being 9ft. 4ins. span and 4ft. apart, will have to carry $9\frac{1}{3} \times 4 (1\frac{1}{2} + \frac{3}{4}) \div 20 = 4\frac{1}{5}$ tons distributed, for which rolled steel joists 6ins. by 3ins. by 16 lbs. per ft. run will be suitable, and the whole arrangement will be as illustrated above.

HENRY ADAMS.

Cottages on a Building Estate.

NORTHWOOD.—C. N. writes: "A built two houses on an estate facing a road. Later, B came along and bought a vacant space at the corner of the road (but not from the original vendor) and also three of a row of cottages facing the adjoining street: and he now proposes to cut off part of the gardens of these three cottages bought by him, and to erect two houses next A, thereby blocking the view of the country from the windows on the flank wall of one of A's cottages, which could not be shut out if the plots were used as laid out in the first instance. Has B a right to do this? Can B, in extending the row of cottages, build up to th street boundary?"

However unpleasant his proceedings may be to his neighbours, (1) B is quite withi his legal rights in building the houses a sketched in your plan; unless it can be prove that the original vendor, when cutting u the estate, made such "Building Regulations" as prohibited the subsequent use o any of his land in the manner now proposed A (being one of the original purchasers would be able, by reference to his deeds, t say whether this was the case or not. (2) is also within his rights in extending his row of cottages to the full extent of his land unless it can be shown that a "building line" was laid down in street E by the origina vendor, and that the various plots were sol subject thereto. (3) Of course B's plan will fall to the ground should he not b allowing sufficient air-space in the rear o his new houses to comply with the loca by-laws, but this contingency is, I think, remote one.

F. S. I.

Book on Nonconformist Architecture.

Referring to the enquiry on p. 19 of ou issue for January 11th, Mr. R. M. McDowall architect, of Castleford, writes: "Th book your correspondent enquires about i 'Churches, Mission Halls and Schools fo Nonconformists,' by Messrs. Crouch & Butle architects, of Birmingham, published a 4s. 6d. nett by Messrs. Buckler & Webb, o Church Street, Birmingham. It is ver suggestive in the way of plans."

"Light" Cases.

MANCHESTER.—W. S. writes: "Where ca I find full particulars of the most recent an important decisions in right of light cases?"

See the reports in our own columns; als "The Architects' Law Reports," price 5s. (re viewed on p. 13 of our issue for January 4th

Kitchen below Ground-level.

TUNSTALL.—SUBSCRIBER writes: "It i proposed to build a kitchen on one side o an old wall. The ground on the other sid will be 3ft. above the kitchen floor. T keep the place dry I propose to insert damp-course above the ground-level, and t float the wall inside with neat cement in stead of the ordinary plaster floating, an then to skim the whole over, as usual, wit plaster skimming. Would this method kee the kitchen dry, and would the ceme perish the plaster skimming? Would Keene cement be suitable?"

The ground should be dug away from th wall and the vertical damp-course put o that side in mastic asphalt. Ceme plastering would not then be necessary. moisture is allowed to penetrate the ol wall, as you propose, the plastering, wheth it be in cement or not, would probably co off. Plaster will adhere to cement if t surface of the latter is roughened so as give a key.

Cement in Concrete Floor.

ENQUIRER writes: "Please state wh amount of cement should be used in layi a concrete floor 3ins. thick in the followi proportions:—$2\frac{1}{2}$ parts whin gravel, 1 part Portland cement and 1 part of sand. there any data published on the subject?"

For memoranda of this kind you shou consult "Specification" (price 3s. 3d. p free from our offices). It is easy to calcula the amount of cement required. 1 sq. ft. the floor equals $\frac{1}{4}$ cub. ft. of concrete. diminution of bulk varying from 20 to p r cent. takes place when the whole of t materials composing the concrete are mix together, wetted and finally rammed in position. This means that for every cub. ft. finished concrete $1\frac{1}{3}$ cub. ft. of materials w be required, and as $\frac{2}{9}$ths is cement, $\frac{2}{9}$ths sa and $\frac{5}{9}$ths whin gravel, the quantity cement required per ft. super. will be $\frac{4}{3} \times \frac{1}{4}$ $\frac{2}{9} = \frac{2}{27}$ cub. ft., or $\frac{2}{3}$ cub. ft. per sq. yd.

Builders' Notes.

A new Reservoir for Skipton is to be onstructed at Embasay Moor at a cost of '70,000. Storage will be provided for 20,000,000 gallons.

Bath Master-Builders' Association.—Mr. red J Blackmore has been elected president or the current year, with Mr. William Webb s vice-president. The annual dinner is to e held on February 14th.

Employment in the Building Trade in December is reported by the Board of Trade o have been dull—rather worse than in November, and much worse than a year ago. The percentage of unemployed trade-union members among carpenters and joiners was 1·5 at the end of December, compared with 0·1 at the end of November and 7·9 a year go. The percentage for plumbers was 10·0 t the end of December, compared with 10·2 t the end of November and 7·7 a year ago.

A Congress of the Royal Institute of Public Health is to be held in London from July 9th to 25th. There will be nine sections, ncluding one on engineering and building onstruction (municipal and educational). An exhibition of sanitary appliances, &c., will be held in the Polytechnic, Regent Street, in connection with the Congress. Central floor-space for stalls is to be let in blocks of 8ft. by 6ft., price £10 10s. each (including one page of description in official programme and catalogue); extra frontage £1 1s. per foot; wall-space in blocks 10ft. by 8ft. at £7 per block (also with one page of description in programme and catalogue). Full particulars can be obtained from the ecretary of the exhibition, Royal Institute of Public Health, Russell Square, W.C.

Dublin Master Builders' Association.—Mr. James Beckett has been elected president for 1905 and Mr. Thomas Conolly vice-president.

Dissolutions of Partnership. — Messrs. Mallett & Wood, builders and contractors, of Luton, have dissolved partnership; also Messrs. Knight Brothers, builders and contractors, of Bethnal Green.

New Lunatic Asylum for Essex.—The Essex County Lunatic Asylum at Brentwood being inadequate, the county council has decided to erect a new building at Colchester at a cost of half a million sterling.

The Stobhill General Hospital, Glasgow, is being warmed and ventilated by means of eighty Shorland's double-fronted patent Manchester stoves with descending smoke flues, supplied by Messrs. E. H. Shorland & Brother, of Manchester.

Institution of Heating and Ventilating Engineers.—The annual general meeting of this Institution was held on January 17th at the Holborn Restaurant, Mr. J. Palmer in the chair. Mr. George Crispin delivered his presidential address, in the course of which he suggested that during the year a competition for boilers up to 2,000ft. heating power might be held in the neighbourhood of a town such as Stourbridge, somewhat similar to the one held at Liverpool about fifteen years ago. A paper on "The Science of Ventilation: The Advantages and Limits of 'Natural' and 'Mechanical' Systems Compared" was read by Mr. J. D. Sutcliffe. Prize medals were presented to Mr. J. Nelson Russell and Mr. A. H. Barker for the two best papers read during the past year. The annual dinner was held in the evening. The next meeting of the Institution will be held at Bristol on June 20th and 21st.

Bankruptcies.

[Abbreviations: R.O.—receiving order; P.E.—public examination; C.C.—county court; O.R.—official receiver; Adj.—Adjudication.]

DURING THE WEEK ending January 18th twenty-nine failures in the building and timber trades in England and Wales were gazetted.

E. STONHAM, builder, Ilford. R.O. Jan. 12th.

J. ALMOND, builder, St. Helens. R.O. Jan. 14th.

A. GEARY, builder, Burton-on-Trent. Adj. Jan. 12th.

E. SPICER, builder, Mortlake. R.O. Jan. 12th.

STEVENS & Co., builders, Southall. R.O. Jan. 10th.

C. MOELLER & Co., engineers, Bradford. Adj. Jan. 11.

F. JOHNSON, timber merchant, Urmston. R.O. Jan. 12th.

W. P. MULHOLLAND, builder, Great Crosby. P.E., Liverpool C.C., Feb. 2nd, at 11.

W. GOODMAN, plumber, Leicester. P.E., The Castle, Leicester, Feb. 3rd, at 10.

NEWTON & BURGESS, builders, Clapham Junction. R.O. Jan. 10th.

D. J. DAVIES, builder and contractor, Blaengarw. P.E., Cardiff Town Hall, Feb. 6th, at 11.

W. J. RICE, builder, Lowestoft. Gross liabilities £10,140; estimated surplus £832.

J. E. BUCKELDEE, builder and contractor, Hillingdon. Liabilities £914; assets estimated to produce £110.

J. DAY, builder, Wolverhampton. Gross liabilities £1,724; estimated surplus £186.

CHARLES BROTHERS, builders and contractors, Moseley. Liabilities £1,605; assets £926.

F. KEMP, builder, Hove. First meeting, O.R.'s, Brighton, Jan. 25th, at 11.30. P.E., Brighton C.C., Feb. 2nd, at 11.

E. W. SANDERS, builder, Rottingdean. First meeting, O.R.'s, Brighton, Jan. 25th, at 12. P.E., Brighton C.C., Feb. 2nd, at 11.

W. H. WESS, builder, Acock's Green. First meeting, 191, Corporation Street, Birmingham, Feb. 1st, at 11. P.E., Birmingham C.C., Feb. 23rd, at 2.

T. PHILLIPS, contractor, Barnsley. First meeting, O.R.'s, Barnsley, Jan. 25th, at 10.30. P.E., Barnsley C.C., same day, at 11.30.

D. ROBERTS, late builder, Chorlton-cum-Hardy. Gross liabilities of £4,183 expected to rank at £1,015; deficiency £127; assets £887.

J. SMITH & Co., moulding and joinery manufacturers and importers, Lambeth, Walworth, Barking and Liverpool (adjudged bankrupts Oct. 1904). Joint liabilities £33,629; assets £14,000. Discharge of Jonas Smith granted subject to his consenting to judgment for £100. T. W. Smith's discharge suspended for two years.

Obituary.

Mr. Isaac Rutter, builder, of Willington, died recently, aged 83.

Mr. W. Goldsworth, surveyor, of Prescot, died recently, aged 81.

Mr. T. W. Shore, of Balham, a well-known antiquary, died recently.

The late Mr. John Parnell, builder and contractor, of Rainsbrook, Rugby, left estate of the gross value of £107,381.

Mr. W. Webb, for many years a builder in Dudley in partnership with Mr. Mark Round, died recently.

Mr. J. Farquharson, of the firm of S. & R. Slater, builders, Edinburgh, died last week in his fifty-seventh year.

Mr. G. H. Stanger, F.R.I.B.A., A.M.I.C.E., of the firm of Stanger & Stanger, civil engineers, architects and surveyors, Wolverhampton and Westminster, died recently, aged 57. He was architect of the cottage homes at Wednesfield, the extensions of Burntwood Asylum, the large works at Bushbury for the Electric Construction Co., the Wolverhampton Steam Laundry, extensions of the out-patient department at the Wolverhampton and Staffordshire General Hospital, and Moseley Village Board school. The last important work on which he was engaged was an isolation hospital at Harrogate.

Mr. Thomas Blashill, F.R.I.B.A., formerly architect to the London County Council, died on Friday at 29, Tavistock Square, after a short illness, in his seventy-fifth year. He was elected an Associate of the Royal Institute of British Architects in 1866 and a Fellow in 1877. Mr. Blashill had been a member of the council, and was also a member of the council's Board of Examiners for Architecture and of the Statutory Board of Examiners. He was also a Fellow of the Surveyors' Institution and of the Zoological Society, and a member of the British Archæological Association and of the London Architectural Association, of which society he was president in 1862. Formerly he held a commission in the Honourable Artillery Company. He was the son of Mr. Henry Blashill, of Sutton-on-Hull, Yorkshire, and was born in 1830. He was educated at Hull and Scarborough, and professionally at University College and in London offices. Mr. Blashill formerly practised on his own account as an architect, and afterwards occupied the position of district surveyor in London. He was one of the founders of the British Fire Prevention Committee. He was a familiar figure at the Institute meetings, and his opinion on constructional matters was much valued. It was during his occupancy of the position of architect to the London County Council that the large rebuilding of the Boundary Street area, Bethnal Green, was carried out.

St. Erkenwald's Church, Southend, is now being erected from designs by Mr. Walter J. Tapper. It will consist of a nave of four bays, with a north aisle, at the eastern end of which will be a morning chapel and a chancel of two bays. There will be accommodation for 810 worshippers, and the total cost will be about £15,000.

L.C.C.

THE adjourned report of the Works Committee for the half year ended September 30th last came up before yesterday's meeting of the London County Council. This showed a balance of cost below final certificate of £10,674, or 10·88 per cent. on the total of the final certificates. Ten out of eleven works were carried out at a cost below final certificate. The total of the accepted estimates for the works completed during the half year amounted to £104,208, while the total of the final certificates was £98,062. As in previous statements, the total of the accepted estimates considerably exceeded the total of the final certificates. In this case the excess amounted to £6,145, or 6·26 per cent. Among the costs was that of £3,058 for again remetalling the Victoria Embankment. The Bridges and Improvements Committee recommended the Council not to give further consideration for the present to the proposal to transfer Charing Cross Station to the other side of the river and rebuild Hungerford Bridge, and the Bridges Committee further reported in respect of the new Vauxhall Bridge that although more than one-half of the contract time had elapsed the total value of the work executed on the bridge site was only £25,600, or barely 22 per cent. of the contract sum, excluding provision money of £117,082. The greater part of the more difficult work still remained to be done.

A Large College is to be built on the Fairhaven Estate near Lytham.

THE

BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD.

February 1, 1905. Vol. 21, No. 521. 6, Great New Street, Fetter Lane, E.C.

Summary.

The Nottingham Architectural Society has passed a resolution supporting architects' registration and hoping that the Institute will prosecute the early adoption of the Bill. The president, Mr. Brewill, said that, as far as possible, all points of difference were being eliminated from the Bill, and if in that way the thin edge of the wedge could be got in, all the other matters they would like to see brought about might follow in due course. (Page 57.)

The £2,000 for the employment of 200 men at the First Garden City has been more than subscribed. (Page 64.)

British standard tables of pipe flanges have been issued by the Engineering Standards Committee. (Page 64.)

It was Mr. W. E. Riley, superintending architect to the London County Council, who prepared the sketch design for the Victoria Station wall along Buckingham Palace Road. (Page 67.)

The Works Committee of the Leeds Corporation has decided in favour of the Colsterdale reservoir being carried out by contract. (Page 64.)

A bricklayer at Birmingham who was injured whilst helping a foreman to move a girder has been refused compensation, Judge Whitehorne holding that the accident did not arise out of the bricklayer's employment. (Page 59.)

Mr. Howard Pentland, B.A., F.R.I.B.A., in a paper on old plasterwork in Dublin which he read before the recent convention of the Master-Painters' Association of Ireland, said he knew of only one example of such work n which Wren was concerned, and that was the ceiling of the chapel at the Royal Hospital, Kilmainham. (Page 58.)

In a paper on Byzantine architecture which he read before the Architectural Association on Friday Mr. J. B. Fulton said that no other building could compare with Santa Sophia in beauty, fine proportion and delicate detail. Mr. E. F. Reynolds, in a paper on the same subject, said the uniqueness and originality of the building lay in the combination of two types of plan which hitherto had been developed more or less separately—the basilican and the radial, the former being ounded on a repetition of bays in length and he latter on a repetition of bays around a common centre. (Page 61.)

Mr. Reginald Blomfield has been elected an A.R.A. (Page 64.)

English building stone is being extensively used in South Africa. Even though carried 7,000 miles over sea, it is said to be cheaper han local stone, which is difficult to work, and for which means of transport are deficient. (Page 60.)

The brick trade in Northamptonshire is very depressed. (Page 64.)

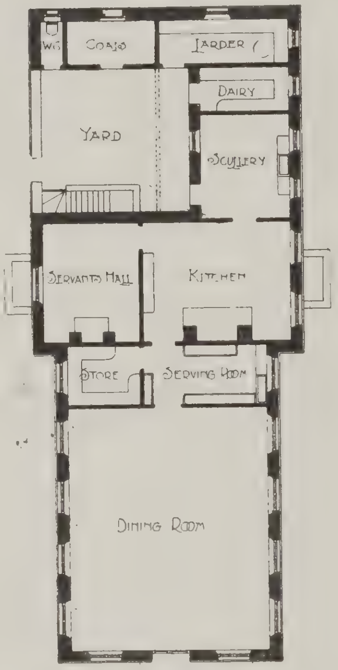
Registration: An Interim Announcement. THOUGH some speakers have suggested that the Institute committee on architects' registration is not alive and at work, the fact is quite the reverse. The full and careful consideration of this most difficult matter must necessarily involve much time. The question is not to be settled off-hand. And it must not be decided hurriedly. Architects, therefore, should bear themselves in patience till the committee's report is to hand. We note continual references in the provinces, the latest from Nottingham (as reported in this issue), and these convince us of the great bulk of opinion in favour of registration that exists throughout the Kingdom. It is not our purpose now to re-open the discussion on the subject, but we think it interesting to give the following particulars concerning the position of architects in Europe and America which have been collected for the purposes of the committee. The profession is absolutely free in Austria, Holland, Belgium, Switzerland, Norway and Sweden, France, Turkey, Portugal and the United States (excepting three States). It is free (but Government officials require diploma) in Germany, Hungary and Greece. A diploma is required in Italy, Spain, Russia and Illinois (U.S.A.). In Germany architects who have studied in the State high schools can enter for the examination granting the title of "Government architect," which title is obligatory for architects of public works and is now almost always required for city architects. In Austria there are Government diplomas, but they are little sought after by artists, as they only have a scientific value. In Hungary, though the profession is free, an architect holding an official position must be provided with a diploma granted by the Polytechnic School of Budapesth after a four years' course. Holders of this diploma alone are recognized by the Courts as official experts or "Directors of Buildings." In Holland the State Polytechnic School of Delft grants a diploma of architect-engineer after a four years' course; but this is in no way obligatory. In Italy the compulsory diploma is granted by the Government on the recommendation of the Examination Commission of the Government "Schools of Application." The scientific side is dominant. The same diploma is given to both architect and engineer. In Spain the architect must pass examinations after his studies and be provided with the diploma granted by the only two schools that exist in Spain: the Superior School of Architecture, Madrid, and the School of Architecture, Barcelona. In Russia the compulsory diploma or certificate is granted by the Imperial Academy of Fine Arts, the Moscow School of Architecture, and the State Polytechnic Schools. A certificate is granted to *bona-fide* practitioners and assistants after passing an examination held by the Technical Committee of the Minister of the Interior; this, however, does not give the title of architect but the right only to practise. In Greece the Government gives no diploma, but the diploma granted by the School of Art of Athens is sought for only by those who wish to occupy an official position. In France the Government gives diplomas to the nominees of the Ecole des Beaux-Arts and the title "Architecte diplômé par le Gouvernement"; but these diplomas confer no privileges or rights whatever, and no official need possess the diploma or any other certificate of an examining body.

Buttresses. A CORRESPONDENT, referring to an illustration of a small house in our last issue, raises a point of some interest which has on numerous occasions been the subject of criticism. He says: "I notice the west side is well shored up with two buttresses at the angles of the ingle-nook. It would be interesting to know whether the house is liable to be blown over by easterly gales or whether the ground on the west side is treacherous." It is surprising to find eminent architects adopting buttresses where there can be no possible constructive reason for them. Of course we all know what their answer would be, namely, that they feel them necessary in order to give the right note in the proportion of the elevation; that these buttresses look well, are picturesque, or are in "style." All this supposes that there are no rules and no reasons in architectural design except personal taste. This last Heaven-sent commodity has been the bane of modern architecture. The architect who takes this view is merely using the same old shibboleth as the painter, the sculptor, the poet, the musician, the actor and others who imagine they can become artists without training and study. Graphic design (into whose sphere it might be argued these useless buttresses would come) is just as much subject to the principle that the form must be dictated by its function as is engineering design. These buttresses are illogical if they serve no constructive purpose, and they are therefore bad art. In churches of Gothic design they are often found in obedience to some rule of a Church society. There is one modern Nonconformist church in North London where a small stone entrance porch has huge buttresses of about 3ft. projection at the base; and many modern houses look almost as ludicrous. The buttress that is not designed to take a thrust belongs to the school of "L'Art Nouveau," and together with the blocked column and the split pediment betrays an ignorance of what architecture is.

WINSLEY SANATORIUM.

THE Winsley Sanatorium has been built by the executive committee of the Gloucestershire, Somersetshire and Wiltshire branch of the National Association for the Prevention of Consumption, and is intended for the use of the consumptive poor of the three counties. Forty of the beds are maintained by town and rural district councils, individual firms, groups of persons and private donors; the remaining twenty beds being maintained by an average payment of 6s. per week per patient. Dr. Lionel Weatherley, the chairman of the executive committee, has throughout given the closest personal attention to every detail, and the successful realization of the scheme may be truly said to be entirely due to his untiring energy and devotion. Accommodation for sixty patients is provided in two buildings, one constituting the administrative block and the other containing bedrooms only, each consisting of a long narrow block one room deep, with a corridor immediately behind. The administrative block is of two storeys only, except at each end, where six bedrooms and linen-rooms are provided on the second floor. The ground floor of this block contains a spacious reception room with a large bay window, four rooms for the use of the resident doctor, two rooms for the matron and six bedrooms for patients. A large cloakroom is placed at each end of the building and immediately opposite are two projecting wings containing the staircases, bathrooms, lavatories, w.c.'s and housemaids' closets: all being separated from the corridors by cross-ventilated passages. The first floor is arranged in an exactly similar manner and contains, in addition to the above-mentioned sanitary provisions, sixteen bedrooms, fourteen of which are for patients and the remaining two for nurses. The bedroom block consists of three floors: the ground floor contains two cloak-rooms and ten bedrooms, while the first and second floors each have twelve bedrooms, in addition to a linen-room and two bedrooms for nurses. In the wings at each end are the staircases, bathrooms, w.c.'s and housemaids' closets. The corridors are wide and have bay windows at intervals, and are amply lighted and ventilated. At each end are the exit doors, with ventilating fanlights over, a through current of air from end to end being thus secured. The rooms in the administrative block are 13ft. 6ins. by 11ft. 6ins. and 10ft. by 9ft. 6ins. upon the ground and first floors respectively. In the bedroom block the rooms are 12ft. 6ins. by 11ft. and 9ft. 6ins. high, and each room is lighted by very wide and lofty windows extending up to the ceiling. The windows throughout are wooden casements and frames with mullions and transoms, every light opening; the parts below the transoms are hinged at the sides and open outwards, while those above are hinged at the top and open in a similar manner. In the walls opposite the windows, and above the level of the door-heads, the whole width of each room is filled in with casements and frames extending to the ceiling, every one opening upon centres, thus securing complete cross-ventilation. Some of the bedrooms are provided with fireplaces for use in certain cases, but the building is heated throughout by hot water upon the low-pressure system.

The block containing the dining hall and kitchen and offices connected therewith is entirely detached from the main block, being approached by a paved walk, merely roofed over. The dining hall is a lofty apartment 33ft. by 27ft., and capable of accommodating sixty patients, with additional seats for the doctor and two or three visitors. The room is lighted by eight lofty windows, four on each side, and two at the end where the main entrance is placed. At the opposite end is the serving-room, provided with a hot-plate, butler's sink and cupboards for china, glass and plate. Opposite to the serving-room is a large storeroom. A servants' hall adjoins the kitchen.



The serving-room communicates with the kitchen, and beyond is the scullery. The dairy and larder are placed outside and are approached by a covered way, being thus cut off by the open air from the kitchen and scullery. A small enclosed yard is provided, in which are placed the coal store and the servants' w.c., and also the approach to the heating chamber and coke store, which are under the kitchen and servants' hall.

All the interior walls are finished with hard plaster, and circular angles are everywhere adopted; right angles and mouldings being avoided wherever possible. Every precaution has been taken to secure perfect cleanliness in the sanitary fittings, and the drains are of Doulton's salt-glazed stoneware socketed pipes, jointed in cement. The sewage from the buildings is carried to an old quarry situated in the grounds, and is there effectively treated on the most modern biological system. Rainwater is collected in a large tank constructed in another quarry and utilized for laundry purposes. Drinking water is obtained from a local company, a large iron tank providing sufficient storage.

The buildings and grounds are lighted by electric light, a very complete plant having been laid down for the purpose. The laundry is quite away from the main buildings, and adjoins the electric-light station.

Accommodation for servants has been provided by adapting some existing cottages; thirteen bedrooms, a bathroom and storeroom being thus obtained.

The furniture is of the simplest character, and has been designed by the architects for sanatorium purposes. Each bedroom contains a white enamelled bedstead, washstand, dressing chest, wardrobe, bedside table, a comfortable arm-chair and a single chair: the whole (with the exception of the arm-chair) being enamelled white and having nickel-plated fittings. The floors are covered with specially-made floorcloth. A rest shelter 100ft. long forms a connection between the

two blocks. The plans of the building have been prepared by Messrs. Silcock & Reay, of Bath, the builders being Messrs. J. Long & Sons, of Bath; Mr. E. J. Trotman acting as clerk of works. The contractors for the electric lighting were Messrs. Edwards & Armstrong, of Bristol. The total cost of the building and site has been about £10,000.

Although the ceremonial opening of the sanatorium has been postponed in the hope that the King or another member of the Royal Family may be induced to be present, patients are already in residence.

Sir Caspar Purdon Clarke, C.I.E., F.R.I.B.A., Director of the Victoria and Albert Museum, South Kensington, who leaves for New York in September to take up the Directorship of the Metropolitan Museum of Fine Art in that city, won the National medallion for architecture at the end of his three years' course and was engaged in the Office of Works, at the Houses of Parliament, and afterwards transferred back again to the Works Department at South Kensington Museum, where, as an assistant architect, he worked not only on the plans of the new buildings but on those of Bethnal Green Museum and of consular and Embassy buildings for the Far East. In 1876 he was made one of the architects for the Royal Commission of the Paris Exhibition in 1878. Later, in addition to his museum duties, he was engaged for the "Fisheries," "Healtheries" and Indian Exhibitions, at the last of which he designed and built the Indian city. The Indian Section of the Paris Exhibition of 1892 was also arranged by him.

NOTTINGHAM ARCHITECTS AND REGISTRATION.

At their last meeting the Nottingham Architectural Society discussed the question of architects' registration.

Mr. A. W. Brewill, F.R.I.B.A., the president, said the Registration Committee of the Institute were getting on very well with the Bill that was being drafted, and as far as possible all points of difference were being eliminated, so that nothing should stand in the way of its passage. If in that manner the thin end of the wedge towards ensuring that all persons practising as architects should be trained and properly qualified men could be got in, all the other matters that they would like to see brought about might follow in due course.

Mr. A. W. S. Cross, F.R.I.B.A. (London), who opened the discussion with the object of eliciting any suggestions that might be likely to prove of assistance to the Committee, freely criticized the work of the Institute, what it had accomplished and where it had failed, particularly in regard to its indifferent attitude to registration, and afterwards emphasized the necessity of the adoption of a Bill which would put a stop to further increase in the number of incompetent practitioners. If such a Bill were to become law, and an effectual and final check were put on the flow of hordes of illiterate and incompetent men who were now overwhelming the legitimate practitioners by sheer force of numbers, the art of architecture would unquestionably benefit. Under a wise scheme of registration the average architect of the future should be a man of sound general education and culture, and as such he would recognize that he was a member of a great and honourable profession. He would know that all unprofessional or dishonest conduct would meet with prompt and exemplary punishment, and, owing to his early associations with many of his fellow practitioners, he would be possessed of what they as a profession sadly lacked, namely, a strong feeling of *esprit de corps;* while although he might show by his designs that he possessed neither great creative power nor originality, yet, on account of his technical scholarship alone, his works would be far more likely to stand the test of time than those produced by an illiterate and imperfectly trained man with, perhaps, far greater natural gifts. The great architects of the future would be men possessing special aptitude for the profession, whose inborn ability had been carefully nurtured and systematically trained, and such men could not fail to produce works of a far higher standard of art than those emanating from the architects of to-day, whose technical training had been obtained, in the majority of cases, in a haphazard and inco-ordinate manner.

Compulsory Examination.

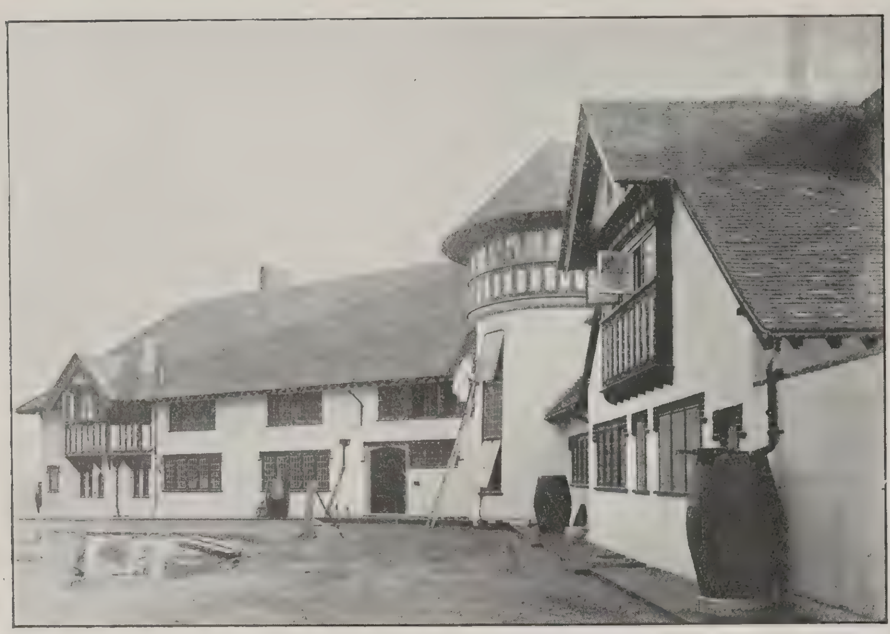
Mr. G. Hubbard, F.R.I.B.A. (London), observed that the necessity of a Bill for the registration of architects must have become apparent to all who had the interest of the profession at heart. It was well known that the profession was constantly being recruited from the untrained and incompetent, and both for the sake of architecture and the properly trained man steps should be taken to foster the one and protect the other. That could only be done by compelling those who aspired to practise to prove their qualification before being allowed to do so. Experience taught them that when the voluntary examination for the associateship of the R.I.B.A. became compulsory in 1882 there was an immediate rise in the number of candidates, and there could be no question of the superior class of men who had joined the Institute and of the superior quality of their works. If they took that as a guide they should feel encouraged to promote in the whole profession a similar state of affairs, for compulsory examination had encouraged candidates to study the art they intended to practise with a great access of competence to themselves and of dignity to the art of architecture. What held good for the few might be fairly assumed to apply equally well to the many; where all were trained, the access of competence and dignity must be in like proportion, and a general application of the principle in their profession would result in a selection of the fittest. The trained architect alone knew how to make his art respond to his impressions, and it ought to be their work to place the profession in the high position it ought to occupy and to induce men of standing and education to join its ranks, so that it might go down to their sons safe from the debasing influences of the ignorant and incompetent. Without statutory qualification, however, it was impossible to carry out those high ideals.

A general discussion followed, during which Mr. A. N. Bromley, F.R.I.B.A., voiced the feeling of the bulk of the members in favour of the general principle of registration; indeed, he remarked, it was difficult to understand why the Institute had been so consistently opposed to it.

The president said that the question had made rapid progress during the past year, and the Bill would have very little real opposition throughout the country, particularly amongst provincial architects, to whom the matter was more vital than to their London brethren.

A resolution was passed supporting registration and hoping that the Institute would prosecute the early adoption of the Bill.

Subsequently the annual dinner of the Society was held.



Entrance Court.

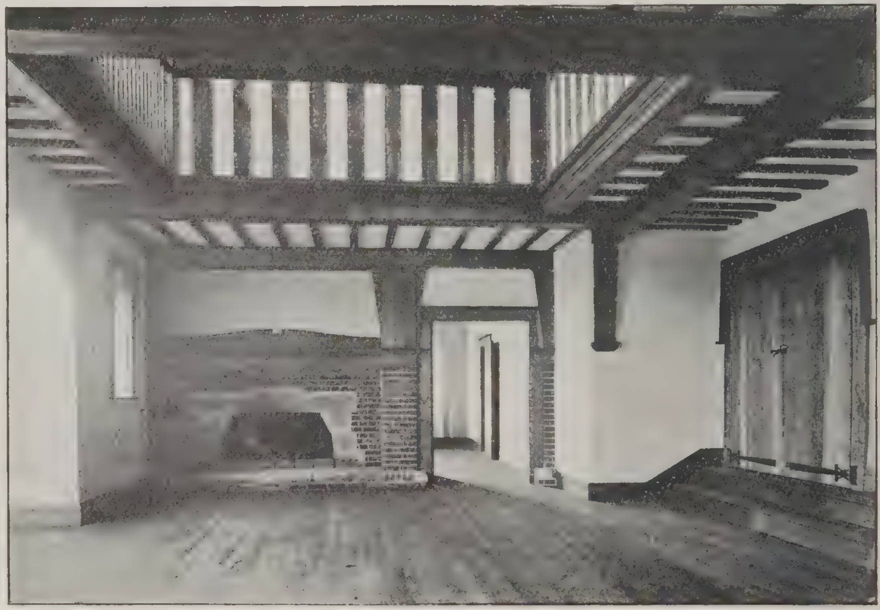
THE GARDEN HOUSE, SALTWOOD.

PARTICULAR interest in this house will be evinced by the fact that it is the outcome of a BUILDERS' JOURNAL competition held some years ago. In that competition the design by Mr. John W. Rhodes, of Mitre Court Chambers, Temple, E.C., was selected, and he was afterwards asked to carry out the work, with numerous alterations to suit the client.

The site commands extensive views over the English Channel from Dungeness to Folkestone. It is about $2\frac{1}{2}$ miles from the sea, and adjoins and overlooks the well-known American garden which is in the same ownership. The new gardens (comprising six acres) are being laid out broadly to the architect's design. Abundance of excellent water was found on the estate, and pumping is effected by a "Petter" oil-engine. The main buildings, stable and outbuildings are all built with selected grizzles, the stone plinth shown to the house in the geometrical drawings (see centre plate) being omitted on the score of economy. All exterior walls are thrice coated with a special limewhite and tallow dressing. The roofs were originally intended to be reed thatched, but the stable only has been covered in this way, old selected tiles taken from demolished houses in Dover being used for the remainder. This necessitated some alterations in the original drawings of roof plans. The principal rooms face south-east and south-west. All the oak doors, architraves, &c., on the ground floor were cut from old mill-posts, the long strap hinges and latches being in wrought-iron. The boudoir is heated by a hanging-basket, and the remaining best rooms by well-fires with stone, red brick or wood mantels. All these fittings are to the architect's special design. The illuminant throughout is acetylene gas, and is most successful. The works have been carried out by Mr. Charles Rice, of East Grinstead, Sussex.

OLD PLASTERWORK IN DUBLIN.

IN the course of a paper on this subject which he read before the recent convention of the Master-Painters' Association of Ireland, Mr. Howard Pentland, B.A., F.R.I.B.A., said he knew of only one example of plasterwork in Dublin in which Wren was concerned, and that was the ceiling of the chapel at the Royal Hospital, Kilmainham, an institution like the Chelsea Hospital, now partially occupied by the Commander



Hall, looking towards Dining-room.

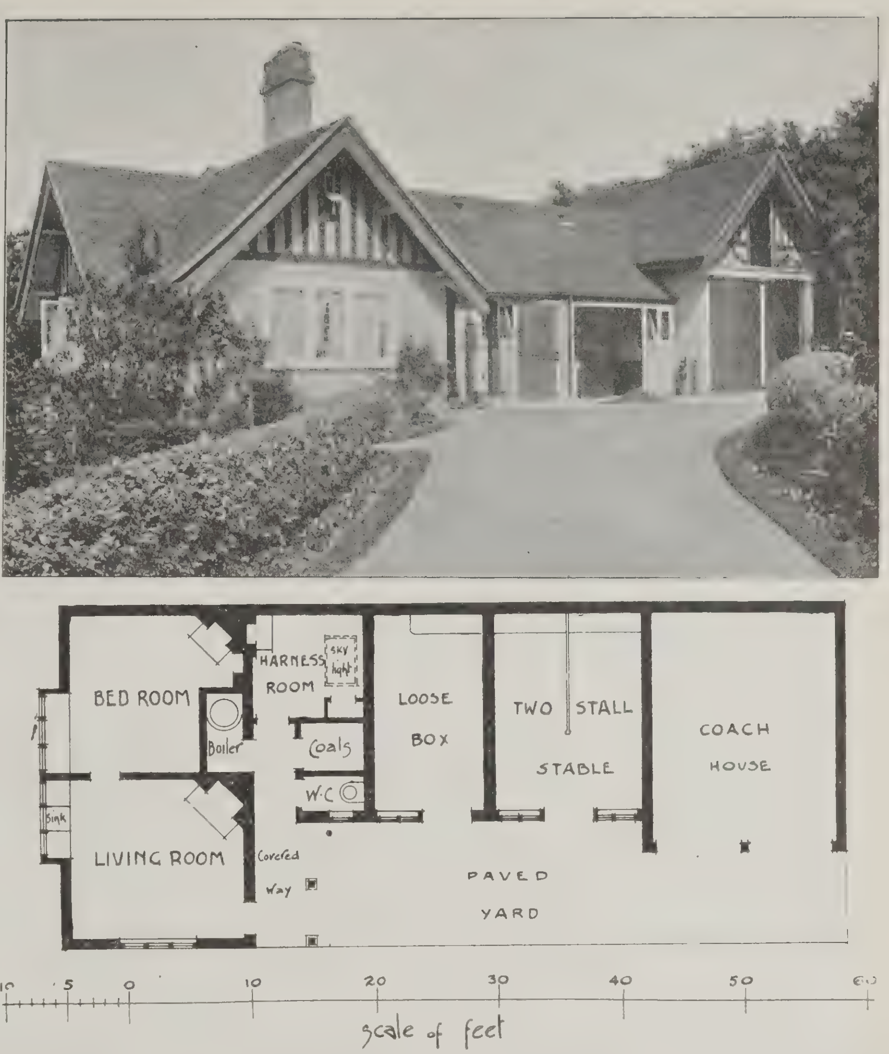
of the Forces and his staff. Gandon, the architect of the Dublin Custom House (commenced in 1781), stated that the design of the Royal Hospital had been attributed to Inigo Jones, but he pointed out that as the latter died in the middle of the seventeenth century, and the Royal Hospital was commenced towards its close, this was rather unlikely. Sir Thomas Drew and the late Mr. Penrose had since ascertained that the design was due to Wren. Sir Christopher did not go to Dublin to superintend the execution, and, as with Sir William Chambers' designs for Trinity College and Charlemont House, there were doubtless many stupid misinterpretations and ill-advised alterations and additions. Still more unlikely was the current belief that the plaster decoration of the ceiling of the chapel was modelled by Cipriani. Cipriani was much more of a painter than a sculptor, and belonged to the latter half of the eighteenth century. In his younger days he did some work for Lord Charlemont at Clontarf, and probably at Charlemont House, and in later years he was associated with Angelica Kauffmann and her husband, Antonio Zucchi, who were largely employed by Robert and James Adam in painting the panels of their ceilings. The modelling of the plaster details was, as a matter of fact, often entrusted to Pergolesi. The ceiling of the chapel at the Royal Hospital was distinctly of the school of Grinling Gibbons and Caius Cibber, full of exuberant, naturally treated, deeply under-cut foliage, fruit and flowers, and as far removed from the enervated modelling which usually set off the panel painting of Cipriani, Kauffmann and Zucchi as it would be possible to imagine. Referring to a ceiling in the house of Mr. David La Touche on Stephen's Green, built in 1794 and occupied for many years by the Representative Church Body, Mr. Pentland said he did not know whether any of the three painted its panels or not, but Angelica Kauffmann painted panels in the house. If Grinling Gibbons had lived till 1794 he would not have done that kind of plasterwork, refined though it undoubtedly was. Rococo influences were now at work, and soon began to show their mark on the freer Palladian treatment of the old Roman acanthus scroll ornamentation which developed out of the leafage around the Corinthian capital. There was an example in plaster in the Stephen's Green Club. It was hard to say whether it was vegetation posing as architecture or architecture posing as vegetation. The style of it was generally known as the pigtail and periwig style.

Mr. Pentland next considered examples of plasterwork at Dublin Castle, comparing the reception-room ceiling with a rather similar rococo ceiling in the celebrated Buck Whaley's house on Stephen's Green, now the Catholic University. Other examples of old plasterwork dealt with by the lecturer were ceilings at a building in the neighbourhood known as La Touche's Bank and now used for official purposes, at 6, Upper Merrion Street, and at Trinity College, Leinster House, Kildare Street, occupied by the Royal Dublin Society. Coming to a "tremendous departure," Mr. Pentland referred to the work done by James Wyatt, the London architect, for the second Duke of Leinster. Wyatt was following in the footsteps of the celebrated Robert and James Adam, and under his direction the "long room" was redecorated in the now popular and fully developed Adam style. This was used as the library of the Royal Dublin Society, but when the National Library was built the plasterwork was carefully scraped and repaired, Wyatt's colouring being followed as closely as possible by Messrs. H. Sibthorpe & Son from some original drawings. Further examples dealt with by the lecturer included staircases, doorways and ceilings from the Rotunda Hospital, chapel and rooms; Drogheda House, Upper Sackville Street, now occupied by the Hibernian Bible Society; Charlemont House, on Rutland Square, the office of the Registrar-General; Mornington House; Clanwilliam House; Ely House, now the residence of Sir Thornley Stoker, M.D.; Belvidere House, No. 6, Denmark Street; and No. 17, St. Stephen's Green.



The brickwork is in hard-burnt grizzles, covered with cement rough-cast, and the roof covered with local tiles. Granolithic paving was laid by Messrs. Ward & Co. Mr. Charles Rice, of East Grinstead, was the contractor. Mr. Rhodes acted in conjunction with the surveyor to the Dorman's estate, Mr. W. C. May.

THE GARDEN HOUSE SALTWOOD: VIEW FROM DRIVE.

Law Cases.

When a Bricklayer is not a Bricklayer.—At the Birmingham County Court last week a bricklayer named Nicholls applied under the Workmen's Compensation Act for compensation from William Bishop, builder, of King's Heath, for the loss of a finger through an accident which occurred while he was engaged in moving a girder on January 2nd. The case for the applicant was that on the Thursday and Friday before the date of the accident the severe weather prevented Nicholls from working as a bricklayer. On the Saturday he went to the works to draw his wages. The foreman met him and said, "Give us a hand with this girder." He did so, and the girder slipped, with the result that his finger was crushed. His honour Judge Whitehorne held that the man's employment was that of a bricklayer, and that there was no evidence to show that the accident arose out of his employment. He therefore dismissed the claim, with costs. But he said he should be glad to have the point settled by a higher Court.

Obituary.

Mr. Alfred Stearn, head of the firm of Messrs. Alfred Stearn & Son, builders, Ipswich, died recently in his seventy-third year. During the last two or three years, however, Mr. Stearn had not taken any active part in the conduct of the business, which has devolved upon his son, Mr. Edward Stearn.

NEW BUILDINGS IN SOUTH AFRICA.

SUPPLEMENTARY to the illustration and particulars of the new town hall and municipal buildings for Durban which we published last week, we now give some views and particulars of other new buildings in South Africa, for which we are also indebted to the "British and South African Export Gazette."

New Railway Stations at Durban and Pietermaritzburg.

The new railway station at Durban has recently been raised from two storeys to its present height and is built of brick and Bath stone; attention is drawn to the fact that the sign-board over the main entrance is no part of the architects' scheme, though by the illustration one might at first sight suppose it were an absolute subjection to the claims of the advertiser! While referring to this building we may state that the same firm of architects designed the new railway station which has just been completed at Pietermaritzburg at a cost of £35,000. In Pietermaritzburg also the erection of a new general post and telegraph office for Natal (from designs by Mr. W. Lucas, selected in competition) is in hand, at an estimated cost of more than £100,000.

Business Premises in Johannesburg.

The accompanying illustrations of the new premises in Johannesburg for Messrs. J. W. Jagger & Co. and Messrs. Eckstein & Co. and the National Bank, Ltd., serve to show the class of buildings which are now being erected in South African towns. Messrs. Jagger's premises were the first to be erected in Johannesburg on the steel frame principle. Messrs. Eckstein's are now being completed and will be opened within the next month or so.

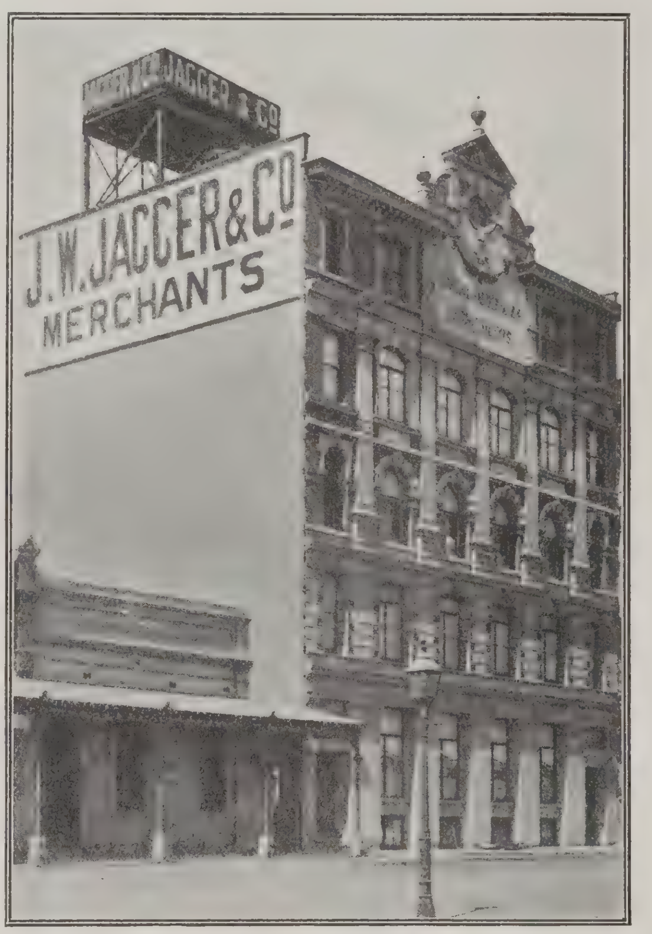
New City Hall and Municipal Buildings, Cape Town.

In Cape Town vast alterations have been made in recent years. Of the numerous buildings now being erected there, the most important is the new city hall and municipal buildings, rapidly approaching completion. The building is Italian Renaissance in style, and consists of three storeys, with a clock-tower and belfry 200ft. in height. It faces the Parade Ground and contains, in addition to the usual municipal offices, a large council-chamber, library, banqueting hall and a grand city hall, the last-named being equipped with a large organ and being capable of accommodating about 6,000 people when necessary. The dimensions of the hall are 130ft. by 62ft. and 55ft. in height. A statue of King Edward VII. is to be erected opposite the main portico. Messrs. H. A. Reid and F. G. Green are the architects. Other public buildings under construction, projected, or only recently finished in Cape Town are the new offices of the Table Bay Harbour Board and Customs House and the Chamber of Commerce in Adderley Street, and the Cape University buildings (overlooking the Botanical Gardens), the design for which, by Mr. W. Hawke, A.R.I.B.A., was illustrated in THE BUILDERS' JOURNAL for May 27th, 1903.

While giving these particulars of new buildings in South Africa we may quote the following interesting remarks from the "British and South African Export Gazette" of January 5th, which also contains portraits and particulars of the leading architects practising in South Africa, a list of whom is here subjoined.

A Revolution in Colonial Building Styles.

Within a few decades a complete revolution has been effected in South African styles of architecture. Less than half a century ago the Dutch type of building—spacious, two-storeyed, flat-roofed, quaintly gabled, with whitewashed or stuccoed front, and the inevitable stoep running along its entire length—prevailed in town and country, alike in the Cape Colony and the Dutch Republics, save where the early Victorian barracklike structure of the merchant firm, and the primitive "tin" shanty of the storekeeper or trader, had gained a footing. Even in Natal the "tin" hut was in general service until the more recent stone building of semi-bungalow type, slightly suggestive of the Orient, became characteristic of the Garden Colony. Now, however, the unpretentious structures of earlier days are rapidly disappearing from the larger centres, and in their place—sometimes, even at Johannesburg, cheek by jowl with their few survivors—stand the palatial public and commercial edifices, the towering steel-frame "sky-scrapers," the imposing churches, and the suburban villas.



THE FIRST STEEL-FRAME BUILDING ERECTED IN JOHANNESBURG.

South Africa's Cosmopolitan Architecture.

It cannot be said that the history of South African architecture constitutes a record of the evolution of type out of type upon a distinct line of development, as has been the case in many of the countries of the Old World. In fact, South Africa—and considering its brief history this is by no means remarkable—has never had a distinctive style of its own, but has adopted, and superimposed upon each other, with very little modification, the national types of its successive inhabitants. Thus the quaint and picturesque Dutch houses became intermingled with the ugly Georgian and early Victorian buildings of the English Colonists, while each of these is being superseded by all that is striking in the very cosmopolitan architecture of the great cities of Europe and America to-day. This latest change is an effect of the sub-continent's close commercial contact with the great manufacturing countries of the world, and of the wonderful growth of its import trade.

The Importation of Bath Stone.

During recent years the South African architect has experienced great difficulty in obtaining suitable materials for his buildings. For years he had to make the best use possible of second-rate locally-made bricks, or, when within moderate distance of a quarry, was able to employ Colonial stone, most varieties of which are very difficult and expensive to work. During recent years, however, the best English stone has been available, notwithstanding transport and other difficulties, and it is being specified by architects more and more freely in spite of the movement afoot in South Africa for the development of the Colonial quarrying industry. The firm which has done pioneer work in the employment of English stone is that of Messrs. Jesse Smith & Sons, of Natal, who were importing Bath stone nearly twenty years ago. It is only, however, within the last ten years that the shipment of this stone has become a regular feature of Anglo-South African trade.

Mr. Alexander Smith, a nephew of the original Jesse Smith, says the average cost of Colonial stone is about 4s. per cub. ft., whereas he can land Bath stone at Cape Town or Durban for 3s. 4d. and less.

The difficulties which make it more profitable to carry stone like this over 7,000 miles are—the lack of railway transport from the South African quarries, and the trouble involved in working the local stone, which is largely granite and sandstone, and so hard that it cannot be sawn by Kaffir labourers (as Bath stone can) but must be carefully worked by a skilled white man. Further, the great delays and uncertainty of obtaining regular and prompt supplies of stone from the quarries is often a very serious and costly matter to contractors employing, perhaps, twenty to thirty masons at wages of 15s. to 20s. per day. "The consequence is," says Mr. Smith, "that, in addition to being obtained at less first cost than the South African, English stone also involves an economy of nearly 50 per cent. in working expenses."

South African Architects.

The leading architects now practising in South Africa are:—*In Cape Colony:* Mr. F. G. Green, A.R.I.B.A., Mr. W. White-Cooper, M.A., F.R.I.B.A., Messrs. MacGillivray & Grant, Mr. C. H. Smith, A.R.I.B.A., Mr. M. J. Harris, M.S.A., Messrs. W. H. P. Black, F.R.I.B.A., and H. Black, A.R.I.B.A. *In Natal:* Messrs. Read & Hurst, Mr. W. Lucas F.R.G.S., F.R.V.I.A., Messrs. C. H. Stott, M.S.A., & R. G. Kirkby, A.R.I.B.A., Mr. Robert S. Clark-Walker, C.E., and Mr. Robert Harvey. *Transvaal:* Mr. H. A. Reid, M.S.A., J.P., Mr. H. Clayton, M.S.A., Messrs. A. H. Reid, F.R.I.B.A., & W. Reid, Mr. Redcote Dewar, Messrs. A. L. & A. Klute, Mr. A. E. Duguid, Mr. David Ross, F.R.I.B.A., Mr. J. Innes Murray, Mr. A. Phipps Coles, M.S.A., Mr. S. D. Le Roux, and Messrs. W. A. de Rapper & Son.

Members of the profession here will doubtless be interested in looking over the above list, among which will be found many names familiar to them, for most of the architects now practising in South Africa went out from this country.

THE ARCHITECTURAL ASSOCIATION.

Two Papers on Byzantine Architecture.

A MEETING of the Architectural Association was held at 18, Tufton Street, Westminster, on Friday evening, Mr. E. Guy Dawber, F.R.I.B.A., presiding.

Messrs. J. K. Ground (Maidstone), S. A. Whitehead (Sidcup), R. M. Kelly (East Sheen), H. D. Ward (Grays) and H. E. Bunce (Upper Clapton) were elected members of the Association. It was announced that Mr. Christopher M. Shiner, Mr. Ellis Marsland, Mr. Cyril E. Power and Mr. C. S. Yates had rejoined the Association.

The president stated that the following additional donations to the Building Fund had been received :—

	£	s.	d.
Charles Morrison - -	100	0	0
Walter Cave -	10	10	0
A. Potter - -	10	0	0
W. Bagaley & Sons	5	5	0

Alfred East, A.R.A. - -	1	1	0
Higlett & Hammond - -	1	1	0
F. J. Lloyd - -	1	1	0
J. R. Moore-Smith - -	1	1	0

A vote of condolence with the widow and relatives of the late Mr. Thomas Blashill was passed.

Papers on Byzantine architecture (illustrated by numerous excellent drawings and photographs, and by lantern slides) were then read by Mr. J. B. Fulton and Mr. E. F. Reynolds.

Mr. Fulton's Paper.

Mr. Fulton said it would be an interesting study to trace the influence of early Roman building down to the Byzantine period. The nfluence was evident, as the architects must have visited Rome and there studied the great temples and baths; but the Romans, with all their power of knowledge in construction and imagination in design, could never have built Santa Sophia.

Mr. Fulton said he wished to show some examples of Byzantine architecture — examples well-known but not one-half appreciated, as we did not fully realize the beauty and truth of construction in this style.

Examples at Constantinople.

At Constantinople there were the churches of SS. Sergius and Bacchus; S. Theodore, Tyrone; S. Theodosia (now Gul-Jami); and the church of the Monastery of the Chora (now Kahriych Jami)—and the great Santa Sophia.

Originally there were two churches of SS. Sergius and Bacchus. "The existing one is a gem and is in a wonderful state of preservation. The dome is supported by eight piers, the arches forming an octagon, but below the arches the angle sides of the octagon are semi-circular recessed, and it is these recesses which give to the interior such a charm."

S. Theodore, Tyrone, Mr. Fulton considered unworthy of the best traditions of the style, as although the façade in itself was good, the plan was false, being that of a Greek cross. The columns supporting the dome seemed rather weak.

The plan of S. Theodosia was interesting; the whole effect of the interior was achieved by form, there being no detail.

The façade of the church of the Monastery of the Chora was thought to have served as a model for St. Mark's, Venice. The glory of this church was its decoration. There we saw what the Byzantine architects were aiming at—true architecture, which meant the unity of the three arts. Constantinople was well worth a visit to see these mosaics alone, even though they had suffered by fire and earthquakes. The figure of St. George in the outer narthex, said Mr. Fulton, was undoubtedly the finest study in mosaic that he had ever seen.

In SS. Sergius and Bacchus we saw the germ of the Byzantine style; in Santa Sophia the idea fully developed. It was said the exterior of Santa Sophia possessed little architectural beauty, and he thought this impression was due to the stucco with which the original material was covered: he suggested taking away the stucco, the minerets, buttresses and innumerable small Turkish buildings, which were out of harmony with the main building. "Now look at the design with all these removed, see the great buttresses, the arch between, the semi-domes and great dome rising from the square base. Is it not a magnificent pile?" The passion and mystery was marvellous. No other building could compare with Santa Sophia in beauty, fine proportion and delicate detail.

Examples in Palestine, Asia Minor, Greece and Italy.

Continuing, Mr. Fulton dealt with churches in Palestine, Asia Minor, Greece and Italy.

St. Mary's Church in Bethlehem was one of the earliest Byzantine churches known. The Golden Gate, Jerusalem, was also in this style, but no part of it called for special attention.

In Brusa there were interesting details, such as panels, capitals, &c., but nothing of special note.

Athens had quite a number of Byzantine churches, all comparatively small though interesting. Byzantine churches, in fact, were scattered all over Greece. He mentioned two – the Convent of Daphni, situated about five miles from Athens on the Sacred Way; and St. Luke's, Stiris, which was almost perfect in its general design, lighting and decoration.

In Italy Byzantine art reached a high state of perfection, the glory of the art being St. Mark's, Venice. Its interior could not compare with Santa Sophia, but the façade was the finest example of an exterior in Byzantine art. The Gothic addition in the fifteenth century might have been better; as fine architecture it was not to be compared with the Byzantine building.

Mr. Fulton said he had seen and knew but little of Byzantine domestic architecture. The Palace of Belisarius, Constantinople, was a magnificent example—a decorative study in stone and brick.

Mr. Reynolds's Paper.

Mr. E. F. Reynolds said the founding of Constantinople was sometimes regarded as the starting-point of Byzantine art, but such arbitrary divisions were always misleading, if not altogether untrue. The removal of the capital from Rome to Constantinople doubtless exercised a very deep influence, and the energy of building which it called forth must have quickened architectural development, but it was strictly a development and no sudden change of style. It was historically certain that the new capital was intended by its founder to be a direct continuation of the traditions of the old capital. In the Edict of Dedication its title was "the New Rome"; the general design of the city followed the Roman model, with its forum, its circus, its basilicas, baths and porticos; and its population was drawn from other cities of the empire, and especially from Rome itself. Thus, both by intention and circumstance, Constantinople was essentially Roman in its foundation. But there were also many influences which in their working could not fail to modify this tradition and prevent a mere reproduction of Roman art. The most formative of these were (1) the renewed ascendency of the native Greek genius, (2) the more direct communication with Oriental influence, and (3) the unrestrained play of the new force of the Christian religion.

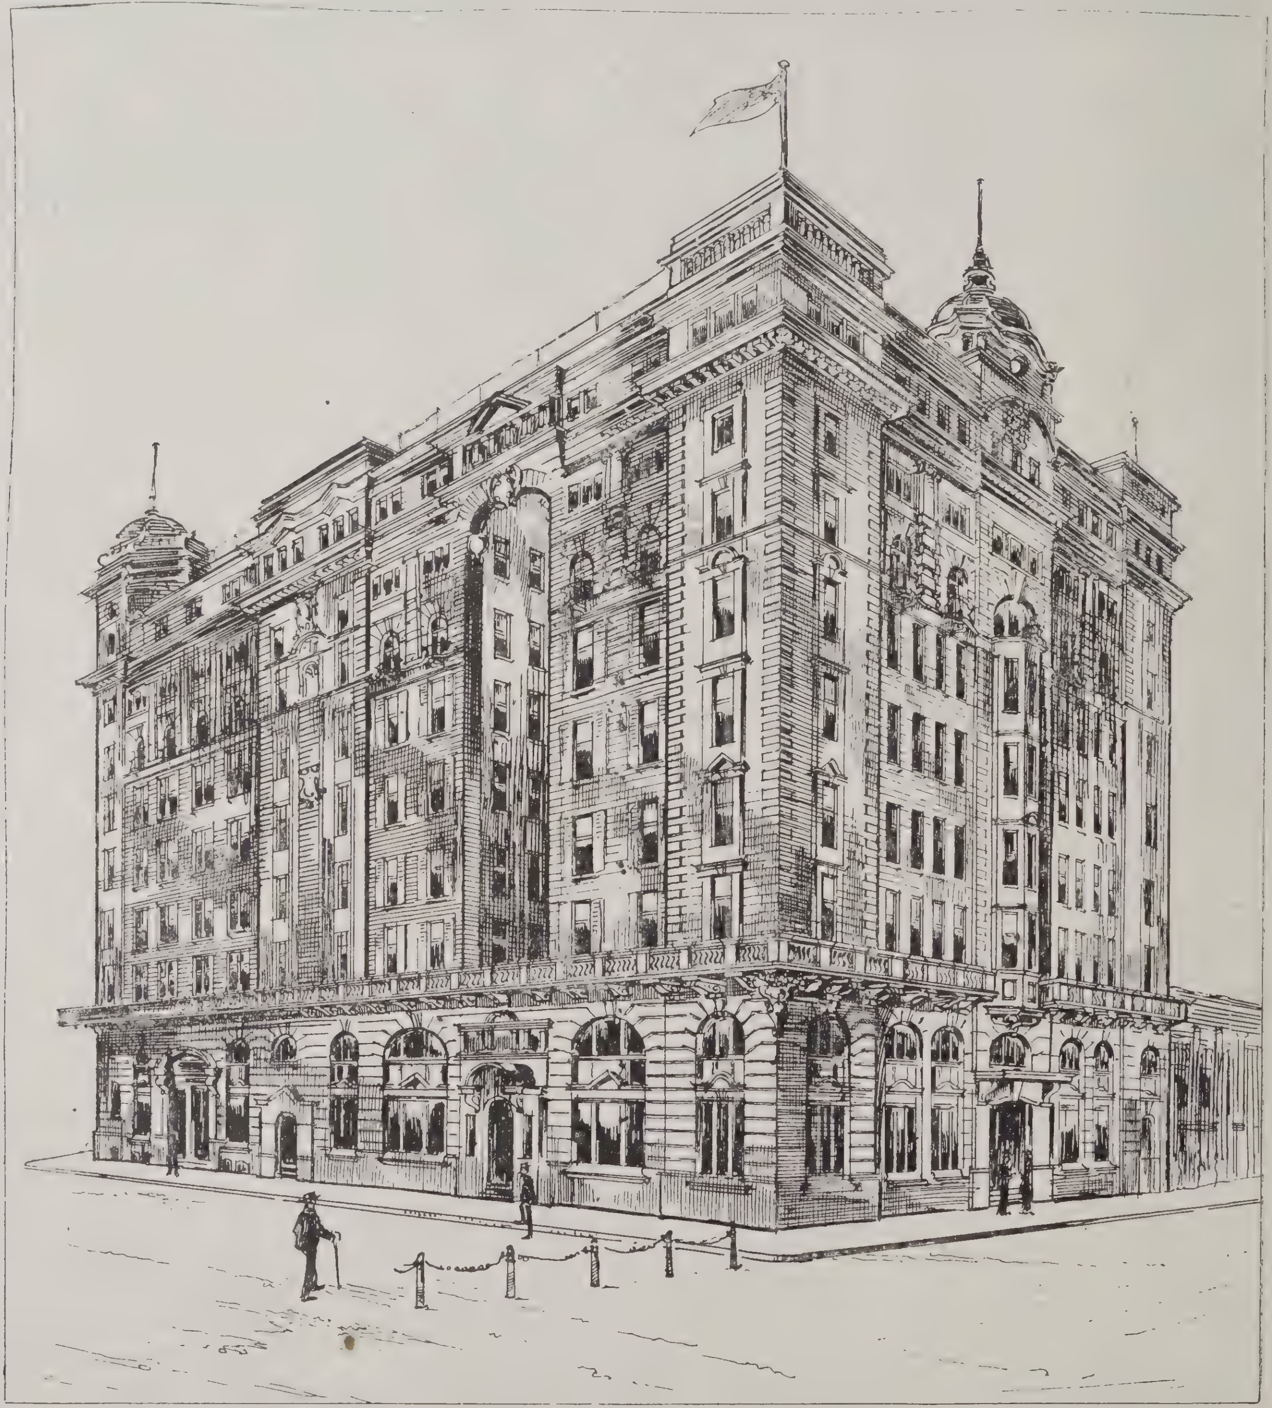
Roman Building and Greek Genius.

The Romans had largely borrowed their decorative art from the Greeks, but an inverse process was now to take place, for while the Byzantines developed that system of constructive design which had formed the real vitality of Roman work, they modified and eventually discarded the unrelated decorative design which had obscured the structural conception. Under Greek discrimination the vital principles of Roman building were disengaged and purified, and decoration was once more brought into intimate relation with structural design.

Eastern Influences.

By the removal of the capital, contact was also established with a more direct Oriental influence. The East had always been the natural home of the vault and the dome, and it was there that the origin of these methods of covering was to be sought. To this Eastern influence, which flowed to Constantinople along the great trade routes, might be attributed that freedom in the use of vault and dome which formed so integral a part of Byzantine design. Moreover, the Byzantine method of vault construction was similar to the Oriental method, the courses being laid with inclined beds and independent of centering, while the Roman construction of ribs and shell was essentially different.

This influence also filtered through Asia Minor, where a local school had already established itself, experimenting with new combinations of plan-form and arriving at the principle of the pendentive. Even the Imperial Roman buildings at Baalbec and Palmyra showed something of the same tendency to break away from the academic style in the substitution of the arch for the lintel, and in freshness of decoration. It seemed as though the meeting-place of



PREMISES FOR MESSRS. ECKSTEIN & CO. AND THE NATIONAL BANK OF SOUTH AFRICA, JOHANNESBURG.

Greek and Oriental formed a kind of hot-bed which fostered the early growth of many forms which afterwards became typically Byzantine.

Changes wrought by Christianity.

Christianity was recognized as the State religion only a short time before the foundation of the new capital, and it was at Constantinople that it found full force of expression. It brought a new inspiration to building, needing fresh forms specially adapted to its ritual and a new mode of decoration explanatory and symbolical of its creed. The perfunctory worship and comparatively insignificant temples of the Roman mythology gave place to an ardent and enthusiastic religion which penetrated and revitalized all the arts. Roman art had in reality been almost purely secular, and its most characteristic monuments had been the fora, the theatres, the baths and, above all, the great works of engineering. But from the rise of Christianity religious building again assumed the lead, and although this was now unduly emphasized by the better preservation of such works, yet there could be no doubt that the prime energy of the Byzantines was devoted to their churches.

These, then, were some of the main factors which determined the difference between Roman and Byzantine work.

Later Development.

Following the new foundation there was a period of 200 years' growth and formation, culminating with the erection of Santa Sophia. The precise course of development during this period could be only imperfectly known owing to the destruction of so many ntermediate buildings. Constantinople had especially suffered from the violence of its earthquakes and the still greater violence of ts riots. But phases which were missing here might sometimes be found in such affiliated centres as Ravenna and Salonica, while a comparison of the developed Byzanine forms with the embryo ideas of late Roman work often suggested the source from which that development sprang.

Plan-Forms of Santa Sophia.

Mr. Reynolds proceeded to give a study of he plan-forms of Santa Sophia, tracing some of the earlier forms from which they seemed o have been derived. The uniqueness and originality of the church lay in the combination of two types of plan which hitherto had been developed more or less separately. These might be distinguished by the terms “basilican” and “radial,” the basilican type being founded on a repetition of bays in length, the radial type being founded on a epetition of bays around a common centre, producing circular or polygonal figures. The ssential parts of the scheme of Santa Sophia were (1) a central square bay, defined by our arches set on piers and covered with a ome on pendentives, and (2) two complex pses, applied to opposite sides of the central quare and regulated by its arches. Of these wo principal parts, the first might be traced o a basilican origin and the second might e derived from the radial type of plan.

The Roman Use of Domes.

The Romans had always applied the dome o circular or octagonal ground plans, and nly in the latter case was any transition f plan-form necessary. In the baths of aracalla there was an instance of an ctagonal hall covered with a circular dome, nd the transition was made by means of orbelling, which formed a slight pendentive; ut the full development of the pendentive as essentially Byzantine, and seemed to ave originated in the East rather than the West.

Spherical Vaults.

The spherical vault—such as that used in he tomb of Galla Placidia at Ravenna—as intimately related to the dome set on endentives, but it afforded no opportunity admitting light, and in buildings of a larger scale this led to the raising of the upper part of the vault so as to form a separate dome, and eventually to the raising of the dome itself on a drum.

The Greek Cross.

Plans in the form of a Greek cross naturally resulted from the use of a central square bay set on arches, the arms of the cross representing the depth of abutment necessary to those arches; and the generalized form of plan was of very early origin and of almost universal use. The Romans were familiar with it, and it was supposed that its Persian tradition was imported in the cruciform mosques of Cairo. This type of the Greek cross formed a most important chapter in the history of Byzantine planning; for with the application of the dome to the central square the constructional meaning of the plan was extended to the vaulting, the barrel-vaults over the arms providing abutment to the thrust of the dome.

In dealing with the radial type of plan Mr. Reynolds said

The Pantheon of Rome

might be taken as a convenient starting-point. The structure consisted of a great spherical dome set on a circular drum, and the arrangements for supporting the weight of the dome and abutting its thrust contained the germs of many principles which were afterwards developed by the Byzantines. The wall of the drum was of great thickness, in order to oppose its depth against the spreading of the dome; but the weight and thrust were concentrated at regular intervals, so that the structure of the drum was not continuous but grouped into piers and connecting walls, giving a series of recesses between the piers. The compound wall of the Pantheon represented an intermediate phase between the simple wall of the circular cella and the later development of aisles.

A further Link

was furnished in the so-called Temple of Minerva Medica. Here the articulation of the drum-wall into voids and solids was more perfectly attained, the sides of the octagon being deeply recessed into apsidal chambers or exedræ. Above this lower octofoil stage an octagonal drum was raised, pierced with clearstory windows and strengthened with buttresses, the dome springing above the arches of the clearstory, and the drum-wall being carried up externally. In this instance the semi-circular chambers were separate from one another, and the next step was to connect them together by openings through the bases of the buttresses—thus forming abutment-aisles similar to those which had already been developed in the basilican plan. This was virtually effected in S. Vitale at Ravenna, where the plan-form of Minerva Medica was repeated and surrounded by an aisle, the exedræ being converted into arcades so as to open aisles and octagon into one area.

Thrusts of Dome and Octagon.

But it was necessary to differentiate between the thrust of the dome (which required continuous abutment) and the thrust of the arcaded octagon (which required abutment only at its angles). The function of the aisles in S. Vitale was to sustain the outward pressure of the eight arches which supported the weight of the dome, and to give rigidity to its base. But the actual thrust of the dome was met by the same method as was used in the Pantheon, *i.e.*, by the carrying up of the drum-wall above the springing, thus absorbing the thrust by vertical weight instead of by horizontal abutment.

Santa Sophia and S. Sergius.

Returning again to the plan of Santa Sophia, Mr. Reynolds said it was at once evident that the elaboration of the apses was directly derived from such a design as the church of S. Sergius. There was the same alternation of curved and rectangular forms, the same arrangement of arcading in two heights; and Santa Sophia had more than once been described as the two halves of S. Sergius separated by a central square.

But in adapting the forms of S. Sergius to the apses of Santa Sophia several alterations were made: firstly, the three bays were disposed around a semi-circle, so that no modification of plan was necessary to pass upwards to the semi-dome; secondly, the semi-domes of the apses were not placed above the arch-heads of the three bays, but sprang from the same level and were interpenetrated by them. The reason of this last modification lay in the very different scale of the two churches. S. Sergius was a comparatively small building, and the abutment of its dome was sufficiently secured by the weight of wall carried above the springing and by the buttresses applied to that wall; but the apses of Santa Sophia were tremendous constructions of 103ft. diameter, and the same methods would have been a clumsy expedient on so great a scale. The interpenetration with the lesser semi-domes and barrel-vault of the three bays gave efficient abutment to the great semi-domes at the critical point of their curvature, and, furthermore, reduced their weight. This ingenious distribution of thrust was typical of the whole design of the domes and vaults, and the thrust of the main dome itself was expended through the great semi-domes, the lesser semi-domes, and through the vaults of the aisles to the outer walls.

The Final Combination of Basilican and Radial Plans.

Having thus dealt with the two essential parts which made up the main scheme of Santa Sophia—the central square-domed compartment derived from the basilican plan and the two compound apses derived from the radial type of plan—it remained for Mr. Reynolds to speak of the adjustments necessary to their combination. In Santa Sophia the arms of the cross were developed to the north and south by the great buttresses which passed over the aisles and sustained the east and west arches of the central square; but the completion of the figure by similar extensions to the east and west was rendered impossible, owing to the application of the apses with their deeply-curved exedræ. Hence arose the necessity of mainly absorbing the thrust of the north and south arches within the central square itself, and this was effected by the insertion of an inner arch on each of these two sides. These inserted arches carried the main weight of the dome above, while the original square was still recognized by breaks of 3ft. which, to some degree, were decorative rather than constructional.

Discussion.

A discussion followed in which Mr. R. Phené Spiers, Prof. W. R. Lethaby, Mr. R. Weir Schultz, Mr. Theodore Fyfe, Mr. Dawber and Mr. Fulton took part.

The president announced that the next meeting would be held on February 10th, when Mr. C. S. Spooner would read a paper on "Church Fittings."

The Municipal Engineer's Specification No. 1.—The Proprietors regret the delay in the first issue of this new annual publication, owing to the difficulty of obtaining the delivery of articles commissioned, and also to the necessity of very careful research and verification in the preparation of such a work. In the division on Roads contributions and particulars have been received from over 300 engineers, and the many valuable tables and statistics in connection with this subject occupy from thirty to forty pages alone. The Proprietors hope to announce shortly the date of publication, for the delay of which they feel assured that the increased value and authoritativeness of the volume will be ample compensation.

THE LATE THOMAS BLASHILL.

THOSE who enjoyed the friendship of the late Mr. Thomas Blashill—and they are many in all classes of life—have very real cause to mourn his sudden death on Friday morning, January 20th, for he was seen out of doors on the previous Tuesday. The funeral service took place at St. Pancras Church, Euston Road (of which he was one of the wardens), and he was laid to rest at Highgate on Tuesday, January 24th, in the presence of a large number of his old and faithful colleagues. Among many others observable at church or cemetery may be mentioned Messrs. J. W. Penfold, S. Flint Clarkson, Rowland Plumbe, A. O. Collard, John Slater, E. W. Riley, Andrew Young, John Briggs, Dr. Longstaff, Ernest Hutton, E. Guy Dawber, Louis Ambler, D. G. Driver, Max Clarke, E. O. Sachs and Hugh Stannus.

Mr. Blashill was a man of more than usual strong vitality, to which his robust Yorkshire constitution and early life spent in the country no doubt contributed. His activities found scope in many diverse quarters, and wherever he applied his abilities his friends were impressed with the kindness of heart, candour of opinion and the common-sense nature of his views and advice on all subjects. He was particularly helpful and accessible to younger men, who were constantly seeking his kindly assistance in various ways. As an architect he did a considerable amount of good work in London and the provinces, and as a younger man he was an excellent draughtsman and watercolourist. He was born at Sutton-in-Holderness seventy-four years ago, and was apprenticed to an uncle in Herefordshire. He came on a visit to London in 1854, and within three days of his arrival he was introduced to Mr. J. W. Penfold, who advised him to remain here for a time and found him an engagement in the office of Mr. T. E. Knightley. Colonel Haywood, engineer to the City Commissioners of Sewers, was an early friend, and it was through him that Mr. Blashill became responsible for the designs of new buildings erected in connection with the Holborn Viaduct Improvement. He joined Mr. Ainslie in practice in Old Jewry Chambers, and was afterwards in partnership with Colonel Haywood's brother Henry. In 1862-63 he became president of the Architectural Association, an Associate of the R.I.B.A. in 1866, a Fellow in 1877, and he was on the Council for several years. He was at one time district surveyor of Bethnal Green East and South Bow, and afterwards of West Hampstead; he was a Fellow of the Surveyors' Institution and of the Zoological Society; a member of the British Archæological Association, of the Woolhope Naturalists Field Club, Master of the Framework Knitters Company, examiner for the Borough of Battersea Technical Institute, a member of the St. Pancras Borough Council, and at various times filled other important and useful positions. He was, too, a popular member of the Honourable Artillery Company and of the Fitzroy Lodge of Freemasons.

In 1887 he was appointed superintending architect to the Metropolitan Board of Works, his private practice being taken over by Mr. A. O. Collard, one of his old pupils. His services were retained by the London County Council when the change in municipal government took place, and on his retirement from public office everyone in any way connected with building in London lost a sympathetic friend. In that official position his services and loyalty were fully recognized by the chairmen of the Building Act Committee—Mr. William Shepherd, Sir John Hutton, Dr. Longstaff, the Hon. Alan de Tatton Egerton and Mr. William Davies.

To those who were intimate with him Thomas Blashill was a constant friend, and in social and professional circles his loss has been severely felt.

Builders' Notes.

Dissolution of Partnership.—Messrs. G. M. Kerry & Co., builders and contractors, of Nottingham, have dissolved partnership.

The Glass Trade in 1904 was only moderately good as compared with previous years, but it seems to have opened rather better this year, and the trade is hoping for a greater improvement and development.

Mr. William Watt, of Messrs. George Fordyce & Co., builders, Aberdeen, has been presented with a gold watch and other gifts by his friends in the building trade, and others, on the occasion of his retirement from business.

Infringing the By-laws.—Frederick Elliott was fined £1 and 10s. costs at the Handsworth Police Court last week for erecting a house with wood hearths instead of concrete, without having a window in the drawing-room letting on to the street or other open space, and for failing to comply with the by-laws in other particulars.

Leeds Corporation and the Colsterdale Reservoir.—The Waterworks Committee of the Leeds Corporation have decided in favour of the Colsterdale reservoir in the Ure Valley being constructed by outside contract. In September last contractors were invited to send in tenders, and there was a disposition to recommend the City Council to accept the tender of a private firm, amounting to about £300,000. Labour representatives in the city, however, raised the question of the unemployed. A petition was presented, and a report from Mr. Charles Hawkesley (of the firm of Messrs. T. Hawkesley & Sons), in view of which, and other matters, it was resolved to ask some of the contractors to revise their tenders. A further resolution was passed to advertise for a waterworks engineer. The estimated cost of the Ure Valley water scheme, from start to finish, will be £2,200,000, including pipe-laying. The plans show four reservoirs, namely, Colsterdale, Leighton, Carlesmoor and Laverton, with a capacity of 4,543 million gallons and a daily yield of 15½ million gallons. The sites of the Colsterdale and Leighton dams are in the Burn Valley, while the Carlesmoor and Laverton reservoirs will be built in the Valley of the Laver. The Colsterdale reservoir is the largest of the series. It will cover 170 acres and will have a capacity of 1,852 million gallons.

Harrow Hill saved from the Builder.—Nearly 250 acres of land on the east side of Harrow Hill are to be purchased for the school at a cost of £75,000. It will be necessary, however, to leave a large amount of the purchase money on mortgage.

Edinburgh and Leith Districts Building Employers' and Allied Trades' Association.—At the thirty-third annual general meeting, held last week, the chairman (Councillor Macleod) commented on the dull state of trade during the past year and the very large number of men unemployed. For the ensuing year Mr. James Forrest was elected chairman.

First Garden City and the Unemployed.—The £2,000 required to permit the employment of 200 men at the First Garden City, near Hitchin, for three months has been more than subscribed, and the construction of dormitories, &c., for the accommodation of 300 men from the beginning of February to the end of April has been authorized.

Northamptonshire Brick Trade Depressed.—The brickmaking trade in Northamptonshire is in a very depressed condition, and while all the works at Fletton (near Peterborough) have considerably reduced their output, it is probable some will close down altogether. The price of bricks has fallen from 30s. per 1,000 to 12s. For the time being the trade is utterly paralysed, and one firm alone has 7,000,000 bricks stacked.

Messrs. Patman & Fotheringham, Ltd. (Mr. James F. Parker, managing director), builders and contractors, of 100 and 102, Theobald's Road, London, W.C., and Park Street, Islington, N., &c., have just secured a large contract for the Gunnery College additions and alterations on Whale Island, Portsmouth, for the Admiralty. These works have to be carried out in a very short time. Messrs. Patman & Fotheringham recently completed the London Coliseum.

British Standard Tables for Pipe Flanges have just been issued by the Engineering Standards Committee (28, Victoria Street, S.W.), price 2s. 6d. nett. The Committee recommend that there be four standards, namely, low-pressure standard (for steam pressures up to 55 lbs. and water pressures up to 200 lbs. per sq. in.); intermediate pressure-standard (for steam pressures between 55 lbs. and 125 lbs.); high-pressure standard (for steam pressures between 125 lbs. and 225 lbs.); and extra high-pressure standard (for steam pressures between 225 lbs. and 325 lbs.).

MR. REGINALD BLOMFIELD, A.R.A.

MR. REGINALD BLOMFIELD, who was elected an A.R.A. last week, is the grandson of the well-known Dr. Blomfield, Bishop of London, and nephew of the late Sir Arthur Blomfield, A.R.A., architect to the Bank of England. He was educated at Haileybury and Oxford, and at the architectural school of the Royal Academy, where he gained several prizes. He has chiefly devoted himself to domestic architecture, and has designed a large number of country houses during the past twenty years, including Brocklesby Park, Caythorpe Court, Meltham Hall, Heathfield Park and Holbrook House. He is an authority on Renaissance architecture, and has written a history of its development in England, published three o four years ago. Mr. Blomfield has also written on "The Formal Garden in England," and has designed and arranged gardens for the Earl of Yarborough and other landowners. A few years ago he designed a processiona cross for St. Paul's Cathedral, and his also was the design of the South African Wa Memorial erected at Haileybury College. He is the architect to the Army and Navy Society.

Enquiries Answered.

he services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

uestions should in all cases be addressed to the Editor and be written on one side of the paper only.

orrespondents are particularly requested to be as brief as possible.

he querist's name and address must always be given, not necessarily for publication.

Examinations.

G. H. writes: "I wish to enter for some aminations that would be beneficial to me after-life. I have served 5½ years in rious offices, four years in an architect d surveyor's office, then occupying a sition as surveyor, &c., on an estate. What you advise?"

We think the best examinations you could in for, considering the fact that you have d experience as a surveyor, would be those the Surveyors' Institution. The address of e secretary is—George Street, Westminster.

Decorative Plasterwork.

AYR.—AILSA writes: "Is there any way of eparing plaster either on a strapped wall on a rendered wall so that a decorative nel may be painted in oil direct on the aster, which would be rough (left off the at) to give texture, and so that the painting ay be done, say, a week or two after the aster is pronounced to be dry? Also, is ere any way of colouring plaster by mixing louring matter with it so as to form a ckground for a sort of cartoon effect? In is way the texture would be retained, and would be more effective than applying a background coat of paint."

(1) The plaster should be dry before paint is put on. This might be done quickly by drying out with coke fires. The usual method where work is required to be painted quickly is to use fibrous plaster, which, being in thin sheets, can be dried out in front of coke fires. (2) Powdered colouring matters can be mixed with the plaster to gain any tint.

"Yotto" Gas Burners.

LEYTONSTONE.—A WEEKLY SUBSCRIBER writes: "Who is the London manufacturer or agent for 'Yotto' chimneyless incandescent burners?"

Messrs. Young & Marten, Ltd., of Caledonian Works, Stratford, E., are the London agents.

Buildings to Measure around Barnet.

NEW BARNET.—W. writes: "Please name some buildings near Barnet that would be suitable to measure for the R.I.B.A. final examination."

If permission could be obtained from Lord Salisbury to do so, nothing could be better than to measure part of Hatfield House, which is within easy reach of Barnet by rail. Failing this, Waltham Cross or part (say a bay of the nave arcade) of Waltham Abbey would be suitable, being within a bicycle ride; as also is St. Albans Abbey, though it has been so completely altered in restoration that there is little left worth studying. G. A. T. M.

Strength of Brackets on Cast-iron Columns.

CLEVEDON.—H. T. writes: "What load may safely be put on the cast-iron brackets marked X on the accompanying sketch?"

The pockets or brackets shown by Fig. 1 and Fig. 2 are, in themselves, amply strong enough for any load that can be put upon them by the timbers, but their connection with the column is weak and fracture might occur through A A (Fig. 4). If the 12×4 timber fits closely, and 1¼in. bolts are put through the cheeks on each side of the cross timbers, as shown in Fig. 1 and Fig. 2, they will no doubt be secure; but if an alteration can be made in the design, as in Fig. 3, the column will be safer. It will be seen that internal curves are put in the bottom of the box, the neckings placed lower and the brackets made longer. The calculation of strength of the original design without the bolts would be as follows:—The section of possible fracture would be as Fig. 4 and Fig. 5, but the tension part, 16ins. by 1¼ins., would be inherently weak from the square angle inside the box causing a defective arrangement of the crystals in the cooling of the casting, and the maximum safe load could not be considered more than ½ ton = 1,120 lbs. to the square inch. The centre of gravity of fracture surface would be

$$\frac{16 \times 1{\cdot}25 \times {\cdot}625 + 2{\cdot}375 \times {\cdot}75(1{\cdot}1875 + 1{\cdot}25)}{16 \times 1{\cdot}25 + 2{\cdot}375 \times {\cdot}75} = \frac{12{\cdot}5 + 4{\cdot}113}{20 + 1{\cdot}78} = \frac{16{\cdot}613}{21{\cdot}78} = {\cdot}763 \text{ ins.}$$

The moment of inertia of the section would be

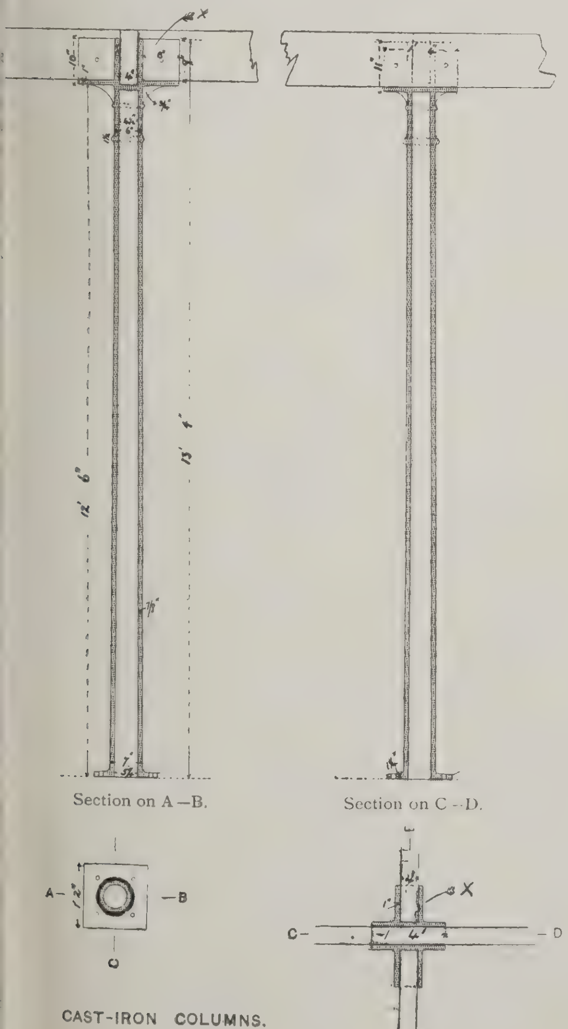
$$\frac{{\cdot}75(1{\cdot}25 + 2{\cdot}375)^3 + (16 - {\cdot}75)125^3}{12} = \frac{35{\cdot}73 + 29{\cdot}78}{12} = 5{\cdot}46 \text{ in. units,}$$

and the modulus of section would be

$$\frac{5{\cdot}46}{2{\cdot}375 + 1{\cdot}25 - {\cdot}763} = \frac{5{\cdot}46}{2{\cdot}862} = 1{\cdot}908 \text{ in. units.}$$

Then the moment of resistance $zc = 1{\cdot}908 \times 1120 = 2{,}137$ lb.-ins., and the bending moment will be $w\,(4{\cdot}3) = 4{\cdot}3\,w$. Then as the bending moment must equal the moment of resistance, $4{\cdot}3\,w = 2137$, whence $w = \frac{2137}{4{\cdot}3}$ = say 500 lbs. This of course is only approximate, as the mode in which the cross-beams bear in the sockets will greatly influence the result. It is assumed in the calculation that they rest equally over the whole bearing surface.

HENRY ADAMS.



Section on A—B.

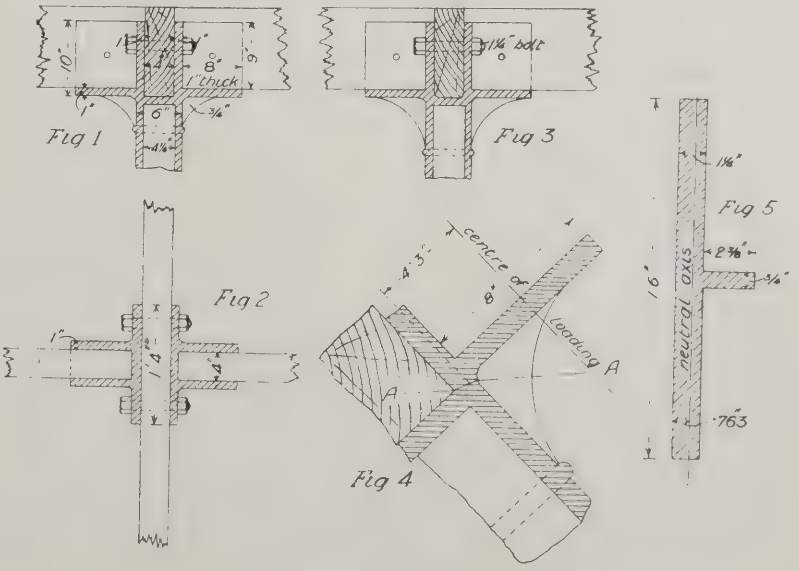
Section on C—D.

CAST-IRON COLUMNS.

"Tarmac."

OGMORE VALE.—W. T. J. writes: "On p. 301 of your issue for December 7th last a report was given of a paper read before the Automobile Club by Mr. Scott Montagu, M.P., on dustless roads. 'Tarmac' was mentioned as being the most successful metalling for such roads. Where and by whom is 'Tarmac' prepared? Does it make a good permanent road as well as being dustless? Can you give me particulars of the kiln for heating the slag, and to what temperature it is necessary to heat it? Could you also give me the address of the Welsh Macadam Co., Ltd., mentioned under 'New Companies' in your issue for January 4th?"

"Tarmac" is a proprietary article prepared by The Tar Macadam (Purnell Hooley's Patent) Syndicate, Ltd. The patentee is the county surveyor of Nottinghamshire, an acknowledged authority on the subject of macadam roads. We are unable to give particulars of the kiln employed, this being a patent of Mr. Hooley's. The success of "Tarmac" is due to the care and knowledge exercised in its manufacture; the quality, quantity and mixing of the ingredients being essential points. Tar macadam can be prepared by anyone; but in many cases roads made with this material have failed



BRACKETS FOR CAST-IRON COLUMNS.

owing to there being an excess of tar or to the stone employed not being sufficiently absorbent to retain the tar or not being sufficiently heated. When properly compounded it makes excellent roads, with a saving in maintenance, scavenging and watering. It is excellent for motor and cycle traffic. The absence of dust is not its only recommendation, as tar is an excellent binding, and by preventing the rapid attrition of the stone and its consequent "breaking down" makes the road more durable. The material is also more impervious, and consequently more sanitary, than ordinary macadam. The usual stoves for heating the stone are simple floors of either iron or brick with flues under. Iron floor stoves can be obtained from one or two ironfounders; the brick floor may be constructed like the floor of a brick kiln. The tar is heated in an ordinary tar boiler. We add particulars of the method of making tar macadam roads at Harrogate, which town is noted for this kind of road. Foundation:—9in. stone pitching with 4ins. of ballast, cost 1s. 8d. sq. yd.; tar macadam of limestone; bottom coat, gauge 2¼ ins.; middle layer, gauge ¾in.; top or surface layer, gauge ⅜in. mixed with 12 per cent. of coke-breeze. The tar is used plain and cold. The stone is heated on an iron floor stove made by a Batley firm; when hot (so that the hand can barely rest on it) the tar is poured over it, and the whole is turned over so that the stone is completely covered. The average quantity of tar is 6 or 7 gallons per cub. yd., but the amount varies according to the size and porosity of the stone and the quality of the tar. (Poor tar is sometimes heated, a little creosote and pitch being added to enrich it.) After manufacture the material is stored three months to mature. The bottom layer is 2¼ins. thick after rolling, the middle layer ½in. thick after rolling, and the top or surface coat ¼in. after rolling. Each coat is rolled with a 10-ton roller, the rollers being wetted to prevent the material adhering. Traffic admitted after one week. Cost of tar macadam, 2s. to 2s. 3d. sq. yd. Total cost of road, 3s. 8d. to 3s. 11d. sq. yd. Particulars of tar macadam roads and footpaths in many towns will appear in the first (annual) issue of "The Municipal Engineer's Specification," to be published shortly from these offices, price 2s. 6d. We regret we do not know the address of the Welsh Macadam Co., Ltd., but you could obtain it from Messrs. Jordan & Sons, Ltd., 120, Chancery Lane, W.C., by whom the company was registered.

Roof-Trusses.

HESSLE.—FERRUM writes: "It is required as one of the testimonies of study for the R.I.B.A. final examination to draw 'diagrams of roof-truss of iron or steel not less than 40ft. span, with details to a large scale, with all the calculations for strength at the various parts fully worked out and appended thereto.' Can you refer me to the best and simplest authority for working out the strength of joints? I presume the section of the main members may be determined by graphic statics."

"Practical Designing of Structural Ironwork," by Prof. Henry Adams (price 8s. 6d. post free from our offices).

House Design.

BATH.—A. H. H. writes: "With the help of a builder I am preparing the designs of an house to cost about £700. Where could I obtain a few designs of modern houses of moderate size (detached) that would be of service to me in fixing the design of my own?"

We have published a number of illustrations of houses of this class in the last few years. If you desire to obtain complete working drawings you will not find what you want published in England—in the United States a good many books of designs are published. We cannot commend this. A design should be made to fit the local conditions and desires of the owner, and we advise you to apply to a competent architect.

Porosity of Marble.

DEVON.—ENQUIRER writes: "If I put a thin piece of marble in a cup filled with water, so that the water was touching the lower side, would the water cause the marble to be constantly damp on its upper surface, or could you inform me what material there is that would absorb water in this way?"

The marble would be damp, as it is somewhat porous; but there are other more porous materials which might serve your purpose better, such as pumice-stone, coke-breeze concrete and brick.

Hospital Planning.

GLASGOW.—A. W. writes: "Kindly name any recent and good work dealing with the planning (and more especially the engineering work) of hospitals."

We do not know of any very recent book. Probably the best for your purpose would be Sir Henry Burdett's "Cottage Hospitals" (10s. 6d. post free from our offices).

White Rough-cast.

WORKINGTON.—H. H. writes: "(1) How can I get a distinctly white colour on rough-cast? I do not mean the bluey-grey tint of lime rough-cast. (2) I note that in 'Specification' there is specified:—Portland cement, sand, pea-grit, &c., and 1 part of ground chalk. Will this produce the result I desire?"

(1) See a reply to an enquiry on this subject on p. 440 of our issue for January 9th, 1901. (2) Yes; the suggested method, if the sand is white and the cement not too grey, will give a good white colour.

Drawings and Models.

EDINBURGH.—GLENEVAN writes: "I contemplate building a small country house, and before engaging the services of an architect I am making a plan of the house myself in a rough way, and would like to hear of someone who could give me a finished plan, also a sketch. I should also like to know of someone who could make a small model of the house."

We advise you to consult an architect, otherwise you will probably neither secure efficiency nor economy. Very good models are made from plans and elevations by the London Drawing and Tracing Office, 98, Gray's Inn Road, London, W.C.

Payment for Additional Brickwork.

BERMONDSEY.—T. writes: "On p. 20 of your issue for January 11th you answered a question in which the word 'similar' was in the contract. Surely 14in. work is not similar to 9in. You say that I was supposed to have known what I was doing. I was taking it as 9in. brickwork, that is, similar to the other two fronts which were of 9in. work, and the surveyor knew it."

You do not state if there were any plans. If there were, and you were supposed to have seen them before you sent in your estimate, and 14in. brickwork was shown thereon, extra payment is not due, because then the word "similar" could only be read to apply to the colour and kind of bricks and general execution, and not the thickness.

Valuations and Estate Management.

GLASGOW.—SUBSCRIBER writes: "Which are the best works on (a) valuing, with special reference to Scotland, and (b) property and estate factoring?"

(a) "Valuations and Compensations," by Prof. B. Fletcher (6s. 6d.); (b) "Building Estates," by F. Maitland (2s.), and "Outlines of Landed Estates Management," by R. S. Burn (2s. 6d.). These prices are post free from our offices.

Damage Done by Frost.

BERMONDSEY.—T. T. writes: "Referring to the enquiry on p. 12 of your issue for January 4th, my facts were not put rightly. They should be as follows:—The brickwork was built partly with new and partly with old bricks and mill-mortar. The joints were raked out and pointed with mortar and cement, and left sound and perfect. The scaffolding was taken down and the work was passed as satisfactory. The work was done in October, and in November the frost came and flaked off parts of the joints. In December I asked for payment. I was then told that the frost had pulled out some of the joints, and I was called upon to put up scaffolding and make good before payment. Am I to be paid for this extra work? Am I to leave the scaffold there till next June? Can they compel me to do the work twice and get paid once? Has there ever been a question of this description decided in a court of law?"

We are still of the opinion that the work of re-pointing was not executed properly, and that your clients can deduct from your account a sum sufficient to get the pointing made good, if you will not make it good yourself. We do not remember an exactly similar case being decided at law, but if your client can bring expert evidence to prove the work was improperly executed you will have no case. It is all nonsense to talk about leaving the scaffold up for months. Of course it would be absurd to expect such a thing; precautions should have been taken to guard against damage so as to avoid the necessity of re-erecting the scaffold. As to the precautions that should have been taken, the joints should have been carefully raked out and washed with a stiff brush so as to remove all dust from the old mortar in order to give a good hold for the mortar and the bricks allowed to dry before pointing cement should have been used, as this sets and gets rid of its water quickly and once set will not be damaged by frost, or else unslaked lime used and the mortar prepared in small quantities immediately before being used, as should always be done in frosty weather, the unslaked lime developing warmth. It is only a question of utilizing th mortar quickly enough to enable it to bind with the bricks before it cools. If th weather is frosty the precaution should als be taken to put sacking against the wa where wet.

Book on Stair Construction.

ABERDOVEY.—A. S. writes: "Please nam a good book on stair construction showin accurately the way to proceed in markin and setting-out a circular and continual ra stair, &c."

Mowat's "Stairbuilding and Handrailing (price 12s. 6d. post free from our offices).

Glazed Brickwork.

LEEDS.—R. F. F. writes: "Is glaze brickwork dealt with in any number 'Specification'?"

Glazed brickwork is dealt with in "Spec fication" in the "Bricklayer" section, whi glazes are dealt with in the "Terra-cot and Faïence Worker" section. The la number is out of print; but a copy "Number 6" can be had, price 5s. 9d. po free, if you require information immediatel "Number 8" will be ready shortly, an to be sure of getting it you should order copy at once.

Keystones.

A new Court House is to be built at eltham.

For improving the Streets of Athens everal schemes are now under consideration y the municipality.

The Carpenters' Company will entertain ie president and vice-presidents of the ociety of Antiquaries at dinner at Car- enters' Hall on Wednesday, February 22nd.

Incorporated Clerks of Works Association Great Britain.—The twenty-second annual inner will be held at the Criterion Restau- nt on Saturday, February 11th, at 6.15 p.m.

For converting the Old School Buildings Norwood into a home for aged married ouples and aged women, the design of r. E. C. Beaumont, of London, has been lected in competition. The estimated ost is £3,950.

"To Associate Technical Instructors."— he annual general meeting of the Associa- on of the Teachers in Technical Institutes onstituted in October last) was held at the irkbeck College, London, on January 21st, hen the constitution and rules were oproved and officers elected.

The Town Walls of Newcastle.—At last Vednesday's annual meeting of the New- stle Society of Antiquaries a long discussion ok place on the proposed demolition of e Plummer Tower and the preservation of e town walls. The council of the Society as instructed to take immediate steps for eservation and custody.

At the Leys School a swimming-bath, a iapel and a new gymnasium are to be pro- ded. The swimming-bath is now being iilt at a cost of £6,000 to the designs of r. Robert Curwen, architect of the school. iriously enough, there is at present no vimming-bath in the university town of ambridge. The Leys swimming-bath will 90ft. by 35ft.

Royal Naval College, Dartmouth.—This iportant building, designed by Sir Aston ebb, R.A., F.R.I.B.A., has now been com- eted. It provides accommodation for 396 dets, who will be drafted from Osborne ollege to pass the second two years of the ur which cover their early training as ficers. A full description of the building as given on p. 80 of our issue for September 1, 1903.

Preston School Competition.—The con- tions of this competition provide that the chitect's fee shall include payment for bills quantities and other surveyor's work, tlement of accounts, and several extra pies of plans. In reply to a letter from the stitute calling the attention of the Preston ucation Committee to the inadequacy of remuneration offered, the director writes it he cannot hold out any hope that his mmittee "will modify the remuneration ered to architects, or its terms." Architects therefore requested not to compete.

The New Victoria Station Front.—Writing the "Times" in regard to the protest of the chitectural Vigilance Society against the posed new front to Victoria Station (see 34 of our issue for January 18th), Mr. islie J. Horniman states that under the ndon, Brighton and South Coast Railway t of 1899 the elevation of any building itting on Buckingham Palace Road had to approved by the Grosvenor Estate, the City uncil of Westminster and the London unty Council. "It was wholly due to the ion of the last-named body, at the insti- tion of its architect, that we now have a ll which your correspondents truly say, iough simple, is in good architectural te.'" Mr. W. E. Riley (superintending hitect to the London County Council) pared the sketch design.

For Cleaning the "Underground" Tunnels and brightening-up the stations £10,000 is to be spent.

Elgin Parish Church Competition.—The design of Mr. P. Macgregor Chalmers, of Glasgow, has been selected by the congregation.

Carnegie Library, Wardle, Rochdale.—The limited competition for this building has been decided in favour of Messrs. Butterworth & Duncan, of Rochdale.

Change of Address.—Messrs. Treadwell & Martin, architects and surveyors, have moved their offices from 2, Waterloo Place, Pall Mall, to Charing Cross House, 29A, Charing Cross Road, W.C. Their telephone number, however (5337 Gerrard), remains unchanged.

A Figure of an Angel has been approved by the Kaiser for erection in the Hall of Fame in the graveyard at Gravelotte. The figure is of gilded bronze 10ft. high, and stands on a pedestal of polished black granite. Its eyes are of precious stones, and the hem of its garment is studded with green agates.

Seventh International Congress of Architects, 1906.—The council of the Institute has voted a sum of £500 for the purposes of this congress, which is to be held in London from July 16th to 21st next year. The patronage of the King, the Prince of Wales, the Duke of Connaught and other distinguished persons has been secured.

A new Public Health Laboratory at Manchester has been erected in York Place, Oxford Road, at a cost of £13,000. It has grown out of the bacteriological department of the Owens College (now the University of Manchester) and was planned by Professor Delépine. Messrs. William Southern & Sons, of Manchester, were the builders.

A new Church at Kirkby Woodhouse is being erected from designs by Mr. Louis Ambler, F.R.I.B.A., of London. The foundation stone was laid by the Duke of Portland last week. The first portion of the work, comprising nave (77ft. by 24ft.) and chancel (33ft. by 20ft.), will cost about £6,000. Accommodation will be provided for about 400 worshippers. A tower and spire will be built later. Mr. William Smith, of Newark, is the builder and Mr. D. Davies the clerk of works.

Leeds and Yorkshire Architectural Society.—At last Thursday's meeting Mr. Thomas H. Mawson, hon. A.R.I.B.A., read a paper on "The Principles and Practice of Garden Making." After having enunciated guiding principles he emphasized the importance of the proper laying-out of trees and plantations. The three great considerations in deciding upon the site and position of a house were—climatic conditions, nature of subsoil, and the aspect (for no matter what the prospect offered it was unwise to build on the north, north-west or north-east side of a hill or knoll). Beds of clay, though perhaps not so unhealthy, were cold and disagreeable, and difficult to drain by the natural process of filtration. For healthy beauty, luxuriance and ultimate cheapness Mr. Mawson advised a site having an under-stratum of gravel or marl and a good surface covering of loam. With regard to surface-soil for a flower bed, it was a good plan to lay at a depth of about 2ft. a layer of broken bricks, then to overlay this with a covering of ashes, and then about 21ins. of soil of desirable lightness: for trees and shrubs a depth of 1ft. 6ins. or 2ft., with a plentiful admixture of fibrous turf loam, was satisfactory. Grass also required a depth of soil not less than 8ins., with a well-drained bottom properly prepared. Mr. Mawson showed three garden schemes designed by him, one in Ashdown Forest, another on Berkhamsted Common and the third in Devonshire.

Glasgow Technical College Architectural Craftsmen's Society.—At last Friday's meeting of this society Mr. Smith, inspector of works at the new college buildings, read a paper on mechanical ventilation, in which he claimed that the plenum system was the best adapted for the ventilation of large buildings in towns, by reason of the ease with which it could be controlled. In the discussion which followed the advantages of "automatic ventilation" and of the "equilibrium" system of mechanical ventilation were upheld by several members.

New Mission Premises in St. Peter's Parish, Islington, were opened on Wednesday last by the Bishop of Islington. On the ground floor is a hall to seat about 150 people. The first floor is divided into class-rooms and club-room, and the second floor provides accommodation for caretaker and parish workers. The building is warmed by means of hot-water radiators from a boiler in the basement. The total cost has been £2,800. The architects were Messrs. James & Laycock, of 4, Bloomsbury Place, W.C., and the builders Messrs. Patman & Fotheringham.

An Alarming Incident occurred recently at Trinity Street Station, Bolton. Whilst business was proceeding as usual a crack like that of a rifle startled everybody in the booking-hall. The noise was immediately succeeded by a shower of ice, and then it was perceived that the cause was the bursting of one of the three iron pillars which support the roof. It was undoubtedly due to the freezing of a quantity of water which had got into the hollow centre of the column when the booking-hall was being erected. It is presumed that the column was half or three-quarters full. It is worth noting that the column was situated in a very draughty position, the cold air coming up the staircase from the up platform and passing through the booking-hall into Trinity Street.

Views and Reviews.

A Welsh Cathedral.

Sir Gilbert Scott is anathema to the anti-restorationists, but we must even give the Devil his due and this cathedral of St. Asaph is an instance of Scott's good-doing, for it was under his direction the layers of whitewash that covered the interior were removed, as well as the stucco of Wyatt, who also constructed a false roof to the nave which entirely concealed the clearstory from within. The whole history of the cathedral is very readably brought together here, supplemented, as in the other books of this series, with numerous photographs and reproductions of old engravings: the former, by the way, are excellent, but the author might have found a more proficient friend to photograph the engravings, which are sadly out of focus and blurred in places.

"The Cathedral Church of St. Asaph," by Pearce B. Ironside Bax. London: George Bell & Sons, price 1s. 6d.

Laxton's Price-Book.

This is the eighty-eighth edition of "Laxton's." As heretofore, it has been revised and brought up to date. There are no radical alterations—nor could there be in such a book—but builders and architects will of course need to have this latest edition. As pointed out quite recently in our columns, it is essential for go-ahead business men to use reference books absolutely current: books a year or two old will not do. Hence readers should throw away their old editions of "Laxton's" and get this one.

"Laxton's Price-book for Architects, Builders, Engineers and Contractors, 1905." London: Kelly's Directories, Ltd., 182-184, High Holborn, W.C., price 4s.

Contracts Open.

NEW GRAMMAR SCHOOL AT FARNHAM, SURREY.
TO BUILDERS.

The Governors of the Farnham Grammar School are prepared to receive TENDERS for the erection of a new Grammar School at Farnham. Drawings, Specification, and a copy of the Conditions of Contract may be seen on application to the Architects, Messrs. Jarvis and Richards, 36, Victoria Street, Westminster, S.W., and Bills of Quantities and Form of Tender may be obtained from them on and after the 23rd JANUARY, 1905, on payment of Two Guineas; the sum so expended will be returned to those persons who send in Tenders in conformity with the conditions specified below.

The Governors do not bind themselves to accept the lowest or any Tender.

TENDERS must be delivered before 12 o'clock noon on the 7th FEBRUARY 1905, addressed to the Clerk to the Governors of the Farnham Grammar School, E. Kempson, Esq., 121, West Street, Farnham, and endorsed "Tender for New Grammar School, Farnham."

E. KEMPSON,
Clerk to the Governors.

BECKENHAM URBAN DISTRICT COUNCIL.
TO CONTRACTORS.

The Beckenham Urban District Council invite TENDERS for the SURFACE DRAINAGE of Kingswood and Mays Hill Roads, Shortlands.

The works consist of the laying of about 4,000 lineal ft. of 9 in. pipes, 250 lineal ft. 12 in. pipes, together with the construction of about 20 manholes and the fixing of 70 stoneware gullies.

Plans and sections may be seen and bills of quantities, specifications, and forms of Tenders obtained on application to Mr. JOHN A. ANGELL, Surveyor, on and after JANUARY 20th, on deposit of £1 (cheques not accepted), which will be returned on receipt of a bonâ-fide Tender.

A clause will be inserted in the Contract providing that the contractor shall pay to the workmen employed in the execution of the work the wages generally accepted as current for workmen engaged on similar work in the district.

Payment under the Contract will not be made until six months after the completion of the works.

Tenders, duly sealed and endorsed "Tender for Drainage Works," to reach undersigned not later than FOUR p.m., MONDAY, FEBRUARY 6th, 1905.

The Council do not bind themselves to accept the lowest or any Tender.

By order,
F. STEVENS,
18th January, 1905. Clerk to the Council.

NOTICE TO OUR SUBSCRIBERS.

THE INDEX OF "THE BUILDERS' JOURNAL."

The Title Pages and Index to any volume of "THE BUILDERS' JOURNAL" may be had free, upon application being made to the Office, Great New Street, enclosing 1d. stamp to cover postage of same.

VOLUMES I. to XIX. of
THE BUILDERS' JOURNAL.

Handsomely bound in cloth gilt, 7/- each.

Binding Cases for any of the above Volumes can now be obtained, price **1/9** each.

Privileges open to all Regular Readers of the "Builders' Journal."

I.—Free Monthly Advertisements.

1. A Free Advertisement of 12 words in the Wanted or Miscellaneous Advertisement Columns, in one issue of the BUILDERS' JOURNAL during each calendar month will be given to any regular reader.

2. The charge of one penny will be made for each additional word.

3. Advertiser's Name and Address or Box Number must be counted, but will in no case be reckoned as more than five words.

4. All advertisements must be accompanied by the correct remittance, and should a receipt be required a stamped addressed envelope must be enclosed.

5. The Proprietors reserve to themselves the right of refusing any advertisement.

II.—Free Answers to Enquiries.

1. The services of a large staff of experts are at the disposal of all regular readers who require information on architectural, constructional or legal matters.

2. Questions should in all cases be addressed to the Editor, and be written on one side of the paper only.

3. Correspondents are particularly requested to be as brief as possible.

4. The querist's name and address must always be given, not necessarily for publication.

Note.—Owing to the large number of enquiries we receive weekly, we are compelled to restrict the advantages of this department to Regular Readers.

III.—Free Accident Insurance of £500.

1. Every regular reader of the BUILDERS' JOURNAL is entitled to the benefit of this Insurance.

2. A Pamphlet giving full details of this and other Insurance schemes inaugurated by the BUILDERS' JOURNAL for the benefit of its readers, and guaranteed by "The Ocean Accident Corporation, Limited," will be sent on application.

What is a Regular Reader?

We have employed the term "Regular Reader" throughout these announcements as the description "subscriber" is often understood to mean one who subscribes direct to the publishing office.

We mean by a Regular Reader anyone who has placed an order with us or any newsagent or bookstall for the BUILDERS' JOURNAL for one year.

Those readers who order the BUILDERS' JOURNAL through their local newsagent or bookstall should send us the newsagent's receipt. Their names will then be placed on our subscribers' list, and they will be entitled to all the advantages set out above.

5 O'CLOCK P.M. MONDAY IS THE LATEST TIME FOR RECEIVING "WANT" ADVERTISEMENTS.

THE BUILDERS' JOURNAL SUPPLY DEPARTMENT.

Following our settled policy of helping our subscribers in every way possible, we have decided to inaugurate a department for the supply of drawing office requisites of a reliable nature, and at low prices.

We have been able to make satisfactory arrangements with the best manufacturers, and we propose to publish from time to time illustrated lists of the articles supplied with prices, &c., as follows:—

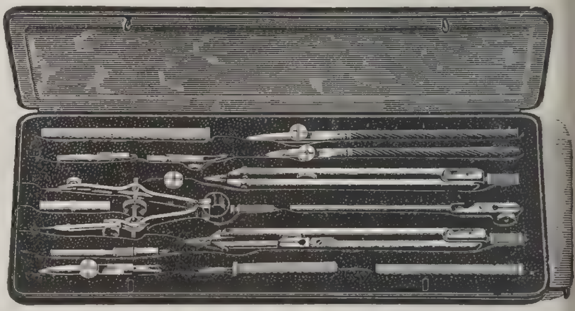
No. 1 List. Sets of Mathematical Instruments.
No. 2 List. Various Scales and Philotechnic Set.
No. 3 List. Drawing Boards, T Squares and Set Squares.
No. 4 List. Drawing and Tracing Paper, Tracing Cloth, &c.
No. 5 List. Inks, Water Colours, Paints, Brushes, &c.

LIST No. 1—PART II.

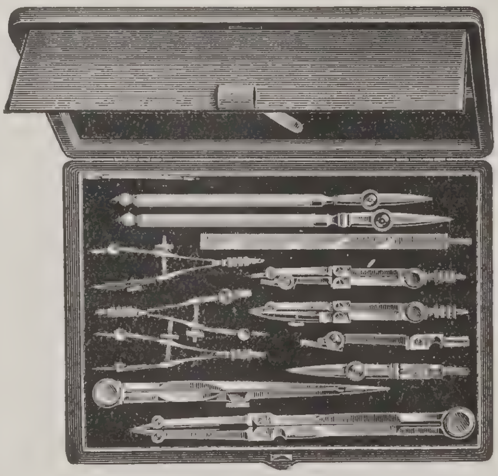
MATHEMATICAL INSTRUMENTS.

No. R 6.

Solid Leather rod-fastening Pocket Case, containing German silver instruments, 6-in. compass with knee joint, pen and pencil legs, lengthening bar, improved hair-spring divider, bow compass, two metal pen or pencil leg holders, 2 hand-ruling pens, and combination case of leads and compass key. **Price 45/-**

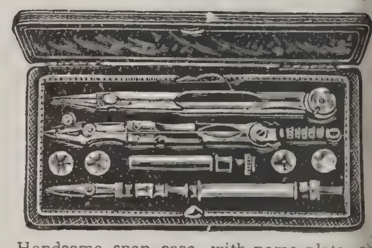


No. 46.



Morocco pocket case, silk lined, electrum name plate in centre of lid, and lift-up flap, containing the following superior German silver instruments:—Compass with double knee-joints and needle-points, pen and pencil points, lengthening bar, hair-spring divider, three needle-pointed spring bows, ink and pencil needle-pointed double knee-jointed bows, jointed ivory pen, steel ditto, with ivory parallel and protractor. **Price £3 3s.**

Nos. 69-40.



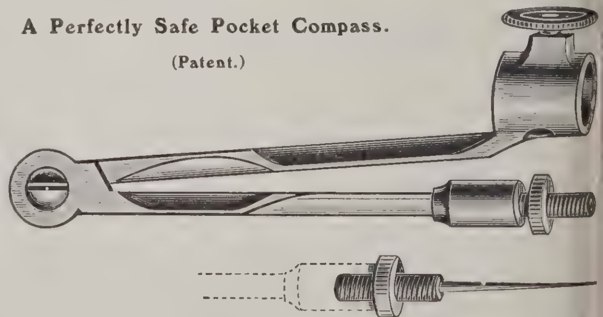
Handsome snap case, with name plate, co
taining bayonet adjustment double knee-jointe
compass (electrum) with bow-head and poin
to hold needles or leads, combination pe
point and handruling pen adjustable to con
pass, with or without bar-handle, fine divid
with deep hollow, case for leads and needle
drawing pins and compass key. **Price 11/**

A Perfectly Safe Pocket Compass.

(Patent.)

This Compass has a Reversible Point fitted with double screw ends. It takes any pencil, is easily adjusted, and always ready for use.

Price 9d. each.



The above Prices include Postage within the United Kingdom.

All Correspondence and Orders should be addressed to

THE

BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD.

February 8, 1905. Vol. 21, No. 522.

6, Great New Street, Fetter Lane, E.C.

Summary.

Sir Aston Webb has been selected by the Royal Institute of British Architects as a fit recipient of the Royal Gold Medal, 1905. (Page 72.)

In his address to students Mr. John Belcher, A.R.A., urged the importance of laying a good foundation in a practical knowledge of the art of construction and the right use of materials. (Page 72.)

At the cathedral of St. John, New York, some huge granite columns have been erected. They are in two parts, the lower part weighing 90 tons and the upper part 40 tons, and very great difficulties have been experienced in turning them in the lathe, transporting them through the streets, and erecting them in position. The original intention was to have each column in one piece, but it was found impossible to polish them in the lathe, every attempt to do so resulting in fracture. The columns were carried through the streets on a very stoutly built wagon—hauled from point to point by an engine. Altogether they have cost £31,000. (Page 70.)

In a paper on ventilation Mr. J. D. Sutcliffe says that he has never been able to substantiate the claims made by manufacturers that their particular cowls will produce strong extraction currents of air in all weathers. Heat is necessary if such effective extraction is wanted. A good-sized Bunsen burner fixed just above the ceiling line in an outlet turret is a help, but a better arrangement is a special heating battery. (Page 76.)

£130,000 is still needed for Liverpool Cathedral. (Page 80.)

Mr. Frederic Harrison writes condemning the proposed frontage line of the improvement scheme between the two churches in the Strand. (Page 81.)

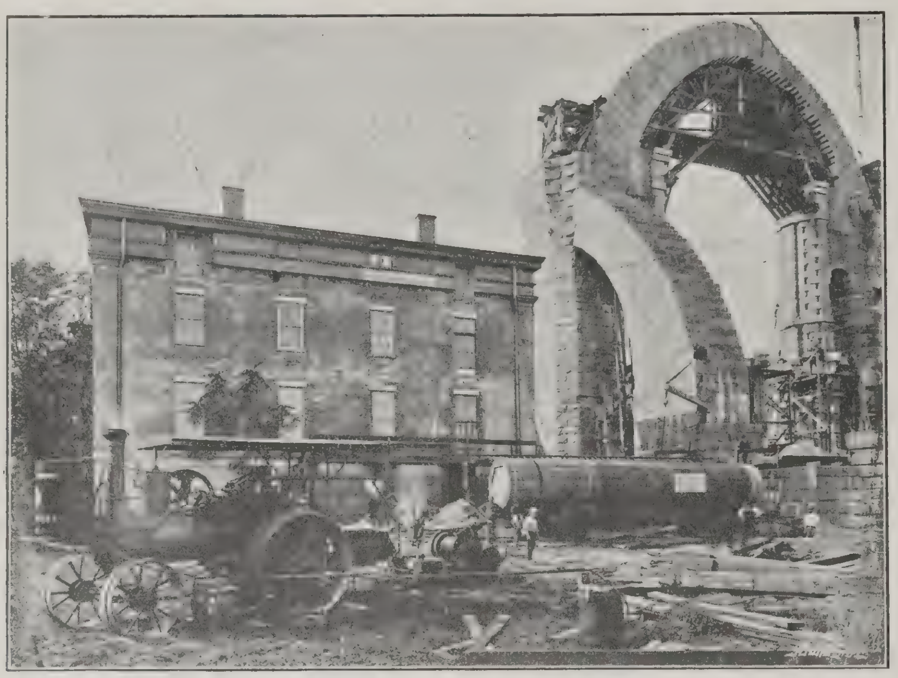
The large new hotel which is to be erected in Piccadilly according to the design of Messrs. William Woodward & Walter Emden, joint architects, will provide thirty shops on the ground floor, together with a large restaurant, lounge, &c. The elevation to the Quadrant is not yet settled. (Page 72.)

Mr. Cyril F. Fryer (Palgrave & Co.) calls attention to the fact that an architect (as distinguished from an estate agent) cannot recover a fee or commission from a vendor when he (the architect) introduces a purchaser of a property which is to be developed under his direction. (Page 75.)

The late Mr. J. T. Wimperis, F.R.I.B.A., died worth £51,430. (Page 80.)

To Our Readers. As our readers will notice by this issue, we have decided for the future to publish only one plate every week, except when something of very special interest or importance arises. This decision has been dictated by several considerations. First we may mention that the quality of the paper on which THE BUILDERS' JOURNAL is printed has been so much improved within the last few years that the illustrations in the text are now quite as good as in the plates, the only advantage of the latter being that they allow large illustrations to be given extending over two pages. As a rule, however, one plate per week is sufficient for the adequate reproduction of drawings or photographs. Secondly, there is the important consideration of what is most appreciated by our readers. It must not be forgotten that latterly a great change has taken place in respect to the practice and study of architecture and buildings, more particularly in regard to the attitude taken up towards antiquarian and historical knowledge as contrasted with the scientific knowledge of construction and practice to-day. Thus there is a far greater appreciation of instructive articles on new buildings and methods than of mere collections of architectural perspectives forming "picture-books." We hold the view that the purpose of a technical journal is not to amuse but to aid its readers by the record of facts, news and advances made in artistic and scientific practice, and the support we have received confirms us in this belief. Our articles on buildings in course of construction illustrated with photographs have met with a flattering reception, while our enquiry column is one of our most popular features. We find that our readers would prefer expenditure to be devoted to the extension of this policy rather than on an extra plate. In this connection we may call attention to our new Fire Supplement, another number of which will be given with our next issue.

Paris in London. PEOPLE in the provinces are naturally not much interested in many London affairs to which considerable space is devoted by the Press, and, bearing in mind that we address ourselves to readers in all parts of the Kingdom, we endeavour to avoid giving undue attention to matters of merely metropolitan interest; but, after all, the biggest things are done in the capital, and in a sense the reputation of the nation mostly depends on its chief city; so that we make no excuse for again referring to the Strand improvement scheme, more especially as the fate of it, after so many hopes and fears, now seems to be settled. A proposal of great interest has been made to the Council on the strong recommendation of its Improvements Committee. It is no other than the letting of the central part of the Strand island site to a French syndicate at the huge ground rent of £55,000 a year for 99 years. The proposal has been made by Mr. W. Gilbee Scott, F.R.I.B.A., and Mons. Ernest Gérard, acting on behalf of the syndicate. It is proposed to erect merely on the middle portion of the site "a fine stone building of commanding architectural features." This central building will be of an average height of about 60ft. and it will consist of a basement with ground and first floors only, containing large galleries for use in connection with art and industrial exhibitions. A French theatre and a French restaurant and café of the highest class will also be included in the central block of buildings. Beyond the central block of buildings the site will be enclosed by shops, with basements and ground and first floors only, the height above the ground-level being about 27ft. The space between the central block and the shops will be laid out as gardens and ornamented with fountains, statues and flower beds. A charge will be made for admission to the grounds. The roofs of the shops will be used as a promenade, to which access will be obtained from the gardens. It is also proposed to erect an open-air theatre for summer use. The promoters anticipate that the buildings surrounding the site will be let to French jewellers, bootmakers, milliners, confectioners, stationers, &c., or will be used as clubs, offices, or for other commercial purposes. The elevations of the buildings and the lay-out of the grounds will be subject to the approval of the Council. So much for the facts. And what if such a scheme were carried out? As yet no designs have been put forward, and it is therefore impossible to form a judgment of the architectural effect. But, meanwhile, we have the names of Mr. Gilbee Scott and M. Gérard to conjure with; the former very little known to the architectural public and the latter an absolute stranger. The Improvements Committee positively trembles at the great ground-rent now actually within reach: and hastens to inform the Council that the acceptance of the proposal in no wise affects the memorial in regard to the height of buildings. The Committee is eager that the chance shall not slip by. Peace to them!



VIEW SHOWING TRACTION ENGINE, HOIST AND COLUMN ON TIMBER WAGON.

130-TON GRANITE COLUMNS.

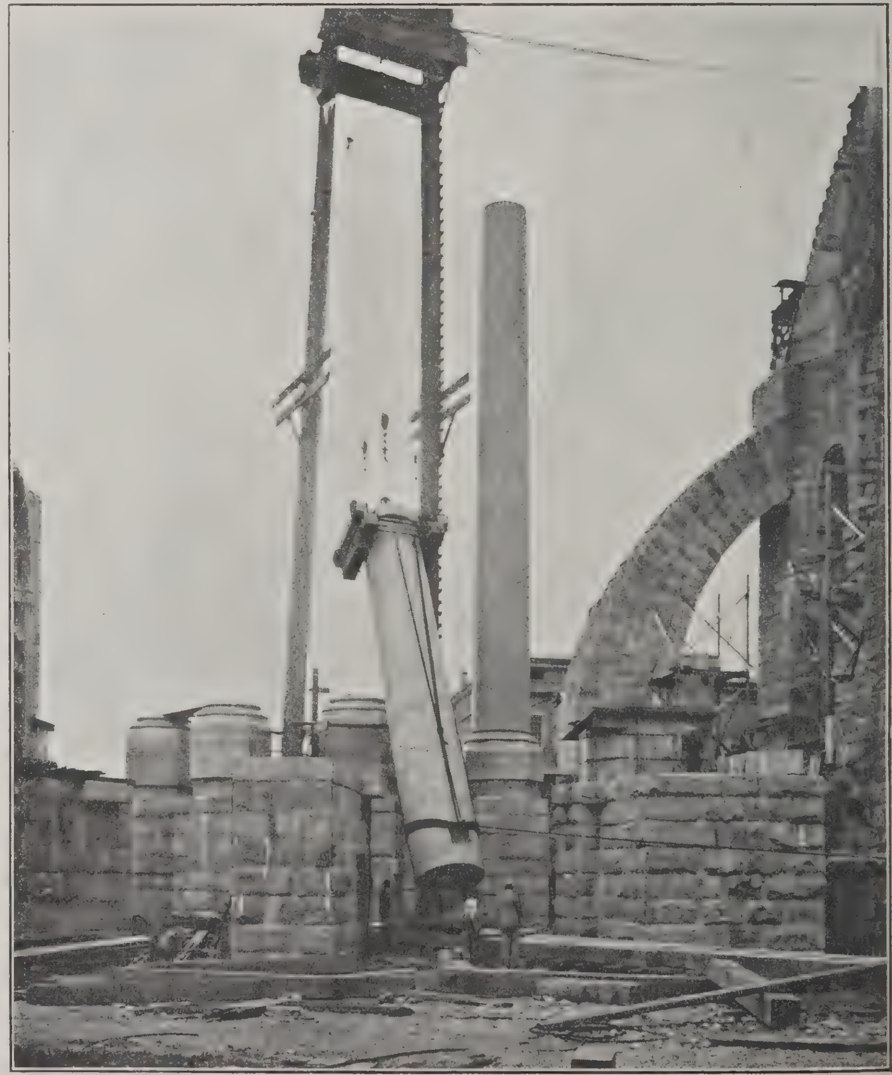
We give this week a series of photographs showing the erection of the huge granite columns at the Protestant episcopal cathedral of St. John the Divine, New York, the architects for which are Messrs. Heins & La Farge. These columns, of which there are eight, form a semicircle around the altar. Each is 6ft. in diameter and 54ft. in height, in two pieces, the lower one being 36ft. long and weighing 90 tons, and the upper one, seated without dowelling on its flat top, being 18ft. high and weighing 40 tons: so that each entire column weighs 130 tons.

At first it was intended to make them monolithic, and no special difficulty was experienced in quarrying full-length slabs from a stratum of about the required thickness. These were hand-dressed approximately cylindrical, and the first one was successfully turned in a specially constructed lathe (said to have cost £9,000), but broke while being polished. The break was attributed to torsion, and for the second column power was applied at both ends of the lathe. But notwithstanding this arrangement, the column broke during the roughing. It was then suggested that the trouble lay with the excessive bending stresses due to the very long unsupported length. A centre support therefore was provided for the third column, but this column broke more quickly than either of its predecessors, and the attempt to make them monolithic was then abandoned.

The shorter pieces were turned and polished without difficulty, and were afterwards enclosed in cylindrical cases made with 3in. by 4in. steel-hooped wooden staves set close together and secured to circular end-pieces. They were loaded on barges, two complete columns to each, and towed to New York from the quarries at Vinalhaven, Me. Skids were arranged from the deck to the shore, and several turns of wire cable were taken around the middle of the column. One end was made fast to a hoisting engine, and the free end was kept tight as the rope was overhauled, rolling the column easily to shore. Each piece was loaded on a special wagon and transported over a mile through the city streets and up a considerable grade to the site.

The wagon (here illustrated) was built in Maine expressly for use on this work, and is of simple and massive construction. It consists of two pairs of wheels, two longitudinal beams and two cradles on the axles, and is built entirely of wood, except the axles, tires and a few bolts and small braces. The 10in. by 12in. longitudinal timbers are 30ft. long, $3\frac{1}{2}$ft. apart on centres, and overhang the front and rear axles about 2ft. and 5ft. respectively. The 8in. by 8in. rear axle and the 7in. by 7in. front axle each have six **U**-bolts fastening a solid 10in. by 14in. wooden bolster to the upper side. On the front axle the bolster supports a horizontal wooden turntable platform or fifth wheel, on which the longitudinal timbers are seated. At the rear end they are seated directly on the bolster. Solid fillers are put on the axles between and above the longitudinals and are concaved on the upper surface to a radius of 3ft. to receive the columns, which are thus supported about 4ft. clear of the pavement. The rear wheels are about 4ft. and the front wheels about 3ft. in diameter, all of them being 20ins. thick and made with seven thicknesses of planed white oak plank. Each thickness is made of sixteen sectors in the large wheel and twelve sectors in the small wheel, bolted together and breaking joints in adjacent thicknesses. A steel disc is bolted to the centre of the wheel on each side, and through it and the solid planks a hole was bored to fit the axle, so that the bearing of the latter is on the ends of the fibres. The tires consist of four 5in. by 1in. welded rings sunk on each wheel. The rear wheels are provided with a break-shoe operated by a screw, but it has been seldom necessary to use this, most purposes being served by a transverse timber chained to the axle and dragging on the ground close to the wheels, but clear of them so long as the wagon advances. If the wagon tends to move backwards, the timber immediately serves to chock the wheels.

The operation of hauling the wagon along the streets was interesting. Instead of inserting timbers in the ground to secure purchases, two iron hooks were used, a paving block being taken up, the hooks fixed in the



HOISTING LOWER PORTION OF COLUMN (90 TONS) ON TO BASE.

SETTING COLUMN ON BASE.

·ound and kept in place by placing a action engine over them, and the haulage ·en slowly effected by winding on the engine. his system worked satisfactorily and the agon did not cause any injury to the pave- ent. The first column section was drawn om the dock pier to the site in nineteen ays, while some of the others were drawn seven days each. The eight columns were ansported in about six months with a body four men and a superintendent.

At the site the column sections were volved into vertical positions and hoisted three tackles forming a 30-part system spended from a shear legs or breast derrick ade with two Oregon pine timbers 98ft. ng, hewed 2ft. square for the lower 30ft. and pered thence to a diameter of 20ins. at the p, where they are capped with an oak mber. From this timber were suspended pair of 10-part tackles and a single 6-part ckle in the centre, all of them reeved with n. steel rope. The centre tackle was an dependent one operated by a separate oisting engine. The two side tackles were eved with a single line common to both as to equalize the stress between them and rry through single top and bottom sheaves as to make up the thirty parts and lead each d to a separate Lidgerwood hoisting engine. y this arrangement equilibrium was main- ined between all parts of the tackles, and e stresses were equalized, no matter whether e engines were working uniformly or simul- neously or not. It was considered that the centric stress in revolving the column from e horizontal to the vertical position would dangerous for lewis bolts, and a special evice was adopted for attaching the tackles the upper ends of the columns during this art of the operation.

The 90-ton bottom sections of the columns ad been turned and polished up to a distance 18ins. from the end, where a rough shoulder a diameter of about 10ins. greater than the aft was left to form a collar. On the other side of this collar a pair of concaved yoke pieces were bolted to and took bearing against it. Through each side was set a $2\frac{3}{4}$in. **U**-bolt, to which a sling was attached to receive the tackles. The lower end of the column was lifted and placed on rollers, tackles were attached to the upper end and operated to drag the column forward and lift it into a vertical position, when it was seated on the permanent base. The yokes were then removed and the enlarged upper end of the column was scabbed off by hand and the surface dressed perfectly horizontal to a line marked by a diamond on the polished surface of the shaft.

The 40-ton upper sections of the columns were handled differently. No collar was left on the end of the shaft, which was dressed to the exact dimensions. Two clamps made with pairs of solid oak yokes connected by two $1\frac{3}{4}$in. and two 2in. screw rods at each end were fitted to the top of the column about 16ins. apart and screwed up as tight as possible so as to develop a large amount of friction. A **U**-bolt of 2in. iron was attached to one side of the upper yoke, and a similar one was attached to the other side of the lower yoke, passing freely through a slot in the upper yoke. The hoisting sling was connected to these **U**-bolts and thus developed balanced eccentric stresses in both yokes, tending to cramp each one against the column and increase the friction, but maintaining equilibrium between themselves. This connection sufficed to revolve the column into a vertical position. It was temporarily seated on the lower end, the yokes removed, and a lewis bolt inserted in the top. The tackles were connected to the lewis bolt and lifted the column and seated it on the top of the lower section in its permanent position.

It required about one month to set up both sections of the column and prepare for the setting of the next column, but when everything was in readiness the actual hoisting of the column occupied only a very few minutes. The total cost of the eight columns has been about £31,000.

Mr. John Pierce, of New York City, was the general contractor for furnishing the columns. The work of transporting and erecting them has been carried out by Messrs. The Jones Brothers Co., of Boston.

The erection of the cathedral was begun thirteen years ago, and the work will not be completed for a long time to come. The following are the chief dimensions of the building:—Total external length, 520ft.; width across front, 190ft., across transepts, 290ft.; height of central spire, 425ft; height of four flanking towers, 160ft.; total exterior diameter of central tower, 116ft.; height of vaulting, 230ft.; height of western towers, 245ft.; total area of cathedral, 99,500 sq. ft.

WE this week give the Piccadilly elevation of the new hotel which is to be erected on the site bounded by Piccadilly, Regent Street, Air Street and Piccadilly Place, now occupied by the St. James's Hall and Restaurant and adjoining business premises. The property belongs to the Crown, and it is a stipulation that the Piccadilly frontage shall be set back 20ft. so as to widen the thoroughfare to 80ft. Upwards of half a million sterling has been expended in acquiring the site, and when the hotel and shops are erected and the hotel equipped, an actual cash expenditure of more than one million pounds will have been made. We hope soon to be able to give the elevation to the Quadrant; as however that elevation must necessarily form the basis of the designs for the whole future Quadrant very great consideration is being given to the subject by the Treasury, the Office of Woods, and the architects (Messrs. William Woodward and Walter Emden). The whole of the elevations are to be executed in Portland stone and under the hotel, on all frontages, will be shops. The roofs will be covered with green slates and the domes with golden and richly-coloured Spanish tiles. The planning of the building has involved very great consideration in regard to the requirements of a large modern hotel. There will be twelve shops fronting Piccadilly, eleven shops fronting Regent Street, three shops fronting Piccadilly Place and four shops fronting Air Street, and all will comprise ground floor with a mezzanine above and a mezzanine basement. The accommodation in the hotel will be:—On the ground floor: entrance halls from Regent Street and Piccadilly, a large restaurant, lounge, kitchen, cloak-rooms and lavatories. In the basement: a grill-room, dining-room, lounge and smoking-room, billiard-room and usual offices. In the sub-basement: Turkish baths and rooms used in connection therewith, lavatories, cellars, &c. On the seven upper floors 314 rooms, seventy-four bathrooms, w.c.'s, services, passenger lifts, goods lift; lounges on the second and third floors and a masonic temple on the latter floor; on the first floor, three dining-rooms, a drawing-room, reading- and writing-room, lounge and servery, &c. A contract for the erection of the building has been entered into with Mr. H. H. Bartlett, carrying on business as Messrs. Perry & Co., of Bow.

The Case for Architects' Registration. — One of the latest additions to the profession of architecture is a pensioner from the ranks of the Royal Engineers, who, after leaving the Army, set up in business as a fish salesman! This gentleman now advertises in the local papers as an architect and surveyor, and states that he is "prepared to execute plans and designs for all kinds of proposed new works, buildings, structural alterations, &c. Valuation of properties. Professional advice given on all architectural points! Moderate charges! Patronage earnestly solicited." Here's a case for the registrationists!

R.I.B.A.

President's Address to Students; Criticism of Designs.

A MEETING of the Royal Institute of British Architects was held on Monday evening, the chair being occupied by the president, Mr. John Belcher, A.R.A.

Mr. Graham, hon. secretary, announced the decease of two members: Mr. George Hurst Stanger and Mr. Walter Aston. He also stated that the late J. T. Wimperis left £1,000 at the entire discretion of the Council, and that Mr. Macvicar Anderson had given nineteen Architectural Union shares and Sir Aston Webb twenty-four shares for the purpose of promoting architectural education.

It was announced that the Council had selected Sir Aston Webb as a fit recipient of the Royal Gold Medal this year.

Mr. Belcher then delivered his address to students and Mr. A. N. Prentice, F.R.I.B.A., followed with a criticism of the drawings and designs submitted for the prizes and studentships this year.

Mr. Belcher said:—I should like to suggest certain methods to be adopted in the study of examples. The student's first impulse perhaps is simply to annex the whole subject as "stock" or "copy." Now certainly it is a very right and proper thing to sketch the building as a whole; but while doing so we must not let our thoughts lie idle; we should endeavour to discover why the subject is beautiful or admirable, what are the elements in it which have contributed to that result. At first, it may be, such an effort seems to go unrewarded; but if the habit be persisted in, intelligent perception will awaken, little by little the light will grow, and soon it will be quite easy to disentangle from the mass, as it were, those characteristics, those laws, those conditions, which have made the building what it is.

While traversing some particular line, for instance, note its relative proportions to the

HOISTING TOP PORTION OF COLUMN (40 TONS) INTO POSITION.

other parts. Follow out, if you can, the methods of construction, and mark how the effects are produced. Examine the general masses from various points of view and study the composition of your subject, not only in respect of its component parts, but also in relation to its environment. The latter is of great importance, for one of the chief elements of success in a building is its adaptation to its surroundings. Here it is especially that "scale" comes in, for the scale of a building must be either in keeping with or in contrast to adjoining buildings or objects, just as colours must either match exactly or be complementary to one another. Scale is relative and determines the proportion of one part to another and of the several parts to the whole. It is like the dominant note or key in a musical composition.

You are probably, all of you, aware that sounds which harmonize and please the ear have fixed relations to one another. Colour also has its divisions and harmonies, and you will not get far in architecture without discovering that here also similar laws hold good and that there is such a principle as a true proportion of parts in the scale of building. It is only by a diligent study of, and a careful regard for, these laws that we can effect a harmonious composition, which all the same can never be merely mechanical in architecture any more than it can in music. There is as wide a range of possible combinations and developments in the one case as the other.

You should also have regard to the aspect of the building you are studying—whether it is situated in the narrow street, the broad thoroughfare or in open ground. Note how the projections and lights and shadows are determined on each frontage. Where the sun penetrates reflected light may be taken advantage of. Projections and shadows on a south front are by no means the same as they would be with a north aspect.

It is only thus by analysing and searching out the guiding principles which have actuated men in the past that we shall really profit by a study of their work. If we can discover the sequence of thought which has guided them in the achievement of fine results, we in our turn may, by taking thought, successfully work out the problems which come before us. Depend upon it, that which we admire in their work is not the result of careless, accidental or haphazard arrangement of materials. No, there is thought behind it all, and the best results are just those upon which the best thought has been expended. If genius is not, as it has been defined, "an infinite capacity for taking pains," at any rate in architecture it is very nearly akin to an infinite capacity for taking thought.

Do not be misled by the apparent simplicity of much of the best work, for this very simplicity, if not the outcome of profound thought, is the triumph of a practised genius. "Through the complex to the simple" is almost a law of mental evolution.

Archæology has its place, but it should be kept there. It often usurps the interest and attention which ought to be given to the example as architecture. The glamour of historical romance has served to invest many a building with a purely fictitious value. The accidental effects of age and decay appealing to the sentiment of the man pervert the judgment of the artist, to his own detriment and that of his art. The same sentimental halo, hanging around all that is ancient, is responsible for the many imitations, forgeries and affectations which have so long dogged the footsteps and hindered the progress of genuine architecture, and which in some cases have proceeded to such an extreme of absurdity as to tempt men to forswear the past altogether and to rely upon their own creative faculty to invent something altogether new. This is the other extreme of folly—for folly it is to think that our inherited traditions can be safely ignored, or that buildings which have stood the test of time and criticism have nothing to teach us. They are, on the contrary, as mines of wealth in which, digging deep, we shall unearth many a hidden treasure. They put before us problems—and their successful solution. They portray many various methods and effective combinations, suitable forms adapted to different materials, varied textures serving a definite purpose, and other elements of beauty and strength which, if not always entirely realized, are yet present as an ideal which we may all study with advantage and strive to express in our own work.

So I say to you, my youthful fellow-students, Steer an even keel, if you can, between the Scylla of a superstitious and sentimental regard for the past and the Charybdis of a contemptuous indifference to all its works. If an example is merely old, leave it alone; if it is artistically good, approach it with all reverence, and examining its structure within and without endeavour to discover the secret of its charm, even as a bee extracts the honey from the flower. Do not make the mistake of supposing that you will necessarily be able to define the exact nature of the secret.

There are principles of architecture as absolutely reliable and yet as vague and ill-defined, as much "in the air," if you will allow the expression, as the laws which govern musical progressions or the methods which underlie true literary form. In no one of these cases can the subtle secrets of the art be distilled in the form of express and mechanical rules. If we desire that our own powers may be moulded and guided on true lines, we must, as it were, live in the storehouses, continually absorbing the spirit of the masters as embodied and expressed in their works. Centuries of experiment and criticism, generation after generation of trained perceptions and cultured intelligence, have gone to determine what is good, what is beautiful, what is true. Shall we throw away the results of all this? Rather let us recognize and admit that our knowledge should be based upon the experience of those who have gone before, and our taste trained and refined in the study of the cultured monuments of the past.

In all good work we shall discover a perfect blending of science and art, so combined that it is impossible to say where the one ends and the other begins. Where these are divorced there can be no true architecture. A steel-constructed building, for instance, cased with terra-cotta—or any other material for the matter of that—is not architecture at all.

In studying a building this is the first test to be applied; this is the standard to which we must first submit it for judgment. Do not begin by sketching or noting merely surface decorations or artistic embellishments; rather take the details of construction as your starting-point.

Note the size and bedding of the stones and the position of the joints—elements of beauty which are too often overlooked. Examine the methods of support and resistance, not thinking only of what is necessary, but also how it satisfies the eye. Discover the scientific and mathematical problems which have been successfully worked out. Yet do not even in thought separate the science and the art of the building—the two are conjoined, and must be studied together and simultaneously. The building must be solid and strong as well as graceful and pleasing. Stability is demanded no less than beauty. In fact, good construction, including the right use of materials, is a prime essential and the foundation of all excellence in architecture.

Nowhere, I think, is this more forcibly demonstrated than in the career and work of Sir Christopher Wren, who, both by education and the bent of his youthful genius, seems rather to have been of the scientific and mathematical than of the artistic order of mind. Though, like all educated men of his day, he took an intelligent and cultured interest in architecture, he received no special training for such work.

It is interesting to speculate what it was that finally drew all his wonderful gifts and powers into the service of architecture. Whether the determining impulse came from within or without—probably a bit of each—I cannot doubt that it was the scientific or constructive side of architecture that attracted him in the first instance, and that led him to accept an appointment as Assistant Surveyor-General of His Majesty's Works.

In our own experience we find cases where we are more impresed by the constructive beauty of a building than by any other feature in it. So there is an order of mind to which power and fitness of purpose appeal with unusual force, just as, again, a mathematical mind finds a fascination in the treatment of solids and voids and of superincumbent masses.

In conclusion I will briefly recapitulate some of these points. That which I have especially endeavoured to impress upon my brother students this evening is, that in addition to the ordinary architectural curriculum there must be a systematic and continuous study of buildings that are worthy, both ancient and modern. We must live in an atmosphere of art, breathe it in at the very pores of our skin, as the phrase goes, that it may act upon our own mental soil and render it productive.

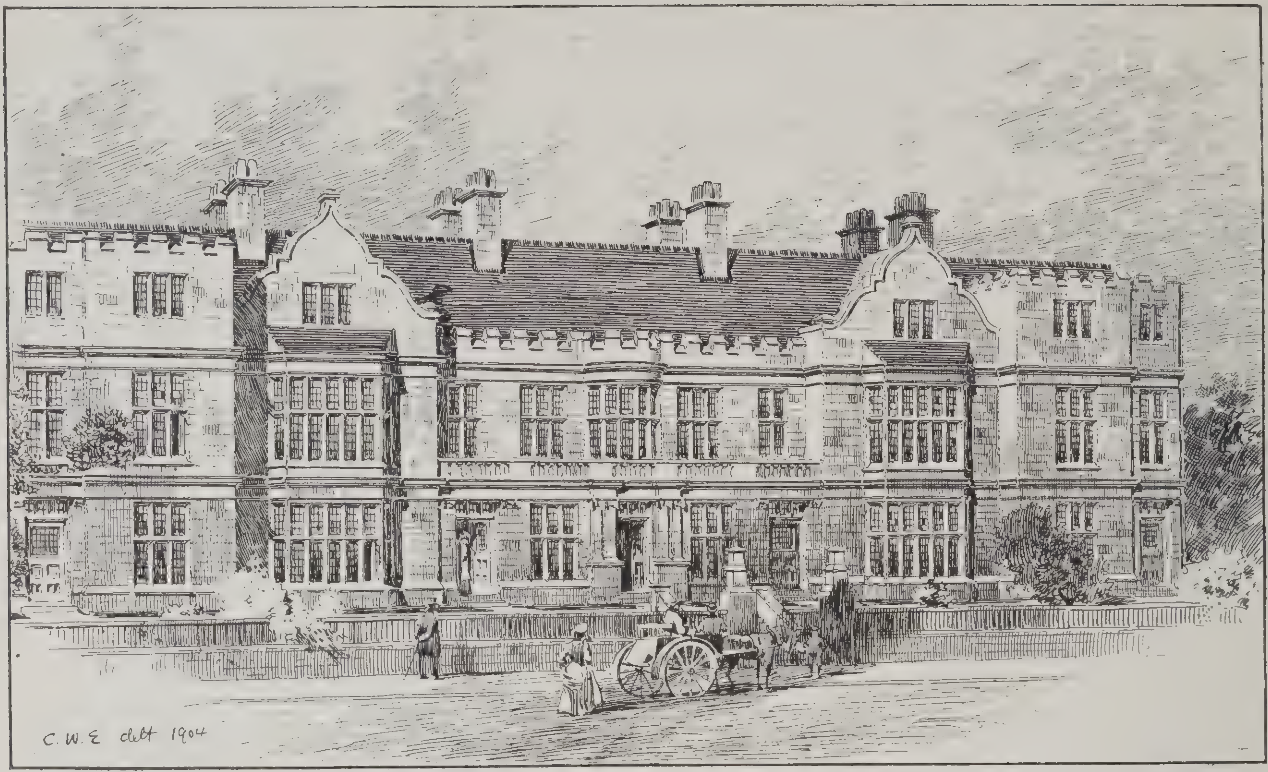
I have also urged upon you the importance of laying a good foundation in a practical knowledge of the art of construction and the right use of materials. This is the only solid, reliable basis for our art. Without such knowledge the keenest appreciation of the beautiful may be only thrown away; at the very best it is for ever fretting against the limitations and restrictions with which it finds itself encompassed. But if the practical, scientific foundation is well and truly laid, how great, how delightful, the field that opens up before the artist! His very fetters become his servants; the goad of a taskmaster becomes in his hand a tool for the accomplishment of all, and more than all, that his eye had conceived or his fancy dreamed of.

Let our ultimate ideal be the realization of those moral principles which are the dignity and power of architecture as they are of life—viz., simplicity and self-restraint, sincerity and directness of purpose. Without these we cannot but fail; with these we may accomplish something worthy of our art, and leave behind us work that shall be honourably characteristic of our time.

Mr. A. N. Prentice, in his criticism of the works submitted for the prizes and studentships, said:—I have always considered that a facility to draw well is the first makings of a great architect. Did not Michael Angelo impress on his pupils the importance of continually drawing? I know good drawing is not deemed of any great importance amongst some architects, but a visit to the gallery of the Alpine Club is sufficient testimony that our students think otherwise.

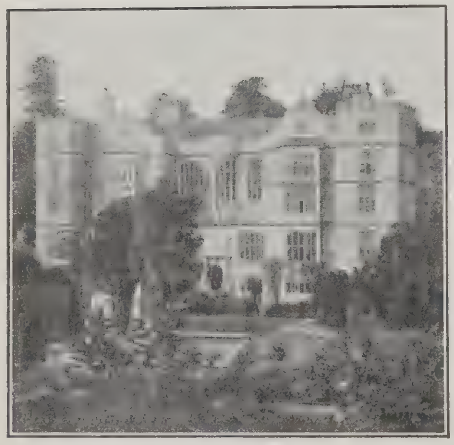
The designs this year for the Soane Medallion are of an exceptionally high order. Mr. Robert Atkinson, who receives the Tite prize, gives us an architectural fancy of great merit. Mr. James A. M. Hunter gains the Grissell Gold Medal with a design somewhat wanting in elegance and lightness.

A vote of thanks was passed to Mr. Belcher and Mr. Prentice on the motion of Professor Beresford Pite, seconded by Prof. W. R. Lethaby. The presentation of prizes was then made by the president.



The special interest in this building lies in the fact that the architect was instructed to produce a design after the model of Fountains Hall, a photograph of which is here given in order that a comparison may be made between the two.

TUDOR TERRACE, SEATON CAREW, WEST HARTLEPOOL. HARRY BARNES, A.R.I.B.A., ARCHITECT.



FOUNTAINS HALL.

WOLVERHAMPTON AND DISTRICT ARCHITECTURAL ASSOCIATION.

IN the course of his recent presidential address to this Association, Mr. Fred T. Beck said they should strive for the following principles:—

(1) That all works of a monumental character or national importance should be open for competition to all architects in the Kingdom on fair and reasonable terms and conditions.

(2) That all works under the jurisdiction of county authorities should be either competed for by those practising within the county or generally divided among them, as occasion arose.

(3) That works under municipalities should be given out in a similar manner among architects practising in such municipalities.

(4) That all salaried officials should confine their attention to works for which they were specially trained, and in no case to the carrying out of new buildings or extensions to existing buildings, but only to such alterations as might not involve enlargement, and, in the case of borough engineers, to street and drainage works pure and simple, including of course advising the council on plans submitted for their approval. Also, that a limit should be placed on the number of their staff—where engaged—according to the size and importance of the municipality.

(5) That in all cases where professional men were engaged the usual terms of payment should be observable in all respects, whether it was necessary for them to work in conjunction with the salaried official or not.

(6) That salaried officials should be allowed the privileges of taking pupils under certain restrictions and limitations.

INSTITUTE OF SANITARY ENGINEERS.

BY-LAWS under the Public Health Act of 1875 formed the subject of Mr. J. A. Crowther's (A.M.I.C.E.) presidential address to the Institute of Sanitary Engineers last week. These, he said, were designed to supplement and not to supersede the express provisions of the Statute law. In the Act and in the incorporated clauses the subject of by-laws might sometimes appear identical with those of specific enactments, but in all such cases a closer examination would show that the subjects were not really identical. A by-law was not unreasonable merely because the local authority had no power of dispensing with its application in any particular case. (See *Salt* v. *Scott Hall*, 1903, 67 J.P. 306, and *Pomeroy* v. *The Malvern Urban District Council*, 1903, 67 J.P. 375—which cases were given in full at the end of the president's address.)

Of course, there were exceptional circumstances all over the country, and it was exceedingly difficult, if not impossible, to draw up a set of by-laws applicable to all parts.

Mr. Crowther instanced Southampton as situated on a peninsula between the Rivers Itchen and Test. The portion of the down immediately adjoining these rivers rested on a bed of mud or silt from 30ft. to 40ft. thick. It was impossible to construct substantial buildings of brick or stone without having the foundation properly piled, which, of course, meant that a considerable amount of floor-space was necessary in order to draw out the lines of the intended structure. It was proposed to exempt such buildings from the by-law requiring them to be built of brick, stone, &c., &c. But no; the powers that were would not allow it.

Their association should assist in trying to form a comprehensive set of by-laws, with the necessary exceptions for the whole country, and in obtaining, in conjunction with other societies, some method of protection for sanitary engineers while carrying out their work in the interests of the public.

Architects’ Fees and Building Estates: Fryer (Palgrave & Co.) v. Flood & Sons.

To the Editor of THE BUILDERS’ JOURNAL.

LONDON.

SIR,—As I am sure this case, decided in the Court of Appeal on January 26th, cannot be ully appreciated by architects and surveyors, desire to set forth the facts in your columns, as from the expressions of surprise I heard rom several architects present in Court, I am convinced that the decision arrived at both by Mr. Justice Ridley and subsequently confirmed by the Court of Appeal is news of some importance to the profession, openng up an entirely new contingency amongst hose dealing with properties for development. To put it shortly, an architect (as distinguished from an estate agent) cannot ecover a fee or commission from a vendor—even though he has agreed in writing to pay t—when the architect (or surveyor) has inroduced a buyer ready and willing to purchase, or in fact does purchase, a property hrough the introduction of the architect, although the purchaser pay no fee or remuneration whatever for such introduction so that there is no question as to receiving commission on both sides, much less a secret one, to the detriment of the purchaser) even hough the would-be purchaser is agreeable and is aware a commission will be paid by he vendor to the architect for such sale, if—and here is the point –the purchaser has a verbal or written arrangement to employ the architect to develop the property so purchased and pays him strictly architects’ fees accordng to scale for purely architects’ work. He hen becomes the “client”in prospective.

It may be that, as in my case, there was no agreement in writing to employ the architect hereafter on completion of the purchase, so that should the purchaser die or in any way be unable to proceed with he development the architect gets nothing or his services for bringing about the sale of the property and putting a large profit in he pockets of the vendors.

In justice to the defendants I should say at once that the point of law propounded by the Court was not relied upon—or, indeed, put forward—by them in their defence to he action, but they relied upon the non-ulfilment of the contract note, which was as ollows:—

Frognal Hall and Priory Lodge.

Dear Sirs,

We shall not depart from what we said at our interview, namely, that if a contract is entered into with Mr. Mossop and a deposit of not less than £3,500 paid us we will then pay you £500, nothing otherwise. All hinges n our approval of the plan of development, and the sooner you send us this the sooner draft contract can go to your client.

Yours faithfully,
(Signed) FLOOD & SONS.

My case was this. My firm was asked by he defendants to find a purchaser for their state. After negotiations they finally agreed o accept £35,000 and to leave a portion of he money by way of mortgage, always provided they approved the plan of development and financial arrangements. It was herefore necessary for us to make preliminary plans for properties which were estimated to cost upwards of £200,000 at our own risk in case of non-approval by the vendors.

The basis of the contract was previously et out in correspondence between my firm and the defendants prior to the drawings being commenced, as we anticipated that after seeing our plans and ascertaining hereby what profit could be made by the development the owners might change their minds and want more cash. And this is just what happened.

The plans were prepared and duly approved by the vendors. At the same time we produced to them an arrangement in writing from a well-known insurance company to acquire the freehold ground rents as the estate was developed on our plans for £92,000, which they—the vendors—confirmed, as they had stipulated to do in the terms of sale.

Subsequently we approached a gentleman known to us—a solicitor dealing largely in properties—who agreed to buy the estate for £35,000 on the terms previously agreed between my firm and the defendants, and of course subject to the agreement as to the purchase of the ground rents being vested in him. This gentleman we introduced to the vendors as the proposed purchaser and, being accepted by them—they having approved the plans and arrangements for development—sent in the contract for purchase. This, however, was never signed by the vendors, but subsequently withdrawn by them without notice, although the would-be buyer was ready and willing to complete, as stated in evidence. I, therefore, having completed my part of the bargain and put the vendors into possession of my scheme, which showed where and how the profits could be made, claimed to be entitled to my commission whether they signed the contract or not.

Proceedings were subsequently taken by me for the recovery of the £500 commission, or as an alternative for “quantum meruit” or damages for preventing me earning the commission. The case was withdrawn from the jury by Mr. Justice Ridley on the ground that I, as an architect, could not recover this commission against the interest of the “client” and public policy.

The evidence of my principal witness, *i.e.*, the so-called “client” who was buying, was interesting as showing that he had no objection to my receiving the commission (as he was paying me nothing for introducing the business) and concluded from the first I was the “agent of the vendors,” and that he “did not consider himself the client of anybody.” Surely he ought to know.

Some architects deal with properties so often that I desire to point out that, notwithstanding they may have an agreement in writing with the vendor to pay fees for the sale brought about through their instrumentality, they cannot recover them, even with the knowledge and consent of the party buying who has not paid or agreed to pay any fee or reward for the architect so introducing the property, if it is proposed he subsequently acts for the purchaser and so becomes the “client.”

I do not recollect having heard of a similar case and am curious to know whether architects in future are to include in their fees of 5 per cent. the sale of building estates or contract themselves out of the law.—Yours truly,

CYRIL F. FRYER.
(PALGRAVE & Co.)

A Defence of the Buttress.

To the Editor of THE BUILDERS’ JOURNAL.

SIR,—Independent of style, architecture is indebted to the maturing by time for its greatest charm. It has often been rightly urged that no building can be fairly judged until ten or twenty years have wrought their effect on it. And for many it is only this softening by time which is the attractive element in architecture. To them all styles are alike; and the Tudor building, if it be well stained by storm, will have more effect on them than the purity of Salisbury. What they love is soot and rainwater judiciously applied. In contemplating the halls of the fifteenth and sixteenth centuries, with their long flanks of shallow bays, each with the typical window of the period, it is not so much Perpendicular work we are admiring as the general “scenic” effect. Such bays are formed by the buttresses projecting from the flank wall between each window. Structurally there to take a thrust, they have subsequently played an important part in mellowing the building. It is to them that we owe all that delicate shading by wind and rain which, unimpeded by such shields for breaking up the elements, would have swept the surface with one even tone. And so one has not summed up the buttress by saying it is there to receive thrusts. Without going so far as to advocate their use where structurally unnecessary, a little more latitude might be given when it is remembered that the tone of the wall will be affected. Architectural criticism has hitherto considered only the one point; but it should be remembered that what we are to-day questioning as to its utility will one day be forgotten in the contemplation of the whole, under that light and shade it has been so largely instrumental in producing.

Gothic architecture would not exist without the buttress; the system is based upon it. And it may often be difficult to decide whether so essential a feature is or is not absolutely necessary. Must everything be calculated to the last degree of probability? Cannot there be “factors of safety” even in buttresses? It is not unreasonable to expect some attention to be given to what effect Time will have on a building. Mere durability is taken into account; why not the ultimate face it will show? Why should all be left to Time without any co-operation from the architect?

To a certain extent the buttress, especially on a long flank, occupies a corresponding place to the column in classic architecture, and the shadows should, of course, be considered in designing each.—Yours truly,

MAX JUDGE.

7, Pall Mall, S.W.

[Our critical note last week on the use of buttresses was addressed to the practising architect, who must look at the question of design with a very different eye to the public, by whom the finished result is called attractive, delicate and other superlatives, because it is captivated with the effects of weather: the “soot and rainwater judiciously applied.” Criticism of architectural design is a difficult matter, requiring considerable technical knowledge in the critic and careful analysis; the personal taste (the product of so many wayward influences) of the public, the antiquarians, painters and others is of no value. The “attractive elements” in old buildings referred to by Mr. Judge were not intentionally produced by their designers. The buttress was used by the Gothic builders for reasons of constructive necessity. To many persons a piece of plain wall surface is just as “attractive” as if it were all broken up in the modern way traceable to nonsense about the “tone of the wall.” It is of course conceivable that in a monumental building the adequate expression of the functions may require some such expedient, but to imitate the buttress form which has been the outcome of resistance to thrust is bad art. Mr. Judge seems to confuse a buttress with a pier.—ED B. J.]

The Carpenters’ Company: Judges for Woodwork and Woodcarving.—The following have consented to act as judges in connection with the exhibition of works in wood and woodcarving to be held at Carpenters’ Hall in June next under the joint auspices of the Carpenters’ and Joiners’ Companies:—Mr. John Willson, J.P.; Mr. John Belcher, A.R.A. (president R.I.B.A.); Sir G. L. Molesworth, K.C.I.E. (president Institution of Civil Engineers); Sir Aston Webb, R.A., F.R.I.B.A.; Mr. George Frampton, R.A.; Mr. W. Goscombe John, A.R.A.; Mr. E. Guy Dawber, F.R.I.B.A. (president Architectural Association); Mr. E. Roscoe Mullins; the president of the Institute of Builders, and the president of the London Master-Builders’ Association.

VENTILATION.*

The Advantages and Limits of "Natural" and "Mechanical" Systems Compared.

By J. D. SUTCLIFFE.

THE science of ventilation is a big subject, and no system is suitable for all buildings and every circumstance. It is a pity that in recent discussions real issues have been kept back by those commercially interested in some particular system, who have strung perverted quotations together to prove their own case or to damage other systems. As a case in point, no doubt many of you have received a little blue book purporting to be a report on the House of Commons' ventilation in which it is sought to prove that a Committee of the House of Commons decided against mechanical ventilation, whereas their recommendations were (1) to increase the size of the fan propelling fresh air into the House, and (2) to fix fans for exhausting the air, instead of heated upcast shafts, which had been in use up to that time.

Holding no brief for either the "mechanical" or "natural" systems, I propose to place before you the advantages and limitations of both so far as my experience and practice will allow.

Ventilation Defined.

Ventilation has been variously defined, but I take it that all reasonable men are agreed that it is the passing into and through a room of sufficient fresh air to keep the air in that room reasonably pure and fit for use. Fortunately, in judging the purity of air breathed in rooms it is not necessary to determine more than the amount of CO_2 present, as this forms a sufficient indication of its quality.

How to test Air for Purity.

In 1802 Dalton devised a method which, improved later by Pettenkoffer, is still in use by chemists for exact determinations. To those who have no chemical knowledge I can recommend the apparatus illustrated in Fig. 1.

Each of the tubes shown contains an equal amount of a weak solution of baryta and alkali, coloured pink with the indicator phenol-phthaleine, and as the acid in the air acts on the baryta and neutralizes it the pink colour gradually disappears. In using the apparatus, one of the tubes is connected to the can filled with water, and by an arrangement of piping the water is drawn off, causing the air by which it is displaced to pass through the solution, the amount of air passed through being measured by the amount of water run off.

This is done inside the room tested and also outside in the free atmosphere, and it can readily be seen that if it requires only one-third as much air to decolorize the solution inside the room as outside, the air in the room must contain three times the impurity present in normal air.

Standards of Efficient Ventilation.

In specifying satisfactory ventilation it is not enough to merely prescribe a certain air-space per person, though this is good, or even to fix a certain supply or renewal of air per person, though this is better, but in all cases a standard of CO_2 should be definitely fixed. In schools a cubic space of 120ft. per child is deemed sufficient by our educational authorities, who do not realize that the place for children is in the open air; and if this is not possible then they should have the nearest approach to it that can be given. In factories the minimum space for each worker varies from 250 to 500 cub. ft., according to the healthiness or otherwise of the trade. All authorities are agreed that 3,000 cub. ft. of fresh air per hour is necessary for a man if he is to breathe reasonably pure air. The standard in the Massachusetts and most American schools is 2,000ft., whilst in our own schools we have no standard whatever.

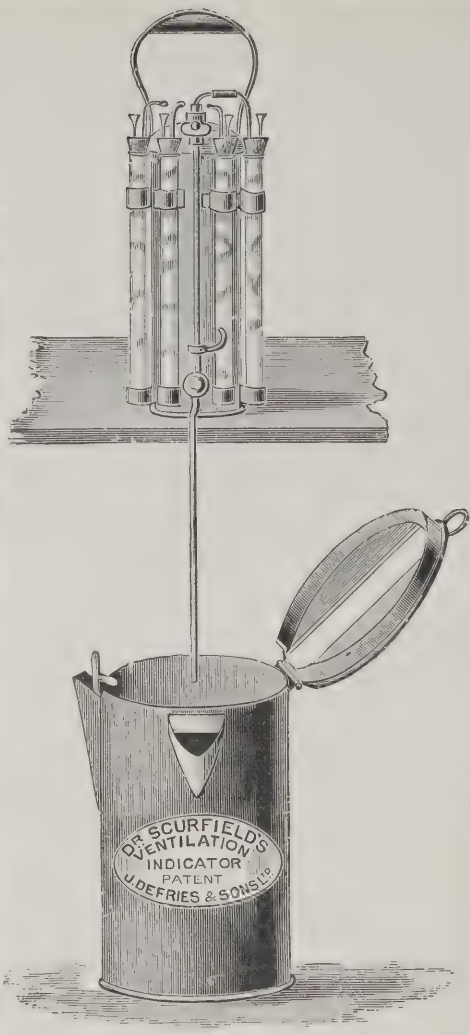

FIG. 1.—DR. SCURFIELD'S AIR-TESTING APPARATUS.

Now with regard to the standard of purity which ought to be maintained. In cotton cloth factories where artificial humidity is used the CO_2 must be kept down to below 9 parts in 10,000 parts of air, and so far as I know these factories are the only buildings in the United Kingdom compelled by law to ventilate to a definite standard of purity. My own idea is that the ventilating engineer should aim at a standard of 5 or 6 parts of CO_2 under normal conditions and 9 parts of CO_2 as a maximum under any circumstances.

There is not the least difficulty in keeping the CO_2 in any room down to below the standard required by the cotton cloth factory Act. This is shown clearly by the report of Mr. Scudder, the chemist who was recently requested by a committee of employers and employees to take samples of air from thirty different factories. In all Mr. Scudder took 287 samples and found that only five exceeded the amount allowed by the Act. Further proof is given on p. 161 of the chief factory inspector's report for 1903, where the results of more than fifty different tests are given. Some are as low as 4·6 parts of CO_2, the majority between 6 and 8 parts, and only nine above the standard allowed.

It seems somewhat hard on cotton cloth factory owners to be compelled to keep the CO_2 down to 9 parts in 10,000 of air, when it is safe to say there are very few schools in England (certainly not 5 per cent.) that would pass the same test two hours after lessons had commenced and there are many schools where the CO_2 reaches 18 or 20 parts per 10,000 before the end of the afternoon. The nose is usually an excellent guide to the presence of impure air, as when anybody fresh from the outside enters a room a faint smell is perceived if the air contains 7 parts of CO_2 per 10,000, and when it reaches 8 or 9 parts we usually say the room is "close."

Natural or Automatic Ventilation.

"Natural" ventilation is not the correct term to use in the sense that it is used to-day by all the makers of cowls who arrogate to their own particular system the word "natural." A much better term is "automatic" ventilation, to distinguish it from "mechanical" or "fan" ventilation. My idea is that the only "natural" ventilation is outside a building in the fresh sunlit air of heaven.

The Song of the Open Window.

Of all kinds or systems of ventilation my preference is for the open window. Some of my hearers may say what has the science of ventilation to do with this, but the ventilating engineer, if he is wise, thinks a good deal of the open window, and in my opinion there is no system either automatic or mechanical to compare with it. I preach this gospel in season and out, and practice it with great benefit to myself and my family.

We have been told so frequently that if we sit in a draught we shall catch cold that we have come to believe it, whereas the true explanation of why we "take cold" is a very different matter. A cold is a germ disease, and the surest way to resist an attack is to be surrounded by pure air. I never catch a cold unless I am compelled to stay in a close and stuffy atmosphere, such as we sometimes get in a dining-car, where the windows are not allowed to be open, or in a crowded hall or theatre. When the vital forces are lowered by breathing impure air disease germs gain an advantage over otherwise healthy tissues and rapidly spread their baneful effects over the whole system, and this is how we catch "cold."

I am going to go further and say not only draughts are not dangerous but since they are inseparable from a constant and plentiful supply of fresh air they are to be cultivated. Look at the thousands of consumptives who are now living this open-air life. If anyone suffered from it surely these frail mortals would.

Automatic Ventilation.

Returning again to automatic ventilation, this can as a rule be very well applied to an ordinary house. Fig. 2 (next page) shows a ground plan of my house with the warming and ventilating arrangements clearly marked. There are two hot-water radiators fixed in the hall, one near to the inner door, and the other at the side of the staircase, while there

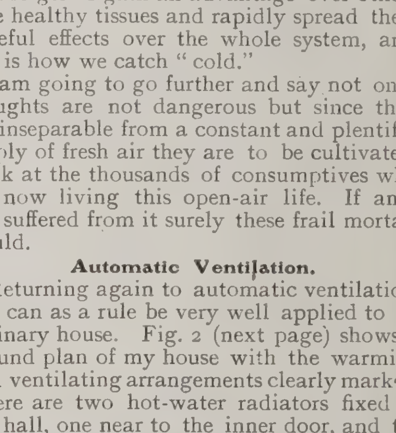

FIG. 3.—VENTILATING RADIATOR.

---

* The greater part of a paper read before the Institution of Heating and Ventilating Engineers on January 17th, 1905.

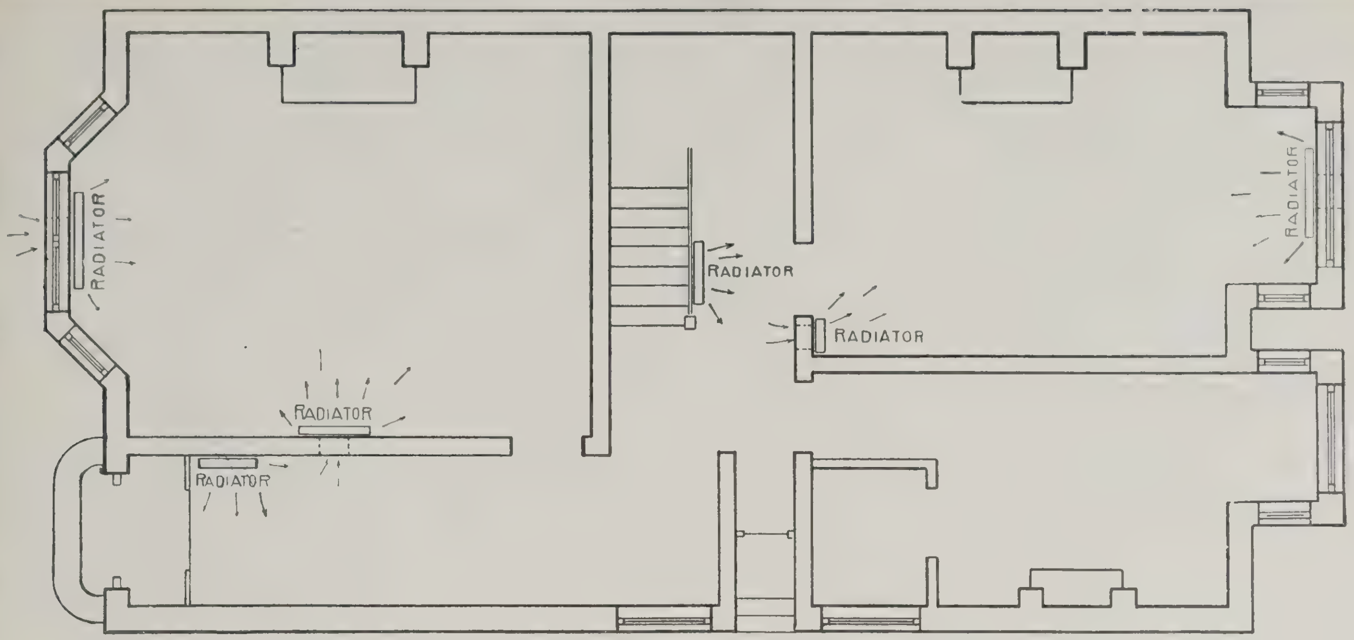

FIG. 2.—GROUND PLAN OF HOUSE WITH BEST POSITIONS OF RADIATORS.

are also radiators under each window and one in each room with their backs to the hall. The four radiators in the rooms are all of a ventilating pattern, as Fig. 3, the two under the windows having fresh air brought to them from the outside and the other two from the hall, where it is always fresh and pleasant. I have also fixed an outlet near the ceiling, and this is an excellent plan of taking off the products of combustion from the burning gas.

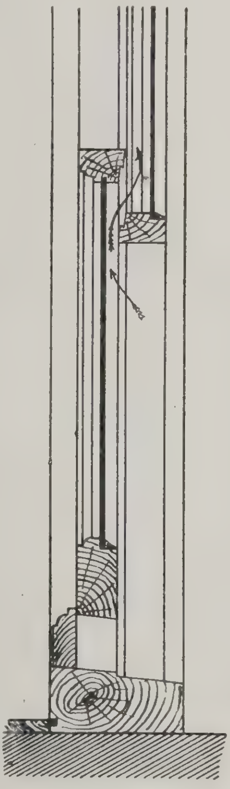

FIG. 5.—WINDOW AIR INLET.

Air Inlets.

I am not greatly in favour of the ordinary Tobin tube. It is unsightly, and if of sufficient length to be of any use it is difficult to keep clean. I much prefer air-inlets of the type shown in Fig. 4 below). If these are fixed about 6ft. 6ins. from the floor they answer their purpose well.

Window Inlet Ventilation.

Better than these, however, is the window inlet shown in Fig. 5. A piece of wood, say 3ins. deep and the width of the window, is fixed opposite the bottom rail of the sash. Then the bottom sash is raised to the height of the inserted piece of wood and air enters the room at the meeting bars in the direction shown by the arrows, and a very efficient inlet is at once provided. Whatever is claimed for the ordinary Tobin tube may be reasonably claimed for this simple window inlet.

Window Outlet Ventilation.

I should like to mention here a point in the construction of windows that I think is worth attention. All windows should be carried up to the ceiling level, so that when they are opened at the top the heated and vitiated air of the room will have a much better chance of escape than if the top of the windows were 18ins. or 2ft. below the ceiling.

Schools or Other One-storey Buildings.

Schools or similar buildings of reasonable size and width can be very well ventilated by automatic appliances, but to ensure a thoroughly satisfactory system of automatic ventilation the school should be only one storey high and not more than 30ft. wide. The warming and ventilation should be combined. The best plan is to use single-flue ventilating radiators fixed under each window, with fresh air admitted behind each radiator. If the weather is suitable the windows can be opened for additional air supply, and the only other thing necessary is a series of good-sized outlets at the ridge of the roof.

Air Outlets.

It is frequently claimed by manufacturers of patent cowls that their particular make will produce strong extraction currents of air in all weathers. This is a claim I have never been able to substantiate, and in my experience the best roof ventilator is the one which allows the air to pass out with the least obstruction and yet is weather-tight. Years ago I assisted in testing some large Archimedean screw ventilators on the roof of the Manchester Art Gallery. Some had rusted fast and would not revolve, while others whirled round merrily when any wind blew. We fixed anemometers under several and found that the ventilators which were stationary allowed more air to pass out than the revolving ones, and Mr. Allison, the late city surveyor, had them all fastened.

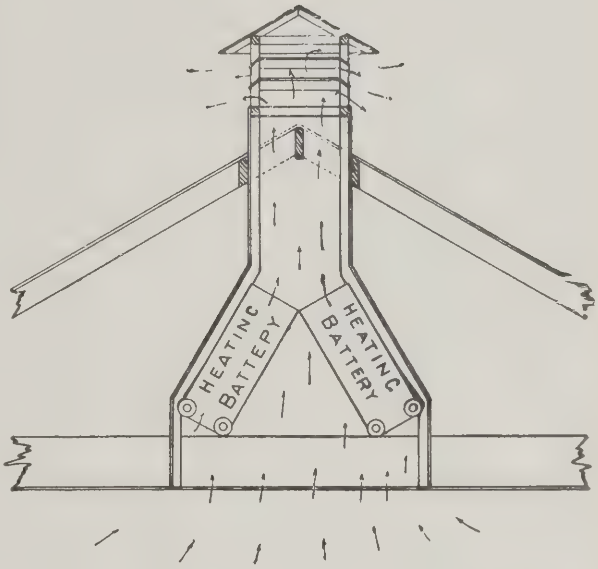

FIG. 6.—AIR OUTLET, WITH HEATING BATTERY.

If a really effective automatic extractor is wanted, heat will have to be used in one form or another. A good-sized Bunsen burner fixed just above the ceiling line in an outlet turret is a help, but a better arrangement is to use a special heating battery fixed as shown in Fig. 6. Such an outlet really gives extracting power, and with it there is no possible chance of a down-draught. I must warn you that it is not safe to heat such a battery from a hot-water supply on account of the considerable danger of freezing and bursting in frosty weather. Steam is the only suitable heating medium.

Hot-Water or Steam-Heating.

This brings me rather sharply to the question of the advantages and disadvantages of steam and hot water for heating purposes.

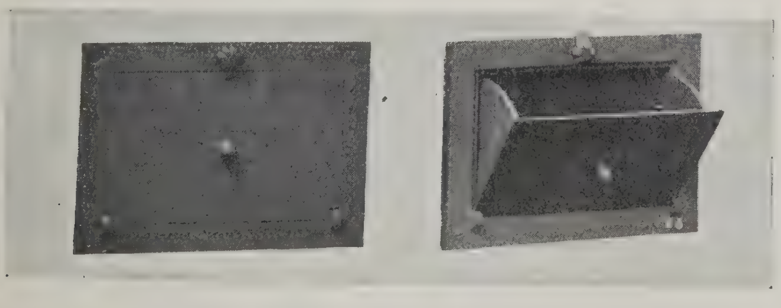

FIG. 4.—SIMPLE FORM OF AIR INLET.

Personally I prefer hot-water radiators for private houses, offices and other rooms that are not overcrowded but are usually occupied by the same number of people. With hot water, however, larger heating surfaces are required to get the same temperature effect, and also much larger pipes, while another disadvantage is that the heat is not so readily controllable. Using steam you will have useful heat from the radiators within an hour after lighting the boiler fire, whereas with hot water several hours usually elapse before any heat is available. There is also the corresponding drawback when you want to shut off the heat quickly. Directly the control valve is turned off the heat disappears when steam is used, but in a hot-water installation the heat remains a long time in the radiators and the overheating may become serious. Where at one time you have a building crowded out and at another time the same building less than half full, it is essential to use low-pressure steam, as it is so much more amenable, and you can raise or lower the temperature to suit the conditions in a few minutes. Then, again, in cold and frosty weather hot-water pipes are liable to burst if the apparatus is out of use for a few days, whereas with steam this cannot happen. One advantage of hot-water heating is that the temperature of the radiators or other heating surface is lower than with steam-heating, so that the air is not raised to such a high temperature, but with low-pressure steam-heating the difference is comparatively little. In no case do I recommend high-pressure steam-heating, and in my opinion 2 to 5 lbs. is quite as high as it is necessary or desirable to go.

Churches

are also buildings in which it is better to use a natural or automatic system rather than a mechanical or plenum system, and they can be warmed quite well on the lines laid down for small schools. The chief difficulty is the cooling of the air by the large windows and the roof, which causes considerable down-draughts. These can be avoided or minimized by using steam batteries in the roof outlets, as previously illustrated, and running one or two rows of small steam pipes round the church at the level of the eaves. If hot water is used for heating it is a very simple matter to use also a small separate steam boiler specially for the ventilation. What one should particularly avoid in the heating of a church are the usual channels sunk into the floor with steam pipes in them and gratings over. They are always foul receptacles for dust and dirt, and can never be properly cleaned.

I should have liked to have touched upon several other points in automatic ventilation, but will content myself by just a line in reference to the ventilation of

Lavatories and W.C.'s.

The usual plan of opening the windows and allowing the foul air to blow through the door and all over the house is not to be recommended. A better plan is to have an air inlet in the bottom rail of the door, or failing this to have the door shortened so that there is clear air-space under the door for its full width and 1½ins. deep. Then take the outlet through the wall at the highest point opposite the door. On the outside of the outlet have a protecting cover as shown in Fig. 7. Of course in a new building an outlet flue should be built in the wall and carried up to the roof.

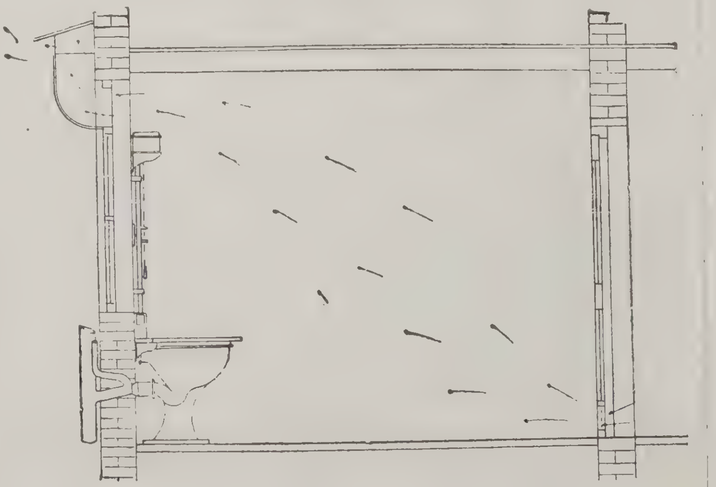

FIG. 7.—AIR INLET AND OUTLET FOR W.C.'S.

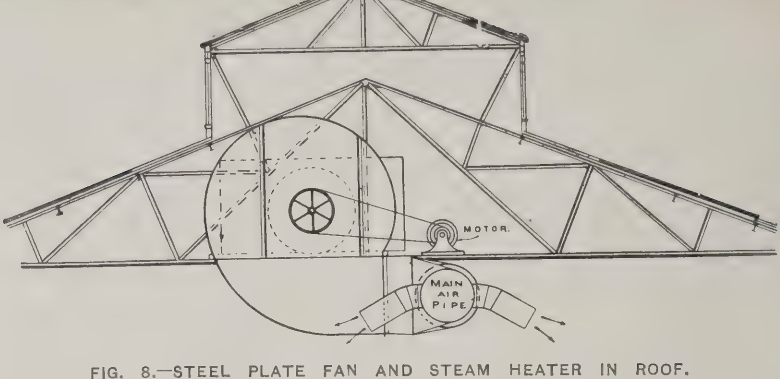

FIG. 8.—STEEL PLATE FAN AND STEAM HEATER IN ROOF.

Mechanical Ventilation.

Many of the difficulties that are met with in automatic ventilation disappear when fans are used. The necessary amount of air is obtained by simply choosing the right style and size of fan, and driving it at the proper speed. The only problem—a serious one, I grant—then lies in the correct distribution of the air.

Air-distributing.

The movements of air currents have not been sufficiently studied, and I think sometimes it is a misfortune they are not visible. If fresh air were coloured blue, and when it became foul it blushed a delicate pink, we should be able to deal with it better. I know a great many halls, schools and other rooms where there would be a good deal of blushing. At present, unfortunately, we know very little of the behaviour of air. The difficulty with all air currents is in controlling their direction. For instance, if you admit air into a room, say, on a side wall at 6ft. 8ins. from the floor, and direct it upwards to the ceiling, what happens? Well, that will depend on the temperature of the incoming air in relation to the air in the room, and will constantly alter as the temperature and velocity vary. If the air enters at considerably higher temperature than that in the room the warmer air will go to the ceiling and probably diffuse itself there, travelling along to the opposite wall and then cooling and coming down or passing out at any opening that may be provided. If the admitted air should be colder than that in the room it will probably never reach the ceiling, and will certainly not cross the room unless a fan pulls it, and even then it may travel along the floor. Of course, any intermediate stages of warmth will give intermediate stages of direction and velocity.

Velocity of Air Currents at Inlets.

The velocity of air coming into a room has a great deal to do with the comfort of the occupants. Ventilating engineers generally say that if the velocity does not exceed 5ft. per second there is no perceptible draught. This needs qualifying, as a great deal depends on the occupants. A thin spare man who takes little out-door exercise can feel a draught where a healthy man feels none, and until some device of enveloping each man in his own particular temperature and in his own pet air current is introduced it will be difficult to suit everybody. With all systems of automatic ventilation there is the difficulty of keeping the velocity of air constant. If a strong wind is blowing on one side of the building the air enters the inlets on that side much more rapidly than it does on the leeward side or on a still day.

I remember discussing some ventilating plans of a new technical school with an architect, who told me he had decided to adopt a certain scheme because the ducts and air-inlets were so much smaller than in any of the other plans. He instanced a room for twenty pupils with an inlet only 6ins. square and pointed to the difference between this and another plan where the inlet was 18ins. square for the same room. I told him that if 3,000 cub ft. of air per hour per pupil were supplied the velocity at the inlet would be 66·6ft. per second, whereas with 18ins. square it would only be 7·4ft. per second. On the other hand, if the velocity were to be kept down to 4ft. per second each poor pupil would only get 180 cub. ft. per hour, whilst with the larger inlet they would each get 1,620 cub. ft. per hour. Many ventilating contracts have no doubt been given out for similar reasons, but no architect is likely to make such a serious mistake more than once.

Engineering and Printing Works.

The modern engineering, printing and similar works are built, as a rule, only one storey high. They cover a great deal of ground, and it is not possible to keep the air fresh and sweet in the centre of the rooms with ordinary air inlets in the walls. Frequently there are travelling cranes overhead, and steam pipes and air ducts must be kept clear of these and can only run parallel with the cranes and not across their path.

In such cases it is necessary to fix any heating and ventilating plant well clear of the cranes, shafts and belts, and sometimes the fan and heating battery are placed in the roof as shown in Fig. 8, where they cannot cause any obstruction. More frequently, however, the fan and heater are fixed on the floor, and the distributing air ducts or pipes are carried in the most convenient positions for supplying the whole of the works with fresh air warmed to suit almost any conditions of temperature that may be required.

One incidental advantage of this system of heating is that when the works are being warmed up on a cold morning and before work is started the inlet for fresh air from the outside to the fan may be shut off, and the fan can draw its air actually from the rooms it is heating. This circulating of warm air greatly reduces the time taken to heat up the works to the required temperature.

(To be concluded.)

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Strength of Concrete Steel Lintel.

STUDIO writes: "A concrete lintel is composed of 1 part of best Portland cement, 2 of well-washed coarse sand and 3 parts of clean screened gravel and hardstone broken to pass a ¾in. ring; size 12ins. by 12½ins., 9ins. bearing at each end, and having three angle steels 2½ins. by 2ins. by $\frac{5}{16}$in. embedded 1ins. from underside and ends; span 9ft. 3ins. Would this be sufficient to carry a load of 11 tons distributed? A method of calcuating for armoured concrete lintels, &c., would be esteemed. Please name a good book on graphics and architectural ornament for a beginner."

No very precise estimate of the strength of concrete steel beams can be made. This is so even when the estimate is made by the ame person, while when done by different people the results are certain to vary coniderably. The section shown in Fig. 2 would probably be more suitable than that uggested by you, shown in Fig. 1. There re various formulæ which accord with the xperiments upon which they were based, ut they appear to be of little use for general work. We may take first

$$W = \frac{at^2}{L^2}\left(570 - 2500\frac{a}{t}\right) - \frac{t}{10},$$

here W = safe external load in cwts. per oot run, a = sectional area of steel reinorcement in square inches, t = thickness of oncrete above centre line of reinforcement, = span in feet. Then for section Fig. 2

$$= \frac{2{\cdot}38 \times 10{\cdot}283}{(9{\cdot}25)^2}\left(570 - 2500\frac{2{\cdot}38}{10{\cdot}283}\right) - \frac{10{\cdot}283}{10}$$

$= {\cdot}286(570 - 578{\cdot}62) - 1{\cdot}0283 = -2{\cdot}4653 -$ $0283 = -3{\cdot}4936$; but as the result is a minus uantity it has no meaning, and therefore e formula does not apply. By another rmula, condensed from the "Building ews" of June 24th, 1904, $M = \frac{1}{3}pa^2e + tsb$,

$$= \frac{20s}{e}\left(-1 + \sqrt{1 + \frac{s}{12eh}}\right),\ b = h - \tfrac{1}{6}h - a,$$

here M = bending moment in inch-lbs., a = e distance from neutral axis to most remote bre in compression, p = the unit compressive train on the concrete, say 500 lbs. per. sq. in., = the width of the beam, h = the height the beam, t = the unit tensile strain on e steel, say 16,000 lbs. per sq. in., s = the area of the steel, b = the distance from the neutral axis to the centre of action of the steel, which should be placed at five-sixths of the total depth. The neutral axis of the tee-section proposed will be as shown in Fig. 3, ·717 above base, and therefore $\frac{12}{6} - {\cdot}717 =$ 1·283in. above underside of concrete to give a depth of five-sixths to the centre of action. Then

$$a = \frac{20 \times 2 \times 1{\cdot}19}{12{\cdot}5}\left(-1 + \sqrt{1 + \frac{2 \times 1{\cdot}19}{12 \times 12{\cdot}5 \times 12}}\right)$$

$= 3{\cdot}80(-1 + \sqrt{1{\cdot}0013}) = 3{\cdot}8({\cdot}001) = {\cdot}0038$,

$b = 12 - \frac{12}{6} - a = 12 - 2 - {\cdot}0038 = 9{\cdot}9962$,

$M = \frac{1}{3} \times 500 \times a^2 \times 12{\cdot}5 + 16000(2 \times 1{\cdot}19)$

$b = {\cdot}0301 + 380655{\cdot}3$ and $M = \frac{wl}{8}$,

$$\therefore W = \frac{8M}{l} = \frac{8M}{111} = \frac{3045242{\cdot}4}{111}$$

= 27,435 lbs. = 12·25 tons safe load distributed. Although this appears satisfactory, it may be a pure accident, as the allowance of 500 lbs. per sq. in. for working stress in compression of concrete seems to the writer to be excessive—about four times greater than it ought to be. It would be equivalent to $\frac{500 \times 144}{2240} = 32{\cdot}143$ tons per sq. ft. The New York building regulations give the ultimate compressive strength of ordinary concrete as 350 lbs. per sq. in., and moreover the calculations show the distance from the neutral axis to the top of the beam as only ·0038in., which is inconceivable, so that this formula seems no better than the last. Wilkinson's formula for concrete-steel floors may be applied to this case as follows: $W = \frac{12t^2}{S^2}$, where S = span in feet, t = thickness in inches, W = safe load in cwts. per foot run. Assuming that the concrete is 4 to 1 Portland cement, except for the top inch, which is to be 2 to 1, and that the steel reinforcement is $\frac{1}{60}$ of the total area and placed in the lower half, then $W = \frac{12 \times 12^2}{9{\cdot}25^2}$ = 20 cwts. per foot run, $\frac{20}{20} \times 9{\cdot}25 = 9\frac{1}{4}$ tons safe load. But the total sectional area is 150 sq. ins., and one-sixtieth of this would be $\frac{150}{60} = 2{\cdot}5$ sq. ins., while the actual section of steel proposed is only $2 \times 1{\cdot}19 = 2{\cdot}38$ sq. ins., so that the section would be more in agreement if made $2\frac{1}{2} \times 2\frac{1}{2} \times \frac{5}{16}$. This formula does not profess to be more than a close approximation, and the safe load is still below the required amount of 11 tons. Without trying any more formulæ the writer would be content to use three $2 \times 1\frac{1}{2} \times \frac{5}{16}$ steel tees, as in Fig. 4, if the load is imposed by a brick wall. For a full study of the subject as at present known see Marsh's "Reinforced Concrete," 31s. 6d. nett. from these offices. The best book on graphics for a beginner is Hardy's "Graphic Statics" (3s. nett.); for architectural ornament see THE BUILDERS' JOURNAL Book List No. 2.

HENRY ADAMS.

Fig 1

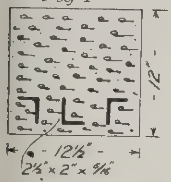

Fig 3

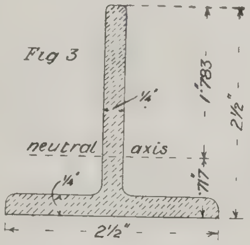

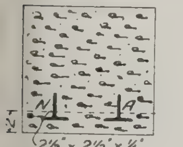

Fig 2

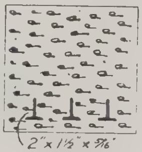

Fig 4

Gallery Cantilever.

CHELTENHAM.—J. J. L. O. writes: "The diagram (redrawn) represents a cantilever supporting seats in a gallery. What pressure do these loads cause upon column and wall respectively?"

In this case it is assumed that the loads given include an allowance for the weight of the structure, and the following analysis would then be sufficient to make the preliminary design from. For the projecting portion, 6 tons × 10ft. from support to centre of gravity of load = 60 ton-feet bending moment at supporting column, the intermediate ordinates being given as a parabola, as in Fig. 2. For the horizontal portion $\frac{wl}{8} = \frac{4 \times 10}{8} = 5$ ton-feet for the bending moment in centre due to direct load, but the upward pull from the cantilever will be very largely in excess of this, and will be shown by ordinates to the line joining the termination of the previous ordinates with the centre of bearing in wall, diminished by the parabola due to the downward action of direct load. The anchorage at the wall end must be sufficient to counteract an upward pull of $\frac{10\text{ft.} \times 6\text{ tons}}{11\text{ft.}} = 5{\cdot}\dot{4}\dot{5}$, say 5½ tons, and the column will have to support $6 + 4 + 5{\cdot}\dot{4}\dot{5} = 15{\cdot}\dot{4}\dot{5}$, say 15½ tons. The shear stress diagram will approximately be as shown in Fig. 3. At the column there will be a load of 6 tons supported on the one side and $9{\cdot}\dot{4}\dot{5}$ tons on the other. The 6 tons will be reduced uniformly to zero at the outer end, and the $9{\cdot}\dot{4}\dot{5}$ will be reduced uniformly at the same rate to $5{\cdot}\dot{4}\dot{5}$ tons at the anchorage.

HENRY ADAMS.

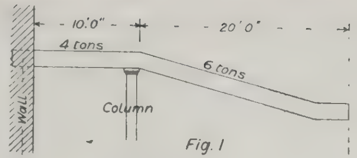

Fig. 1

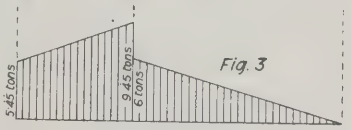

Fig. 3

Expenses in Connection with Sale of House.

EALING.—WORKS writes: "I have a house which I want to sell for £285, leasehold, ninety-six years unexpired. I have a building society mortgage for £225, of which £24 is paid off. What expenses should I be put to in the event of a sale?"

The stamp duty on such a conveyance would be 2s. 6d. for every £25 of the purchase money. The costs of vendor's solicitor would be 30s. per £100; making a total of 30s. for stamps and 90s. for costs. I think, however, that it is probable that you will find, on enquiry of the secretary of your building society, that they have a scale of fees which works out at less money than this.

F. S. I.

Dry-rot: Landlord and Tenant.

LIVERPOOL.—X. writes: "A client signed a lease of a house for a period of three years (ordinary wear and tear excepted). At the expiration of 2½ years dry-rot appeared in all the floors on the ground level. The tenant called upon the landlord to put the house in a habitable state. The landlord demurred at first but finally agreed, and the whole of the floors were taken up and renewed, extra ventilation, which was badly required, being provided. The landlord then sent the bill to the tenant for payment. The tenant took no notice of it, and now the landlord has sued him for payment in the county court. What is your opinion of the matter?"

The answer to this question depends in a very large degree upon the exact wording of the lease, but assuming the covenants are those usual in a lease for a period of three years, I am of opinion: (1) That the lessor (landlord) is under no obligation to repair at all (unless expressly undertaking to do so). (2) That the lessee (tenant) accepted the premises at the commencement of the term and cannot go behind that acceptance at any subsequent period. (3) That the fact that the repairs in question became necessary on account of decay and by reason of no act of the lessee makes no difference, he is liable to repair just the same, due regard being had to the age and character of the premises. (4) "The landlord demurred at first, but finally agreed." Of course I cannot tell quite what this means, and only examination of the correspondence can determine. It may be that the lessor has agreed to waive (to some extent at least) the repairing covenant of the lease, and it is just possible that this may help your client. A solicitor having all the documents before him could no doubt give an authoritative opinion. F. S. I.

Obituary.

Mr. G. Weller, builder, of Arundel, died on February 1st, aged 47.

Mr. Walter Aston, F.R.I.B.A., of Manchester, died recently, aged 44.

Mr. T. E. Morgan, builder and contractor, of Brecon, died recently, aged 55.

Mr. Thomas Bastiman, builder, of Middlesbrough, died recently from injuries sustained by falling into some excavations at Guisborough.

The late Mr. W. T. Richardson, of the firm of Mesrss. A. & W. Richardson, cement makers and brick merchants, Vauxhall, left estate of the gross value of £44,013.

Mr. A. L. Mitchell, builder, of Alloa, Edinburgh, died recently. Born in 1820, he began business sixty-two years ago as a joiner and builder, and built up a large and most successful business.

The late Mr. J. T. Wimperis, F.R.I.B.A., who died on December 21st, left estate which has been valued at £51,430. Amongst other bequests he left £1,000 to the R.I.B.A. for promoting the knowledge of architecture, and £50 to the Architects' Benevolent Fund.

Mr. James Barnet, a native of Arbroath, died in Sydney on December 10th last. He had been in Australia for fifty years, and was 77 years of age. He was Colonial architect for New South Wales from 1865 to 1890. Amongst the works carried out by him in Sydney were the general post office, the museum, customs house, public library, medical school, and land schools to the Sidney University.

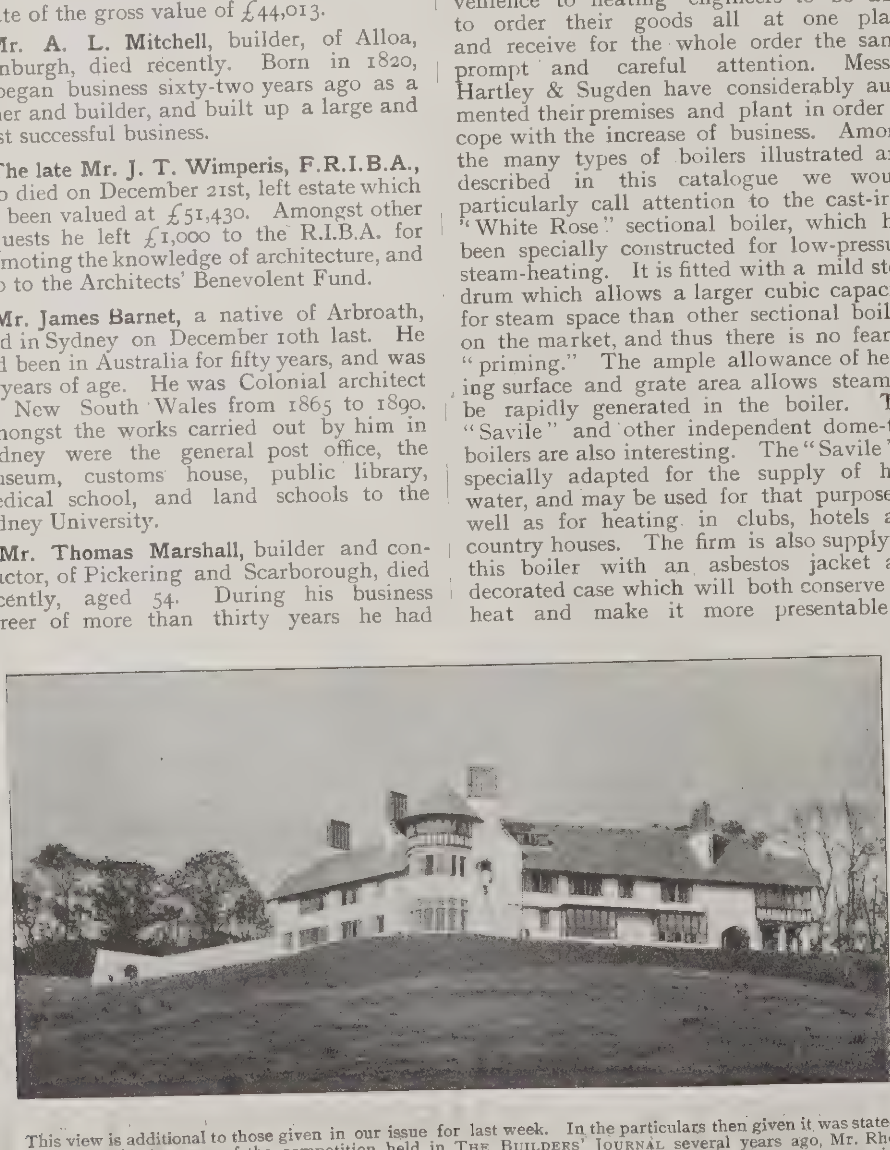
Mr. Thomas Marshall, builder and contractor, of Pickering and Scarborough, died recently, aged 54. During his business career of more than thirty years he had charge of many extensive contracts in the building trade in different parts of Yorkshire, and had done much in the building of house property at Scarborough. The firm of which he was the head is completing the new grammar school at Pickering for the governors of Lady Lumley's charity.

Mr. Richard L. Boulton, senior partner in the firm of Boulton & Sons, architectural sculptors, Cheltenham, died recently, aged 72. As a young man he executed a great deal of sculpture work for the cathedrals of Worcester, Hereford and Lichfield, under the direction of the late Sir Gilbert Scott, R.A., but for the past twelve years he had been living in retirement at Bournemouth. Among his last works were the statues on the high altar screen of Winchester Cathedral; also work at the Bombay Courts of Justice, Northampton Town Hall, and Keble College, Oxford.

Trade and Craft.

Boilers for Heating, &c.

Messrs. Hartley & Sugden, Ltd., who specialize in boilers, radiators, &c., for heating purposes, have just published a new catalogue which contains most useful notes and memoranda for heating engineers. This firm is, so far as we are aware, the first and only makers to supply both wrought-iron and welded heating-apparatus boilers, cast-iron sectional boilers and radiators. It is apparent that it is a great convenience to heating engineers to be able to order their goods all at one place and receive for the whole order the same prompt and careful attention. Messrs. Hartley & Sugden have considerably augmented their premises and plant in order to cope with the increase of business. Among the many types of boilers illustrated and described in this catalogue we would particularly call attention to the cast-iron "White Rose" sectional boiler, which has been specially constructed for low-pressure steam-heating. It is fitted with a mild steel drum which allows a larger cubic capacity for steam space than other sectional boilers on the market, and thus there is no fear of "priming." The ample allowance of heating surface and grate area allows steam to be rapidly generated in the boiler. The "Savile" and other independent dome-top boilers are also interesting. The "Savile" is specially adapted for the supply of hot-water, and may be used for that purpose as well as for heating in clubs, hotels and country houses. The firm is also supplying this boiler with an asbestos jacket and decorated case which will both conserve the heat and make it more presentable in appearance in such situations as passages or halls. The old lists of approximate heating powers we are glad to see discarded in this catalogue and lists of actual heating powers based upon careful observation in actual work substituted. It is calculated that 1 square foot of direct heating surface will heat with economy, under average conditions, 35ft. of 4in. pipe, and the flues in proportion. The address of Messrs. Hartley & Sugden is—Atlas Works, Halifax.



This view is additional to those given in our issue for last week. In the particulars then given it was stated that the design was the outcome of the competition held in THE BUILDERS' JOURNAL several years ago, Mr. Rhodes's design—which was highly commended by the Assessor—having been selected by the client at whose suggestion the competition was instituted.

THE GARDEN HOUSE SALTWOOD NEAR HYTHE. JOHN W. RHODES, ARCHITECT.

Keystones.

Mr. James Mansergh, F.R.S., past-president of the Institution of Civil Engineers, is lying seriously ill at Lancaster.

For the Restoration of Culross Abbey a fund is being raised. Mr. Carnegie has subscribed £100.

The Loanhead Board School, Kilmarnock, has been erected at a cost of £18,000 from designs by Mr. R. S. Ingram. Accommodation is provided for 1,150 scholars.

St. Mary's Church, Newton Abbot, is now being erected at an estimated cost of about £9,000 from designs by Mr. Edmund Sedding, of Plymouth and London.

Liverpool Cathedral.—The total sum now available for the main building is £146,918, and as the architect's estimate for this portion of the work is £277,000, the sum of £130,000 still has to be raised.

King's College Architectural Society.—A series of papers will be read before the society this term, to which all students and architects are invited. The first is for to-morrow, when Mr. M. Houghton will read a paper on "Christchurch Priory" at 5 p.m.

New Ball and Assembly Rooms at Norwich have been built on All Saints' Green. The ballroom is 70ft. by 40ft. and has a floor of maple wood laid on springs. Mr. J. Owen Bond, of Norwich, was the architect and Mr. J. Holmes the contractor.

Cheltenham Schools Competition.—In the recent open competition for new schools in Keynsham Road, Cheltenham, thirty-five sets of designs were received, and out of this number the designs of Messrs. Chatters & Smithson (Cheltenham), Messrs. Healing & Overbury (Cheltenham and Gloucester) and Mr. H. E. Lavender (Walsall) were reserved for final consideration, and the plans of Messrs. Chatters & Smithson ultimately accepted.

Salt-water Baths for Salford are propose to be erected at a cost of £20,000 on a sit facing Eccles New Road. There will be first-class swimming bath 65ft. by 25ft., second-class bath 75ft. by 32ft., with six first class and twelve second-class men an women's slipper baths. Provision will b made for a storage reservoir of salt wate not less than 100ft. in length by 40ft. i width and 10ft. in depth, the holding capacit being 250,000 gallons of sea water, which i to be pumped from a steamer.

Municipal Architecture.—In reply to th R.I.B.A. memorial regarding the practic of important architectural work being carrie out by borough surveyors and engineers, th Town Hall Committee of the Mancheste City Council state:—"(1) The architectura work of the Manchester Corporation is n placed in the hands of engineers or su veyors. (2) It has been deemed desirable t the Corporation to form an architectur department under the control of the ci architect, and that department carries o such architectural work as the Corporati from time to time orders. The suggesti of the Institute 'that the official in char shall be required to have obtained the qua fication of the Royal Institute of Briti Architects' has been complied with in t case of our city architect."

The Society of British Sculptors, of which e first statutory meeting will be held on onday next, aims at establishing a National allery of British Sculptures and attaining a oyal Charter.

Prof. Henry Adams, M.I.C.E., who ecently retired from the City of London ollege, has been appointed chief examiner building construction under the Board of ducation, South Kensington.

Stroud and District Master-Builders' Assoiation.—Mr. A. W. Hook (of Messrs. Wall Hook) has been elected president for this ear, in succession to Mr. W. F. Drew, of hatford.

The Apulian Aqueduct.—On May 3rd a oncession will be offered by the Italian overnment for the building of this great queduct, the cost of which is estimated at 5,400,000. A deposit of £24,000 will be quired.

All Saints' Church, Benhilton. — Three arved oak screens have been erected in the hancel from designs by Messrs. W. Hilton ash & Lionel S. Detmar, F.R.I.B.A., of ondon. The screens were made by Messrs. arry Hems & Sons, of Exeter.

St. Mark's Campanile, Venice.—The old undations have been strengthened by 3,076 iles of larch of 13ft. average length and 8in. verage diameter, capable of supporting the eight of the new tower, which is estimated t about 16,000 tons. Down to the end of st year the cost of the work was £4,623. he total cost of strengthening the foundaons is estimated at £8,000.

A Queen Victoria Memorial School for e sons of Scottish sailors and soldiers is to e erected on the Kippendavie estate, about wo miles from Stirling. Accommodation ill be provided for 200 boys. The buildgs will be of rough-cast brick with stone ressings, and the estimated cost is £45,000. he work of constructing the building ill be commenced in the course of the mmer, and it is expected the work will ccupy eighteen months. The architect is r. John A. Campbell, of Glasgow.

Wooden Cottages and Insurance.—In the ournal of the Society of Arts a writer bserves in regard to this matter: "Take e most inflammable, all wood, thatched, nd in a row. The charge would be 7s. 6d, er cent. But thatch is no longer used for overing, and for a wooden cottage tiled e rate is 5s. per cent., provided the local uthority has approved of the heating rrangements and there is proper separation f the cottages one from the other, or there a brick wall between two carried up above e roof. The owner of the most inflammable ttage, valued at £150, can guard against ss by an insurance charge of 11s. 3d. per nnum, and in the case of the majority of ooden cottages of that value the annual harge would not exceed 7s. 6d."

The Strand Improvement. — Writing to e "Times" in regard to the proposed line f frontage between the churches in the trand, Mr. Frederic Harrison (who was hairman of the Improvements Committee of e London County Council in 1892, when e original scheme of the new street from olborn to the Strand was proposed and assed) says: "I should look on the line now id down as a fatal blot on the whole heme—an irreparable eyesore to London. o adhere to the sordid makeshift now rranged would be a wanton sacrifice of one f the finest opportunities London has ever ad. The penny-wise economy of saving oney by gaining a new building site will rove in the end self-destructive. . . . As we roposed the scheme in 1892, there were to be o buildings at all between the Crescent and he Strand. This open space would have iven one of the finest street views in Europe. his was sacrificed in order to gain a building te. . . . We also proposed, as the site for the indispensable county hall, the entire block between the new avenue and Lincoln's Inn Fields—having a noble frontage both west and east."

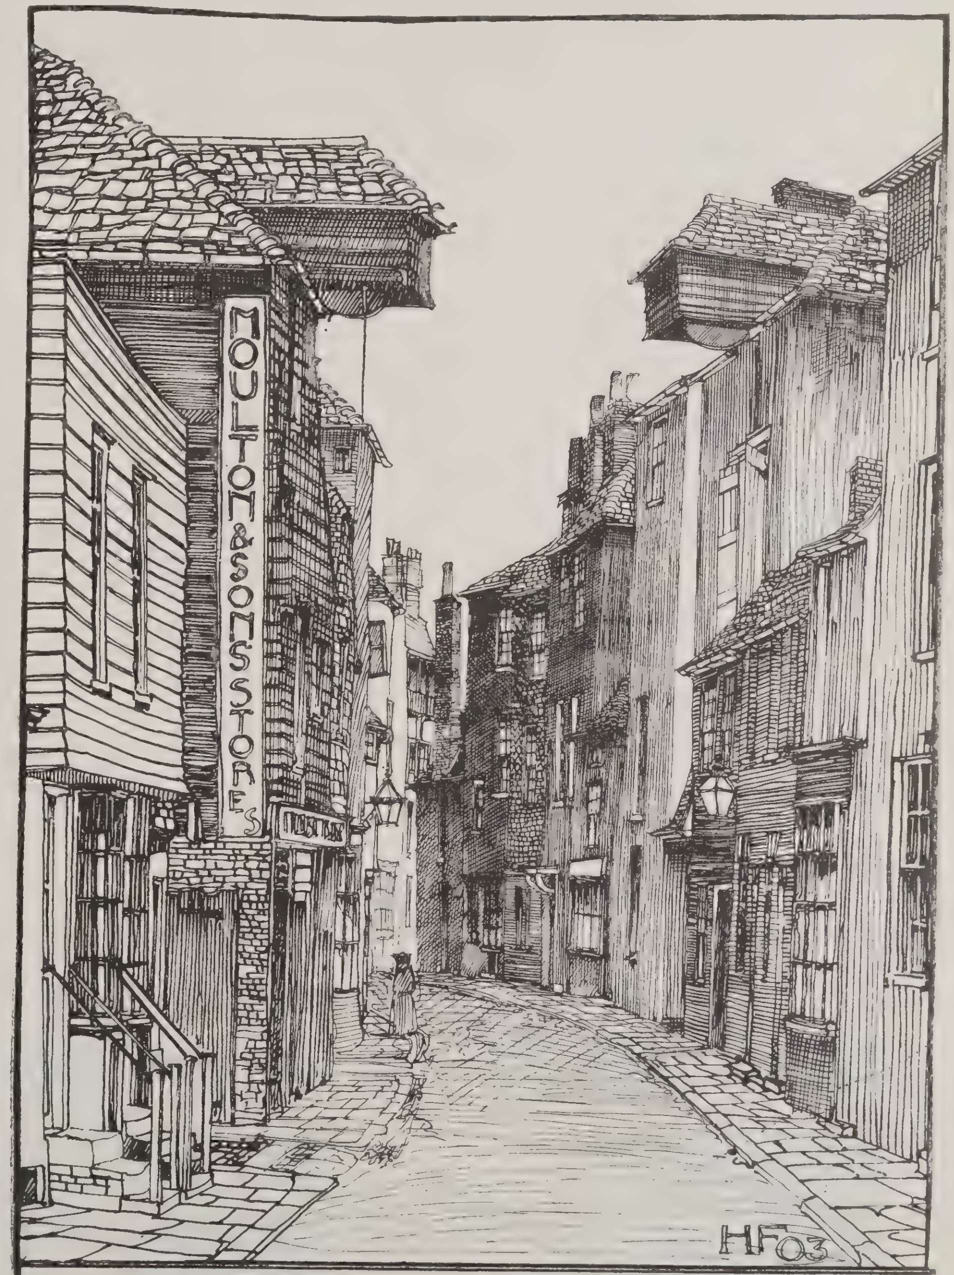
L.C.C. Fire-Stations. — Under present arrangements six new fire-stations are built in London annually and more than seventy have to be kept in repair.

A Roman Kiln has been discovered in some ancient half-timbered premises at Worcester known as King Charles's House. It is in a perfect state of preservation and is constructed entirely of ¾in. tiles and cement. It is just within the city wall, which dates back to the time of the Commonwealth; but the front of the house appears to be built upon a wall of Roman character, constructed of 2¾in. tiles and 2½in. bricks, laid alternately.

Two Houses of Historical Interest.—Commemorative tablets are to be placed by the London County Council on No. 18, Stamford Street, Southwark (the house of John Rennie, who designed London and Waterloo Bridges), and on No. 76, Charlotte Street, Fitzroy Square, W. (the house where Constable lived).

Recent Researches on the Ancient Sites of Greece and the historical geography of Western Asia, particularly Palestine, are the subjects of a course of lectures which the Liverpool Institute of Archæology has arranged to be given by Dr. Caton and the Rev. Linton Smith on successive Wednesdays.

Royal Academy Exhibition, 1905. — As already announced in our columns, the sending-in day for architectural works is Friday, March 24th, from 7 a.m. to 10 p.m. Following our practice in previous years, we shall be glad to deliver pictures at Burlington House free of charge after having made such reproductions as we desire, but we cannot undertake to receive any pictures later than 3 p.m. on the sending-in day. It would be a great convenience if architects would let us have their works in good time instead of crowding them in helter-skelter at the last moment.



STREET IN OLD HASTINGS
LOOKING·TOWARDS·FISHMARKET

DRAWN BY HAROLD FALKNER.

Complete List of Contracts Open.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDERS MAY BE OBTAINED.
	BUILDING:		
Feb. 9	Twickenham—Cottages, &c.	Council	F. W. Pearce, Town Hall, Twickenham.
„ 9	Goring-on-Thames—Gasworks Extensions	Thames Valley and Water and Gas Co.	Thames Valley and Goring Water and Gas Co., 20 Bucklersbury, E.C.
„ 9	Kirton, Lincs—Laboratory	——	J. Rowell, Church Lane, Boston.

Contracts Open.

NAAS NO. 1 RURAL DISTRICT.

NEWBRIDGE WATERWORKS.

The Council of the Naas No. 1 Rural District will, on Wednesday, the 1st March prox., consider Tenders for carrying out the above works, which comprise the Construction of a Concrete Reservoir Tank and Filters, together with the enclosing of same by a mound and ditch fence; the Sinking and Lining of Wells; the Erection of a Pump House; the providing and laying of Cast Iron Pipes; the providing and fixing of Oil Engines, Turbine, and Pumps; the providing and fixing of Street Fountains; and the providing and fixing of Sluice Valves, Fittings and other Works, in strict accordance with plans and specification prepared by the Council's Engineer, Mr. F. Bergin, B.E., Beechgrove, Kildare. The plans, etc., can be seen at my office on any day (Wednesdays and Saturdays excepted), between the hours of 10 a.m. and 2 p.m.

The several Works must be fully completed by the 1st day of September, 1905.

No Tender will be considered which is not on the Form, to had from the undersigned.

Tenders, accompanied by a Schedule of Prices, and containing the names and addresses of two solvent sureties willing to join in a bond of £600 for the due performance of the Contract, will be received by me up to 11 o'clock a.m. on the 1st proximo.

The Contractor must pay all expenses in connection with the preparation and execution of, and Stamp Duty on, Contract and Bond.

The Council do not bind themselves to accept any Tender, and the acceptance of any Tender will be provisional upon the authority of the Treasury being obtained to the loan sanctioned by the Local Government Board to defray the cost of the works.

By Order,
D. J. PURCELL,
Clerk of Council.

Council Offices, Naas,
2nd February, 1905.

TO PAINTERS and CONTRACTORS.

The Guardians of the Kingston Union invite TENDERS for PAINTING the whole of the EXTERNAL WOOD and IRONWORK to the Infirmaries and other buildings at the Workhouse, Kingston-on-Thames, also some INTERNAL PAINTING.

Persons desirous of tendering are requested to send their names and addresses to the architect, Mr. WILLIAM H. HOPE, Seymour Road, Hampton Wick, on or before WEDNESDAY, 8th proximo, when a copy of the particulars of the work will be forwarded.

The Guardians do not bind themselves to accept the lowest or any Tender.

JAMES EDGELL, Clerk.
Union Offices, Coombe Road, Kingston-on-Thames.
27th January, 1905.

THE BUILDERS' JOURNAL SUPPLY DEPARTMENT.

Following our settled policy of helping our subscribers in every way possible, we have decided to inaugurate a department for the supply of drawing office requisites of a reliable nature, and at low prices.

We have been able to make satisfactory arrangements with the best manufacturers, and we propose to publish from time to time illustrated lists of the articles supplied with prices, &c., as follows :—

No. 1 List. **Sets of Mathematical Instruments.**
No. 2 List. **Various Scales and Philotechnic Set.**
No. 3 List. **Drawing Boards, T Squares and Set Squares.**
No. 4 List. **Drawing and Tracing Paper, Tracing Cloth, &c.**
No. 5 List. **Inks, Water Colours, Paints, Brushes, &c.**

LIST 4.

DRAWING AND TRACING PAPERS, &c.

Drawing Paper (Whatman's):

Royal	5/6
Imperial, 72 lbs	9/6
" 90 lbs	15/6
" 140 lbs	22/-
Double Elephant, 140 lbs.	21/-

Drawing Paper (Arnold's):

Royal	5/6
Imperial, 72 lbs	9/6
" 90 lbs	15/6
" 140 lbs	22/-
Double Elephant, 140 lbs	21/-

Drawing Paper (Saunders & Co.'s):

Imperial, 72 lbs	5/-
" 90 lbs	7/6
" 140 lbs	9/6
Double Elephant, 140 lbs	9/6
Antiquarian, 240 lbs	40/-

A large Sample Book of Messrs. T. H. Saunders & Co.'s drawing paper will be sent free on application. Although the price is lower than other makers, we strongly recommend this paper. It is thoroughly reliable.

ALLIANCE TRACING PAPERS.

No.	Sort.		Size of Sheets.	Per quire or roll.
77	300	Thin French	30 × 20 in.	2/-
	301	Do.	30 × 40 in.	4/-
	302	Stout French	30 × 20 in.	2/5
	303	Do.	30 × 40 in.	4/9

53 BERNERS STREET
LONDON

All the material used in the Framing of these Doors is put together as shown here.

The Interior "Core" is made in strips of selected pine with the grain reversed, and dried with 200 degrees of heat.

The Exterior Hardwood Facing is welded to the Core by means of immense pressure, making in effect one solid piece

RICHLY CARVED DOORS carefully reproduced from old models can be made in any hardwood, possessing all the elegance and richness of figure and colour found in the antique examples.

ARCHITECTS are invited to inspect the specimen doors on exhibition to satisfy themselves as to the construction, quality and artistic merit. Sample doors can be seen at the Showrooms of the various agents, or at 53, Berners Street, London, W.

A GUARANTEE. The Gilmour Door Co., Ltd., will give a guarantee with all their doors that they will not warp, twist, split, shrink or crack. They are absolutely reliable.

COST. A well-made Hardwood Door can be obtained at prices varying from 35s. to £10.

CATALOGUE. A book of designs, prices, &c., will be sent on application to "Dept. B," 53, Berners Street, London.

THE
BUILDERS' JOURNAL
AND ARCHITECTURAL RECORD.

February 15, 1905. Vol. 21, No. 523. 6, Great New Street, Fetter Lane, E.C.

Summary.

In the erection of the huge new power station at Chelsea for the electrified "Underground" 8,000 tons of steel have been used and six million Fletton bricks. The work was executed in record time. Current is generated at 11,000 volts and transformed to 600 volts on the rails. (Page 84.)

The London Building Acts Amendment Bill will be opposed by the metropolitan local authorities, the property owners' association, the London Chamber of Commerce, the City Corporation and the R.I.B.A. (Page 86.)

In order that different temperatures may be maintained in different rooms the air-supply ducts are made double, the passage for warm air being placed over that for cold air and the branch ducts for each room so arranged that they can draw their supply from either or both. For filtering the air a coke screen is best. (Page 90.)

A most interesting application of reinforced concrete is afforded by the platform of the new bridge at Luxemburg. This is on the Coignet system, and consists of slabs and beams resting on the walls of the archways. The beams were prepared in advance and brought into position on a truck running on one of the walls, and they were made to support the centering for the slabs. (Page 93.)

In a case recently heard at the Liverpool County Court the question was whether a tenant was liable for dry-rot in his house because he had allowed ivy and creepers to grow over the ventilation holes of the foundation walls and had used brown paper under carpets. The jury decided he was not liable, holding that the dry-rot was due to inherent defects in the building. (Page 92.)

The First Garden City is to be called Letchworth. (Page 85.)

Mr. John Leaning died recently as the result of an operation for appendicitis. (Page 96.)

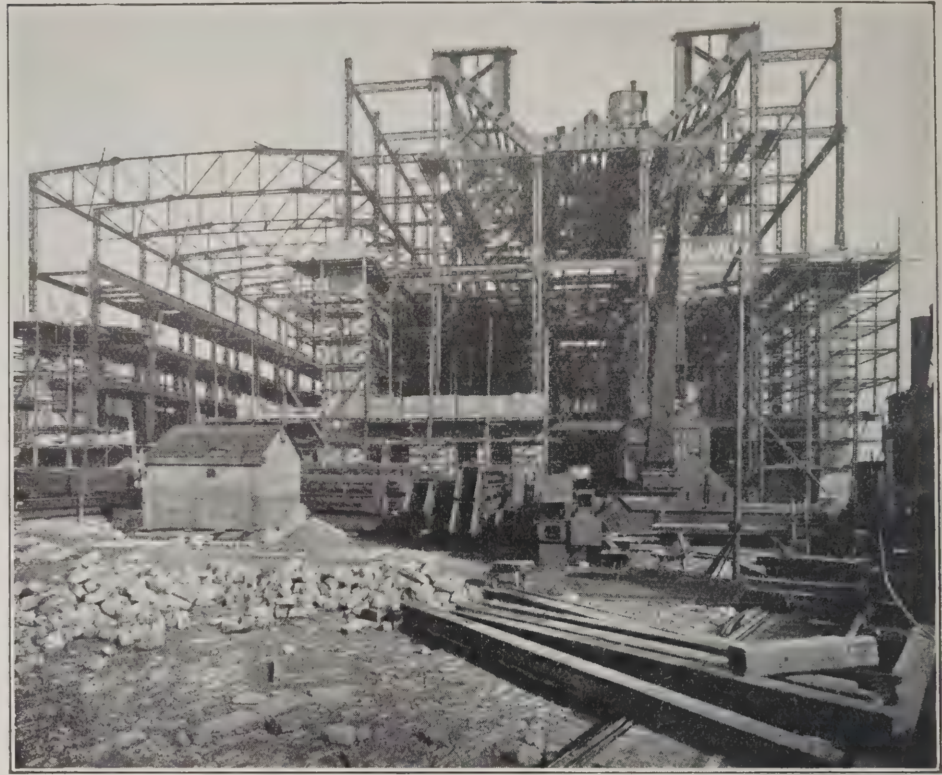
The Holborn-Strand improvement scheme will be finished by the end of this year. (Page 96.)

In a paper on church fittings read before the Architectural Association last Friday Mr. Charles Spooner said 3ft. 5ins. was the most convenient height for an altar and 2ft. 6ins. was sufficient width. The five liturgical colours of the Church of England were white, red, green, purple and black, so that five frontals were required. A rood loft was hardly necessary, as nowadays we no longer engaged strolling minstrels who had to be put where they could not get at valuables. The eagle lectern, if artistically treated and made very much unlike the real bird, might be rather nice, but the form of a single or double desk was better. As to pews, the best modern ones he had seen were designed by Mr. Norman Shaw for the church at Bedford Park. (Page 94.)

Temporary Ballrooms. The action of Mr. Lionel Phillips, of Grosvenor Square, brought in such a public-spirited manner against a firm of caterers, has reminded the public of the very grave question of requiring official control in respect of light temporary buildings of the ballroom type—so highly inflammable and so dangerous, and yet practically exempt from expert supervision. Practically every householder can erect in his back-garden, in a yard or on the leads of a back addition a structure of wood supports and canvas, fitted with electric lighting, and then invite his numerous guests to dance or sup therein, and whilst naturally relying on due care being taken by his caterers or contractors, who should be versed in the protective measures needed, may find himself in the position of having invited his friends to a death-trap through no fault of his own. Any question of door openings, window openings or the like by which the guests can reach the open are apparently unconsidered trifles from a caterer's point of view, whilst the inflammability of the materials used and the hurried manner in which the artificial illumination is arranged are in themselves sources of the greatest danger. Everything is done in a rush, and nothing is thought of the safety of the visitors. It actually came out in evidence last week that the electrical foreman was not aware that muslin would burn, and it was even stated in court by the defendants that non-inflammable materials "could not be relied upon." Greater ignorance could surely not be shown. In this specific case the temporary building was erected on the top of a back addition and was approached from the first floor and from the ground floor. This temporary structure was intended to hold about 200 people. It was constructed of the usual vertical framing, two thicknesses of canvas and art muslin, the muslin being draped over small 5-c.p. electric lights wired on a very dangerous, though no doubt pretty, flexible wire looping system. A fire broke out and was generally (and we believe rightly) attributed to an electrical cause, although the jury did not take this view; but whatever the cause, be it electrical or not, the same danger remains. It came out in evidence that non-inflammable materials were actually not used because, it was asserted, this was not customary and they were "difficult to obtain." Seeing that non-inflammable materials have been used at all our our great public gatherings, bazaars, &c., which are under the control of the London County Council ever since the end of the 'nineties, it would be well if what holds good for public gatherings were made compulsory for temporary buildings of all kinds, whether used for private or public purposes. We believe this end could be easily obtained by extending the conditions under which borough councils give licences for temporary buildings of this kind from the structural, as distinct from the fire, point of view. We propose to deal with this case at length in our next Fire Supplement, for, thanks to Mr. Lionel Phillips bringing the matter before the Courts at great expense to himself, much that calls for public attention has been brought to light. The case was exceptionally well prepared by Messrs. Braunstein & Skelton, the solicitors, and very carefully argued by Sir Edward Clark, K.C., so that it is of considerable technical value.

The Treatment of Wood. It is a surprising thing how wood is misused by the architectural profession and the building trades of this country. It is built like masonry, twisted and bent like metal, stained to an unnatural colour, painted to imitate some other material, or grained to imitate some other variety—all because its users have no sense of its own intrinsic beauty of grain, colour and surface. Why must the architect ignorant of the principles of joinery (except for the slight smattering from a text-book which can in no wise take the place of instruction by working wood oneself) insist on designing woodwork as if it were stone, gaining stability from weight, perpendicular alignment and arch form, or as if it were metal bolted and riveted with its pegs and bolts? Timber is straight in grain, is strong in tension, and the strength of a nail and of a glued joint is remarkable. The Japanese can appreciate beauty of grain and natural colouring, but we perforce must think the more expensive the most beautiful. People are not now satisfied with oak—they stain it an unnatural green or fumigate it. Our most prized mahogany furniture is American whitewood under the stain. We English ought to blush with shame at our barefaced lying in the use of graining. We know graining cheapens the work because the trouble to get a plain colour even and pure is saved, the defects not being apparent when grained, and that the life is longer because dirt, finger-marks, cracks, &c., do not show so much as on a plain surface. Yet why cannot a simple combing be used without attempting any imitation? Beautiful effects can be obtained by combing dark colours such as green and blue, and the combing may take the form of patterns.

THE "UNDERGROUND" ELECTRICITY POWER STATION AT CHELSEA.



POWER STATION IN COURSE OF ERECTION.

THE huge power station which has been built at Chelsea for the Underground Electric Railways Co. of London, Ltd., is situated on the banks of the Thames at the point where the Chelsea Creek runs into the river, one side of the building adjoining the creek and the other side facing Lot's Road.

The following particulars of the materials used will give some idea of the magnitude of the work :—

Fletton bricks - - - - -	6 millions.
Terra-cotta in string-courses, arches, cornices, &c. - - - - -	17,000 cub. ft.
Special-made arch bricks, all of different patterns - - - -	85,000
Red pressed facing bricks - -	85,000
Portland cement - - - -	600 tons.
Hydraulic lime - - - - -	260 ,,
Paint - - - - - - -	25 ,,
Steelwork in framing and structure -	6,000 ,,
Sundry steel and iron work not included in main structure - -	2,000 ,,

Brickwork commenced - - -	June, 1903.
,, finished - - - -	March, 1904.
Steelwork commenced - - -	May, 1903.
,, finished - - - -	December, 1904.

The building is 454ft. long by 175ft. wide, and the height to the ridge of the boiler-house roof is 145ft. The huge chimneys, 275ft. high (see centre plate), form a landmark visible all over London and for miles around. The building is of the steel-frame type, the entire weight of the structure and the internal fittings being carried by the steelwork, the brickwork simply forming the casing. The contract for the superstructure was placed with Messrs. Mayoh & Haley, who have had special experience in the erection of steelwork and who have recently opened a splendidly-appointed modern steelworks in Townmead Road, Fulham. In placing the order for the work, time was one of the essentials of the contract, and the completion of the station in twelve months forms a record in building undertakings in this country.

The steelwork framing was erected by means of Scotch derrick cranes with 90ft. jibs, carried on bogeys travelling the whole length of the building. Of these there were employed during the construction two 7-ton and four 5-ton steam derricks, besides two 3-ton, two 2-ton and several smaller hand derricks. These were fed with material by steam loco cranes, and were raised from floor to floor as the framing grew. The boiler-house roof was fixed by means of two 3-ton Scotch derrick cranes carried on a travelling gantry fixed on the top of the coal bunkers 120ft. from the ground. The bricklayers and terra-cotta fixers were served by four double electric cage hoists fixed at various points of the building. There were also four steam winches for hoisting sundry materials, and the mortar mills were driven by electric motors. The riveting of the steelwork in position was done by pneumatic hammers, and wherever work of any kind could be done better or more rapidly by machinery the best modern power appliances were used in preference to hand labour.

A large staff of highly-trained engineers and draughtsmen was maintained by the contractors to accurately set out and supervize the erection of the superstructure, and when it is considered that they had to check and revise the enormous number of detail drawings required by the manufacturers for the various special bricks, terra-cotta blocks, casements, rainwater pipes, &c., as well as the plumbers, glaziers, bricklayers and carpenters employed, it will be seen that their task was an onerous and responsible one. The work was exceptionally difficult owing to the great heights at which parts of it had to be carried out, and the fact that provision had to be made for a number of separate contracts to be carried out at the same time without interfering with each other in order that the whole building might be completed within the wonderfully short period of twelve months. It was no small undertaking to so organize the supplies to a huge contract like this that everything should be delivered at the time it was required; and as a large proportion of the special materials had to be manufactured in a shorter time than English makers had ever been accustomed to consider possible, the difficulties in this respect were very great.

SITE PLAN.

They were however eventually overcome, and the completed building is a monument of high-class work carried out by English energy and industry.

Messrs. Mayoh & Haley have also built, entirely, several of the sub-stations which are situated at intervals along the system of the underground railways, in which the high-tension current supplied from the main station at Lot's Road is transformed to a lower voltage before being fed into the conducting rails: and the Fulham Steel Works Co., Ltd., have furnished the steelwork for a number of these sub-stations.

The maintenance of the rolling stock of this important system of railways will entail extensive work for repairs and renewals, and there has already been constructed at Mill Hill Park a huge carshed for this purpose covering an area of 17,000 sq. ft., exclusive of the extensive sorting yard, with its elaborate network of points and crossings on which the cars coming from the sheds can be made up into trains and those coming in for repairs or examination can be sorted and run into any one of the three bays of which the shed consists. The sheds are 800ft. long and comprise a repairing shop 70ft. wide by 27ft. 6ins. high to the wall-plate, with electric travelling cranes spanning its width and running the whole length of the carshed and paint shop, each 70ft. wide and 18ft. high to the wall-plate.

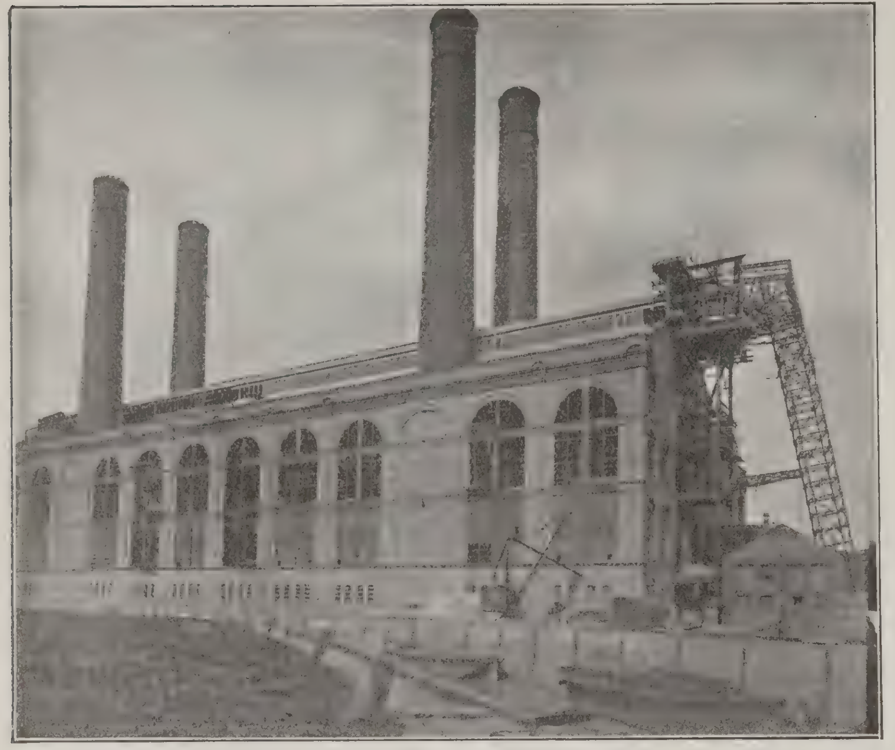
The whole of the steelwork for these sheds, also erected by Messrs. Mayoh & Haley and manufactured at the Fulham Steel Works, comprises more than 1,000 tons in the roof principals and stanchions alone, exclusive of a large quantity of miscellaneous work included in the lantern lights for roofs, offices, stores, &c. joists for supporting shafting, and a system of overhead runways for serving the various machines, as well as the whole of the points and crossings for the yard. The roof consists of forty-nine framed steel principals in each bay, with steel joist purlins supported on latticed stanchions, and covered with galvanized corrugated sheeting and glass. The steelwork was delivered on the site in sections, sorted, assembled, riveted together and stacked in position for the steam cranes which were to convey it into place, and it was erected by means of two steam derrick cranes travelling on bogeys the length of the building as the work proceeded. The whole erection was completed in July, 1904.

Electric trains have been running upon the Baker Street and Uxbridge extension of the Metropolitan Railway since January 1st, and it is hoped that the whole system will be in use this summer. It should be explained that the Chelsea station, here illustrated, will supply the current for the "District" railway and for the various "tubes" which are being constructed by the Underground Electric Railways Co. of London, Ltd., while power for the "Metropolitan" system will be supplied from the new station at Neasden.

The electrical capacity of the Chelsea station is stated to be 57,000 kilowatts at normal load. There are four powerful exciter-sets or dynamos and eight main-generating sets. The latter are three-phase alternators, built to generate 11,000 volts across each phase, and are driven by horizontal turbines running at a thousand revolutions per minute. There are sixty-four boilers two storeys high, arranged in groups of eight, each group being designed to supply the steam for one main-generating set. The water-supply is ample, and a siding of the West London Railway is close at hand so that truck coal can be easily manipulated. All the machinery for handling the coal is worked by electricity. The high-tension cables are carried in sixty-four ducts to a point on the Metropolitan District Railway at Earl's Court, where they separate for the sub-stations. The whole of this feeder system is in duplicate, as a protection against breakdown. Both at Chelsea and Neasden the turbine generators have been built by the British Westinghouse Electric and Manufacturing Co., Ltd. At the sub-stations the current is reduced by static transformers from 11,000 to about 440 volts and converted to continuous current at about 600 volts, at which it is conveyed to the conductor rails.

PROGRESS MADE WITH THE FIRST GARDEN CITY.

THE annual meeting of shareholders in the First Garden City (which is being erected between Hitchin and Baldock) was held last Thursday. In the report, which covered the whole eighteen months of the company's existence, it was stated that the total outlay on the estate was about £20,000, in addition to £9,177 repaid to mortgagees and other persons. Thirty-six houses, representing a capital value of £12,000, were built or being built, and arrangements had been made to spend £20,000 more in similar work. The company itself, however, was not erecting houses. The waterworks, including the pumping station and reservoir, were now in operation, and about five miles of mains had been



GENERAL VIEW OF POWER STATION, LOT'S ROAD, CHELSEA.

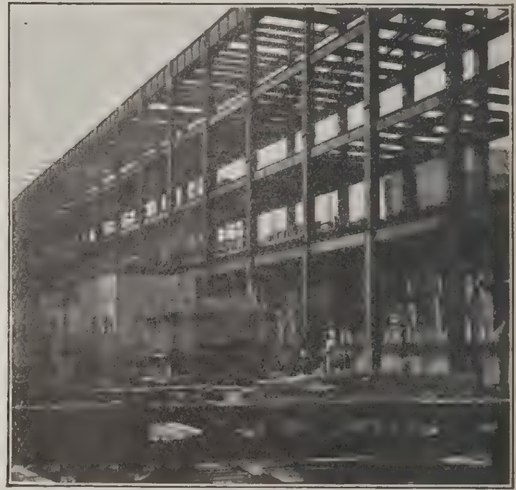
laid. About two miles of sewerage had been constructed from Letchworth along the Baldock and North Roads, and from the station to the factory sites. The directors were convinced of the desirability of both gas and electricity, but had decided to begin with gas, the works to produce which would probably be ready by June 30th. More than three miles of road had been or were being made, throwing 300 acres open to building. A siding for goods wagons had been constructed and was already being extended. The passenger station in the middle of the estate had been used only occasionally, but arrangements were being made with the Great Northern Railway Co. to open it for regular traffic in April, and plans for additional station buildings were being prepared. Five firms of manufacturers had agreed to take land, and applications had been received from others. The question of providing further educational facilities was under consideration, and steps were being taken to erect a public hall. An exhibition of cheap cottages would be held on the estate from July to September. In compliance with the wishes of the great majority of shareholders, the First Garden City would henceforth be called Letchworth.

With regard to the exhibition of cheap cottages it may be stated that up to the present sites for about forty cottages have been definitely applied for, and many more intentions to build have been expressed. It is intended to offer prizes not only for the best £150 cottage, but also for the best plans and designs of suitable houses, as well as novel building materials, and such fittings as kitchen ranges, baths, coppers, &c. Any inventor will also be able to erect cottages on the non-permanent site in the exhibition, and arrangements have been made for the financing - up to 90 per cent. of the cost—of buildings erected on the permanent site, the plans of which must, however, be first approved by the First Garden City (Ltd.).

L.B.A. AMENDMENT BILL.

Further Opposition.

At a conference of delegates from twenty - two metropolitan local authorities held last week at the Westminster Palace Hotel, the following resolutions were passed: (1) "That the provisions of the London Building Acts Amendment Bill are of such a drastic and complex character, and if passed into law would be found so unintelligible and unworkable, that it is desirable that the Bill should be withdrawn or opposed." (2) "That, inasmuch as the London Building Act of 1894 is already complicated by the amendments of the Act of 1898, this conference is of opinion that a new Building Act for London, codifying the present law, should be formulated, and that before the Bill is drafted the views of the London County Council, the Corporation of the City of London, the councils of the City of Westminster and the several metropolitan boroughs, and the various professional associations connected with building work, should be ascertained and considered, and that, in the opinion of this meeting, a Royal Commission should be appointed to take evidence accordingly and to report on the whole question, with a view to the drafting of a Bill codifying and amending the London Building Acts." (3) "That in any new measure the London County Council should be relieved as much as possible by transferring to the City and borough councils of all duties that can be efficiently discharged by those bodies in accordance with the views expressed by the Royal Commission in 1894."—On Wednesday last the Incorporated Association for the Protection of Property Owners resolved "that the Bill should be opposed at every stage in Parliament," and on Friday the council of the London Chamber of Commerce decided to lodge a petition against the Bill. The Royal Institute of British Architects also protest against the general form and conditions of the Bill.—The articles on the Bill which appeared in the "City Press" (148 and 149, Aldersgate Street, E.C.) have been re-issued in pamphlet form, price 2d.



CONDITION OF WORK, SEPTEMBER 16TH, 1903.

INTERIOR OF ENGINE HOUSE, SHOWING TURBO-GENERATORS.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Factory and Workshop Inspectors.

WESTFIELD.—W. N. G. writes: "Please give some particulars in regard to the appointment of inspectors under the Factory and Workshop Acts. Are any examinations held?"

It is necessary to obtain a nomination from the Home Secretary through the local M.P. or some other source. An examination has then to be passed when a vacancy occurs, the following being the subjects:—(1) English composition, (2) arithmetic, (3) sanitary science as applied to factories and workshops, (4) law relating to factories and workshops, (5) elementary physics and mechanics, (6) history of industrial and social legislation in the United Kingdom, (7) chemistry, (8) mechanism. Supposing the syllabus to be unaltered, the following books might be studied:—(1) Nesfield's "Manual of English Grammar and Composition" (2s. 6d.); (2) any good elementary arithmetic; (3) Maxwell's "Warming and Ventilation" (2s.); (4) Maxwell's "Drainage and Sanitary Fittings" (1s.); (5) Reid's "Practical Sanitation" (6s.); (6) First "Department Report on Ventilation of Factories and Workshops" (1s. 8d.); (7) Austin's "Law relating to Factories and Workshops" (7s. 6d.); (8) Williams and Musgrave's "Factory and Workshop Act, 1901" (3s. 6d. nett); (9) Taylor's "Theoretical Mechanics, including Hydrostatics and Pneumatics" (2s. 6d.); (10) Henderson's "Elementary Physics" (2s. 6d.); and if chemistry be the special subject selected, (11) Roscoe and Lunt's "Inorganic Chemistry for Beginners" (2s. 6d.), followed by (12) Roscoe and Hannen's "Inorganic Chemistry Advanced" (4s. 6d.); or if mechanism be the special subject, (13) Low's "Introduction to Machine Drawing and Design" (2s. 6d.), (14) Unwin's "Elements of Machine Design" (Part I. 7s. 6d., Part II. 6s.), or other textbooks recommended by the class teacher. This course ought to occupy twelve months' close study, unless you have already made some advance in the various subjects. The examination would probably be held in London. HENRY ADAMS.

[The books named above can be obtained post free from our offices at the prices given.]

Drain or Sewer.

LEYTON.—MATERIAL DIFFERENCE writes: "The plans at the town hall show a drain which is part of a combined system to run within 1ft. of the right-hand side of a house (within the metropolis), whereas as actually laid the drain runs within a foot of the left-hand side—a difference of about 13ft. or 14ft. As the town hall plan is clearly wrong, does it not make the drain a sewer within the meaning of the Act? Could it be reasonably maintained that it makes no material difference, seeing that to reconstruct the drain it is necessary, as the drain is actually laid, to excavate about 30ft. additional under the kitchen and scullery; whereas if it had been laid as ordered by the plans of the town hall it would have been laid outside these rooms and would merely have gone under the flooring of the back and front parlours?"

We do not understand what you mean by the "town hall plan"; is this a plan deposited for approval, or a plan prepared for the borough engineer for his own information and use. Further, what do you mean by combined system? Is this house one of several discharging sewage into a common drain; or by "combined" do you mean that the sewage and rainwater from the house both discharge into a common drain? The inaccuracy of any plan prepared by the borough engineer would not affect the question.

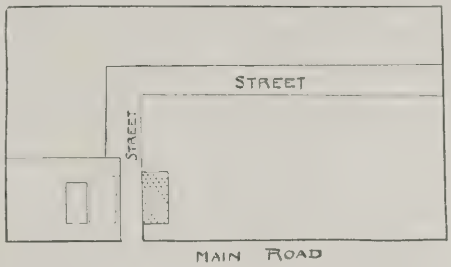
Cost of Schools.

WREXHAM.—SCHOLASTIC writes: "What is a reasonable price per ft. cube for ordinary one-storey central hall elementary schools?"

About 8d. per ft. cube would be a reasonable figure.

New Streets.

LEICESTER.—H. A. writes: "At one corner of a large field is a house of which I have been the owner for twenty years. The ground was bought out of the field about 100 years ago. Lately the owners of the field sold it to a man who made a street in front of my house and is selling the land for building purposes. Opposite my house a man has built a house and only left about 13ft. for the street. I now desire to build another house in front of my old one, but the council will not pass the plans because the new street is not wide enough. They do not want to purchase the ground from me to complete the street. They are just trying to bustle me out of it. What action should I take?"



There seems to have been some sharp practice, and you should have taken action before. But you cannot be prevented from building on this plot provided you make your house and the entrance to it face the main road. Your case is analogous to that of *St. George's Local Board* v. *Ballard*, decided in the Court of Appeal on February 26th, 1895. There was a passage about 176ft. long and 8ft. wide running out of a main road having on one side a row of cottages and on the other side gardens belonging to the cottages. Defendant, Ballard, purchased these gardens and began to build thereon three houses fronting not on the passage but on the main road. The wall of the end house next the passage extended about 40ft. up the passage, and the wall of its garden extended 40ft. further. The local board contended that defendant was laying-out the passage as a new street and could be compelled to widen it to the extent required by the by-laws. Judgment was given for the defendant on the ground that what defendant had done did not amount to laying-out or constructing a new street. The appeal of the local board against this decision was dismissed on the ground that *there was no evidence of any intention to build houses fronting the passage.* You will have to take proceedings to compel the council to pass the plans, or challenge them to take proceedings by commencing to build the house. On this you should take legal advice.

NORTHAMPTON.—ROAD writes: "(1) Can A and B (being owners of land approached from an occupation road 18ft. to 24ft. wide, and being partly responsible for keeping it in repair) prevent C from forming a new street 36ft. wide out of the occupation road? (2) Can C give purchasers of plots adjoining the new street right of access, both foot and cart, over the occupation road (there is at present a public footpath over same), and if so, would any liability rest on the purchasers as to the repair of the occupation road? (3) Can the local council object to the proposed new road owing to the width of the occupation road (which is the only approach to the new road)? (4) Can the local council refuse to take over the road when properly formed owing to the absence of access to it (the occupation road not being a public road repairable by the local authority)?"

(1) They can prevent vehicular traffic; the footpath still remains. A and B cannot prevent C constructing a new road on his own land. (2) Doubtful whether more than the footpath rights exist. (3) Yes; but it depends on the by-laws in force. (4) Yes.

Sanitary Examinations.

LIVERPOOL.—T. E. M. writes: "Which is the more valuable, the examination of the Royal Sanitary Institute or that of the Institute of Sanitary Engineers? Does the latter's certificate cover the M.S.I. certificate of the former, or *vice versa*? Does the certificate of inspector of nuisances of the R.S.I. cover the certificate of the Institute of Sanitary Engineers?"

The two institutions are entirely separate and distinct, and their examinations and certificates have no bearing on one another. The Royal Sanitary Institute was founded in 1876 and incorporated in 1888. It is now under Royal patronage, and is the better-known of the two institutions. The Institute of Sanitary Engineers was incorporated in 1895. We cannot decide for you in the matter. It would be best for you to write to the secretaries of both asking for particulars, so that you can judge which you would care to take up.

Road Surveyor in Partnership with Contractor.

CLEETHORPES.—G. C. writes: "I send a report of an examination wherein it is stated that a debtor had undertaken road-making for the urban district council of Cleethorpes in partnership with the council's surveyor. Can the latter enter into partnership with a road contractor and at the same time supervize the work of the contractor? What steps should I take as a ratepayer to bring the matter before the proper authority in the event of the local authority taking no action?"

It is very undesirable for a road surveyor to enter into partnership with a road contractor whose work he must control and supervize. Whether it is illegal is another question; it depends on the terms of the surveyor's agreement with the local authority. In the event of the council refusing to take action your course would be write to the secretary of the Local Government Board, Whitehall, London, S.W., stating fully and clearly all the circumstances, and sending documentary and other evidence if possible. If several other ratepayers joined you in signing this statement it would add weight. But you must be very sure of your facts.

Alterations or Erasions in Printed Forms of Contract.

ILLINGWORTH.—ANXIOUS writes: "In using printed or lithographed forms of contract, conditions and specifications, having portions erased, altered or scored out, is it necessary where these occur to have the same signed or initialled by the architect, contractor and employer? In 'Specification' No. 6, p. 195, clause 4 simply states in supplementary provisions to form of conditions: 'the contractor to examine the contents of these specifications, the printed portion as well as the written, as every word printed is to remain in full force unless it is erased or scored out by the architect or owner, before signing.' If not initialled, &c., who is to know by whose authority the same has been altered, and might not the omission invalidate the contract in the event of its coming before a judge?"

Yes, the alterations should be initialled by the contractor.

Stone used in Lancashire.

London.—H. A. C. writes: "What stones are used for facing work in and about Burnley, Lancashire?"

Appleton, Bolton Wood, Bramley Fall, Calverley Wood, Howley Park, Idle, New Leeds, Park Spring, Scott Hall, Spinkwell and Cliffwood are all within easy distance.

Architectural Drawing.

Brentford.—E. W. T. writes: "In Mr. Maurice B. Adams's' article on 'Drawing for Architects' in 'Specification' No. 7 I notice he recommends the student to obtain William Burges's folio of 'Architectural Drawings' and any volume of the London Architectural Association Sketch-Book. Can you give me any particulars of these, where they can be obtained and the price?"

For Burges's folio apply to Mr. B. T. Batsford, 94, High Holborn, W.C. The Architectural Association Sketch-Book can be obtained at the Association's offices, 18, Tufton Street, Westminster. The work is issued to subscribers only, the subscription being one guinea per volume.

Contracts.

Halifax.—T. S. writes: "If an employer asks for a contract to be lent to him and the architect objects (as holding same between employer and contractor), should the employer insist? Is the architect bound to lend it, or should the employer or the contractor demand a copy? Is the architect obliged to let either of them have a copy?—in which case, can the architect make a charge for same, and what would be a fair amount?"

The architect should keep the contract and provide copies, for which a charge can be made.

Timber Prices.

Dover.—W. H. G. writes: "Where can timber be obtained from time to time at the rates published in your columns?"

The timber prices given in our columns are—as the title above them indicates—"current market prices": that is to say, the prices of large quantities sold by auction at the docks. Naturally, for small quantities the prices will be higher.

Insufficiently Cooled Cement.

Hull.—A. G. writes: "Supposing that in order to save time it was found imperative to use insufficiently cooled cement (in the construction of an ordinary fireproof floor) what precautions would you adopt to obviate any possible defects?"

Mix with an excess of water and leave a space around the walls for expansion; but it is very risky to use "hot" cement.

Thickness of Walls.

Harringay.—H. writes: "The by-laws of an urban district council stipulate that walls of given length and height (less than three storeys) must be 14ins. thick at the base and 9ins. for the top storey. A house is designed with ground and first floors, and in the roof, above the wall-plate, a servant's bedroom and box-room. The local surveyor says this constitutes a storey, making three in all, and insists on walls being 14ins. everywhere. Is he right? If so, it is useless for the topmost storey to be 9ins. thick, as there is no brickwork."

In our opinion 14ins. for the ground storey and 9ins. above is quite sufficient for a three-storey house, but the surveyor is entitled to insist upon the extra thickness prescribed by the by-laws.

Ballroom on First Floor.

Newcross. — Candidate writes: "Please answer the following question, set at a recent examination: 'A ballroom 32ft. by 80ft. has to be constructed on the first floor, the ground floor being a solid heavy-brick structure without internal or cross walls or other supports. The room is to be constructed entirely of wood—floor, sides and roof; the roof to be open and unceiled, and the timbers of the sides may be shown inside as well as out. Draw $\frac{1}{2}$ transverse section and $\frac{1}{2}$ plan of one bay.'"

We cannot undertake to answer examination questions such as this. On more than one occasion we have stated that our Enquiry columns are not intended for such questions, but for matters arising in everyday work.

Measuring on Hill Face.

Berwick.—Dispute writes: "In fencing a piece of ground a part of it is on a very steep hill face. A dispute has arisen between the parties as to the proper mode of measuring this sloping portion. Should it be measured on the slope or on the horizontal?"

In all cases of measurement of land for the purpose of placing its dimensions upon a plan, and when buying and selling, &c., the horizontal measurements are employed, and a reference to any book on surveying will give you the reasons for this in detail. The only case in which the surface (sloping) measurements are taken is where labour (for instance, reaping, hoeing, &c.) is paid for.

F. S. I.

Assignment of Contract.

Gloucester.—J. F. T. writes: "In the contract form issued by the R.I.B.A. clause 19 reads as follows: 'The contractor shall not without the written consent of the architect assign this agreement or sublet any portion of the work.' What weight has this clause in the event of a builder failing or, assigning his estate to a trustee for the benefit of his creditors? Or, in the event of the builder assigning the contract to a particular creditor without the architect's consent, can the assignment be ignored by the architect?"

There is no doubt that the assignment by the contractor to a particular creditor constitutes a breach of clause 19 of the R.I.B.A. conditions, but I am of opinion that an assignment to the trustee in bankruptcy does not constitute such a breach. It is even doubtful whether forfeiture of contract can be enforced in case of the contractor's bankruptcy, although a special clause to that effect has been inserted in the contract. The trustee in bankruptcy has the right under section 55 of the Bankruptcy Act, 1883, to disclaim any unprofitable contract, but this does not necessarily prevent the employer from proceeding under clause 26 of the R.I.B.A. conditions.

F. S. I.

Strength of Concrete Steel Lintel.

Referring to the reply and enquiry under this head on p. 79 of our issue for last week, Mr. James A. Smyth (Cambridge) writes: "'Studio' is unconsciously playing with fire. He should know that the methods of calculation in concrete steel cannot be supplied *ad libitum*: even if they were, some knowledge of the subject would be needed before the formulæ could be used with perfect safety. Assuming that the actual load he mentions is really 11 tons, I find from mere inspection of the tables that at least an 18in. deep beam is required if the beams are 12ins. wide with about 2 square inches of steel reinforcement in the bottom; even then investigation should be made for shear on cross-sectional area of the beam against supports. The latest experiments carried out on beams of reinforced concrete have resulted in locating the neutral axis about $\frac{4}{10}$ths of the distance from the top of the beam to the centre of the steel for 1 per cent. of steel of high elastic limit, approximately only, on account of its varying position when under increments of loading. This position with other data enables the student following the subject closely to devise a formula in connection with the ascertained results. With regard to compression, 500 lbs. is an ordinary value assumed by many constructors. The subject will be found to be exceedingly complex to the ordinary person; and if he really wishes to study it fully, let him begin with Major Winn's 'Notes on Steel Concrete.'"

[*Note.*—In the reply given in our issue for last week, line 3, for "estimate" read "concrete."]

Gallery Cantilever.

We have received the following criticisms of Professor Adams's reply to the enquiry on the above subject published on p. 79 of our issue for last week:—

J. B.—"The solution given does not appear convincing. One might suggest a simpler solution, thus:—Taking moments about the column, and remembering that the distance is 11ft. between the centre of column and the centre of bearing on wall,

6 tons × 10ft. = 4 tons × 5ft. + w tons, the weight of wall × 11ft.

3 636 tons = w, which is the weight of wall to counterbalance the upward pull of the cantilever.

The weight on the column is
= 6 + 4 + 3·636
= 13·636 tons."

K. P.—"I was asked the same question some six months ago, but obtained a slightly different result. The only point doubtful with me is the horizontal portion and the weight of 4 tons. Professor Adams apparently assumes part of this weight of 4 tons to be carried by the wall and part by the column, thus making the moment due to this load acting around the column cap as a fulcrum, zero. But should not the whole of the 4 tons be considered as acting in the opposite direction to the 6 tons, since the 6 tons, being the larger (but for the anchorage), would draw it upwards, thus relieving the wall of all weight? I arrived at the following result, taking the point above the column as fulcrum:—

Moment of projecting portion = 10 × 6 = 60ft. tons.
Moment of horizontal portion in opposite direction 4 × 5 = 20ft. „
Difference = moment to be obtained by anchorage = 40ft. „

Taking the point of anchorage as 11ft. distant, the anchorage would be $\frac{40}{11}$ = 4 tons nearly. Therefore the weight on the column = 6 + 4 + 4 = 14 tons.

I offer this solution with all diffidence, as somehow or other I feel Professor Adams may prove himself correct."

[Professor Adams will doubtless reply in our next issue.—Ed. B. J.]

Duplicating Quantities.

Timperley.—Mahogany writes: "Is there on the market any appliance to take copies (4 to 6) of ordinary quantities as supplied to builders which are usually lithographed or typewritten?"

Duplicates could be taken on "blue prints" if the original were written on thin paper, or they could be taken by one of the several duplicating processes. Full particulars of the former will be found in our issue for August 31st last and of the latter on p. 354 of the issue for July 29th, 1903.

THE TIMBER TRADE.

London Market in January.

THE first month's consumption of wood in London was disappointing, showing a shrinkage of 2,800 standards in comparison with the small deliveries of January, 1904. A glance at the figures will show the stock to be a light one, but really ample to meet the reduced demand upon it. A large and active business was concluded during the month for arrival next spring and early summer. Both Swedish and Russian shippers have sold freely, and buyers have operated (especially in Russian stocks) with a confidence which is rather at variance with the complaints of bad trade and poor consumption which are heard on all sides. In the opinion of Messrs. Churchill & Sim the reasons for buyers' action are twofold, namely, the moderate prices at which good specifications can be secured, and a confidence that the general trade of the country is likely to improve in the near future, which is bound by degrees to affect the consumption of wood. The present activity seems, therefore, to be the outcome of anticipation of the future rather than a reflection of present conditions, and the progress of consumption will need very careful watching in forming an estimate of the probable course of the market. Freights remain cheap, with plenty of tonnage offering.

Messrs. Denny, Mott & Dickson state that the new year opened with a general feeling that the cost of material could not go lower, and there has been a well-defined movement to enter into large forward contracts for soft woods at the low level of prices ruling at the end of last year. Prices for forward supplies have, therefore, distinctly hardened; but the demand for consumption has shown little reliable indication of expansion. The present floating tonnage is very ample, even though the volume of trade shows a distinct improvement on that of last year.

The abstract of stock, consumption, &c., for January, published by Messrs. Foy, Morgan & Co., is given in the table at the foot of this page.

Dock Stocks in January.

The stock of wood in the public docks of London on January 31st was as follows:—

	Pieces.
Foreign deals and ends - - -	1,916,000
Do. battens - - - -	2,929,000
Pine deals and battens - - -	1,222,000
Spruce do. do. - - -	1,220,000
Boards, rough - - - -	4,200,000
do. prepared - - -	8,179,000

Totalling 19,666,000 pieces, as compared with 23,125,000 in 1904, 20,321,000 in 1903 and 20,876,000 in 1902.

In other kinds the stock was as follows:—

Foreign wainscot logs - -	434 pieces.
Do oak timber - - -	855 loads.
Do. fir timber - - -	1,212 do.
Colonial oak timber - - -	1,510 do.
Do. birch timber and planks -	2,461 do.
Do. elm and ash timber -	938 do.
Do. yellow pine - - -	517 do.
Do. red pine - - -	243 do.
United States pitch-pine timber -	21,228 do.
Do. do. deals -	55,000 pieces.
East India teak - - -	7,670 loads.

The Deliveries for January

have been of—

	Pieces.
Foreign deals and ends - - -	287,000
Do. battens - - - -	451,000
Pine deals and battens - - -	85,000
Spruce do. do. - - -	105,000
Boards, rough - - - -	562,000
do. prepared - - -	1,086,000

Totalling 2,576,000 pieces, as compared with 2,774,000 in 1904, 3,316,000 in 1903 and 3,303,000 in 1902, or in cubical contents:—

	Jan. 1905.	Jan. 1904.	Jan. 1903.	Jan. 1902.
	P.s.h.	P.s.h.	P.s.h.	P.s.h.
Sawn wood -	11,276	12,557	14,285	16,130
Prepared boards	3,482	3,912	4,756	4,670
	Loads.	Loads.	Loads.	Loads.
Timber - -	5,194	6,356	5,100	8,389

Deliveries to Craft.

Deliveries direct from ship to craft were—

	Jan. 1905.	Jan. 1904.	Jan. 1903.	Jan. 1902.
	P.s.h.	P.s.h.	P.s.h.	P.s.h.
Deals and battens -	1,634	2,632	1,930	2,363
Boards - -	394	402	679	580

Soft Woods.

Messrs. Churchill & Sim state that the Swedish market has been an unprofitable one, and prices were barely maintained in January except for parcels of battens and scantlings landed in good condition under cover, for which, whenever a demand showed itself, rather more remunerative prices were obtainable. Prepared boards showed distinct weakness on the whole, in spite of the short stock, but a moderate improvement of the demand is all that is wanted to put them back to the autumn level of prices, and possibly a shade beyond it.

The importation of floorings from Norway has only been a normal one, but in consequence of reduced requirements prices have fallen during the month. The stock is not by any means excessive, and any fair improvement in the demand would soon bring them up a point or two.

Russian deals have commanded profitable prices to importers, and the stock of parcels of reliable quality is not at all excessive. The free-on-board market has been active, and many stocks are practically cleared for f.o.w. delivery. Any attempt, however, to raise values has been met by importers with indifference owing to the poor consumption in this country, and to the fact that the demand will have to improve considerably if they are to come into the market again later.

A little hardening of the prices obtainable here for Finnish battens and scantlings is just perceptible. A large business has been concluded for delivery ahead at moderate prices which have tempted buyers to operate. The stock is not excessive, especially in scantling sizes.

There was no importation of Prussian timber into London in January. Prices for delivery have reached such a high level that the timber has been replaced as a regular market wood by sawn pitch-pine timber, and the importation of it is almost exclusively for special works and railway contracts.

January brought with it no improvement in the demand for Canadian pine deals, of which the stock in London is quite a full one. A quantity of first pine was sold at auction during the month at prices quite out of keeping with high rates current on the other side, but the quality of some parcels left much to be desired. Spruce deals showed here and there some little improvement towards the end of the month, but the opportunities for easily acquiring cheap stock from New Brunswick at short notice have militated against any hardening in the value of regular third- and fourth-quality deals. The only importation during the month was a fair quantity from that district, which met with a good demand on account of the very low prices at which it could be secured. The stock of sawn timber from the pitch-pine ports was added to by one cargo during the month, but the consumption does not improve. The only hope for a more active market is the fact that prices ahead have stiffened very considerably, and that this improvement is the result of a genuine home demand in the States, and the large and apparently increasing requirements of other countries outside Europe. Deals are selling at better prices owing to the increased cost of replacing them.

Hardwoods.

Teak.—Messrs. Denny, Mott & Dickson report that the landings in the London docks during January consisted of a total of 356 loads, as against 883 loads for January, 1904. The deliveries into consumption were 1,255 and 790 loads respectively. Figures show a continuous falling off in supplies and the consequent inconvenient shrinkage of stocks, which are not only very unduly small but of a specification too poor to satisfactorily meet the requirements of consumers. Prices continue to rise in consequence, and business is of a necessarily restricted character, as even high prices cannot increase the volume of supply if the cry of *non possemus* is genuine, as the state of shipments seem to prove it to be.

Mahogany.—Messrs. Denny, Mott & Dickson state that the market has been very quiet, but prices have well held their own, as in face of the modest imports the demand has been adequate, if not brisk. Messrs. C. Leary & Co. report that they had two public auctions during the last fortnight of January, at both of which the results were satisfactory.

Odessa Oak.—The enquiries for forward supplies continue to be encouraging; but in view of the possible interruption to business which may be caused by the political turmoil in Russia, shippers are careful in committing themselves to fresh business. Stocks on this side are all but exhausted, and the available supplies ready for shipment are already sold.

American Oak.—The demand for quartered is weak and prices are low; Messrs. Leary quote from 2s. 6d. to 4s. 9d. per cub. ft. The arrivals of plain planks are moderate and prices firmer; there is a regular business in first-quality boards, with a small enquiry for medium grade: values range from 1s. 3d. to 2s. 9d. per cub. ft.

American Whitewood.—The tone for lumber is rather dull, the chief enquiry being for first and medium qualities; quotations are 2s. 3d. to 3s. 6d. per cub. ft. for first quality, 1s. 9d. to 2s. for clear saps, 1s. 6d. to 1s. 9d. for medium, 1s. to 1s. 3d. for culls.

Italian Walnut.—The stocks, which were already more than sufficient, have been further increased; only prime planks, wide and thick, are likely to yield satisfactory results; for such quotations are 6d. to 7½d. per ft.

VENTILATION.—II.

The Advantages and Limits of "Natural" and "Mechanical" Systems Compared.

By J. D. SUTCLIFFE.

(Concluded from p. 78, No. 522.)

In many buildings it is necessary to have different rooms at different temperatures. A room where heavy manual work is being done requires a much lower temperature than, say, a drawing office. Fig. 9 shows a method by which this can be easily accomplished. Each main air-supply duct is made double, the passage for warm air being placed over that for cold air, and the branch ducts for each room are so arranged that they can draw their supply of air from either or both ducts at pleasure. The fresh air is brought into the building from the outside. It passes through the filter screen to the fan, which forces it forward through the air-warmer and warm-air duct, or through the cold-air duct, according to the valves that are open. If the room is required very warm the regulating valve is dropped and all the air-supply comes from the warm-air duct. If it is required to be cold, the valve is raised and the air enters the room at the normal temperature, or even lower in summer time. It will also be readily seen that the valve can be fixed in any intermediate position and the air can be drawn equally from both ducts or mixed until the desired temperature is obtained. This system would be very useful in many factories, as the air could be conditioned to any required degree.

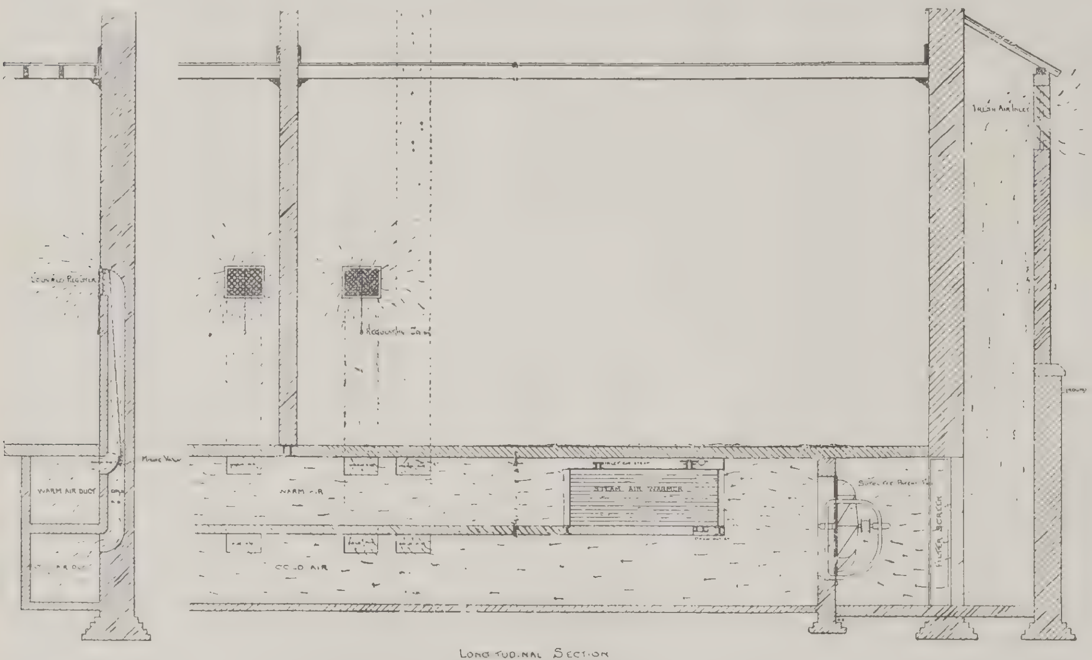

FIG. 9.—SHEWING METHOD OF CONTROLLING TEMPERATURE.

Theatres and Similar Public Buildings.

Theatres and public buildings have frequently no windows in the auditorium; they are surrounded by corridors and other rooms; they have several tiers or galleries; and no system of ventilation but the plenum is of any use. In the balconies and circles of theatres the cubic space allowed to each person is so limited that unless a large quantity of air is positively forced into them they become foul in a very short time. There are many theatres where the height between the floor and ceiling of the circles is less than 7ft., whilst the space from back to back of the seats is barely 2ft. 6ins. and each seat only occupies 1ft. 6ins. in width. This practically means that each person is in a cubicle containing only 27 cub. ft., and it requires no stretch of the imagination to see how rapidly the air in such a small space becomes impure. Another difficulty is that the "pittites" are fully dressed and often wearing their overcoats, whilst the occupants of the stalls on the same level are very scantily clothed. It therefore follows that what is a comfortable temperature for one is a disagreeable one for the other, and the stalls may always with advantage be 5 or 6 degs. higher in temperature than the pit proper.

My own idea of ventilating a theatre is to have an underground main air-duct, say, 6ft. high and 3ft. 6ins. wide, all round the auditorium wall. Into this duct fresh air should be forced by means of a fan or fans, and then five or six vertical air-ducts led from it to each of the various tiers. In this way the air will be distributed to all parts of the auditorium. The arrangement is shown fairly well in Fig. 10. The plan indicates the positions of fans, fresh-air supplies, screens, &c. The pit and stalls are best ventilated by small platforms or risers running under several rows of seats right across the theatre. Under the small platforms should be pipes for heating, so that the incoming air may be warmed to a suitable temperature. The main air-duct and the small platforms under seats are shown to a larger section in Fig. 11. This section shows how the temperature and air-supply are controlled by an attendant in the main air-duct. If he wishes to partially or wholly shut off the air-supply he adjusts the horizontal sliding door. If warmer air is wanted he pulls forward the door above the heating battery and all the air passes through the battery; if cooler air, he pushes back the door as far as necessary. A very simple form of indicating thermometer fixed in the main air-duct shows the attendant what is the temperature in every part of the theatre.

For the extraction of the vitiated air there is nothing better than a large sunburner, but these are being gradually superseded by electroliers. Now an electrolier is practically useless as an extractor and it is necessary to supplement it with an exhaust fan of sufficient power.

The entrances and stage need only be warmed by radiators. They do not require any special ventilating arrangements. Low-pressure steam is the only satisfactory heating medium, as hot water does not answer readily enough in either heating or cooling to the demands that have to be met.

Technical Schools, Free Libraries, &c.

In schools of more than one storey, and especially where there is a central hall surrounded by classrooms, no other system than the plenum is likely to give satisfactory results. The details of the system must be worked out to suit the building, and it may be either on the lines indicated for theatres, &c., or, if there are many different rooms that require to be kept at varying temperatures, the double duct system, as illustrated in Fig. 9, may be used.

Factory Ventilation.

In the time at my disposal I cannot do more than barely

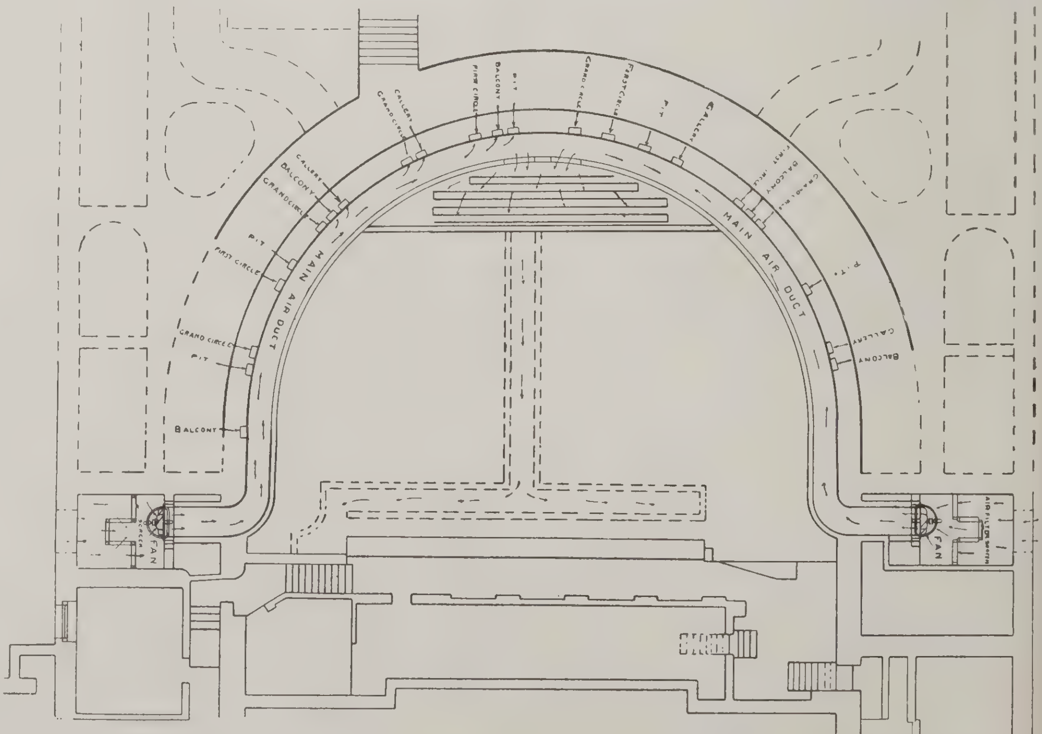

FIG. 10.—PLAN OF THEATRE, SHOWING FANS AND AIR DUCTS.

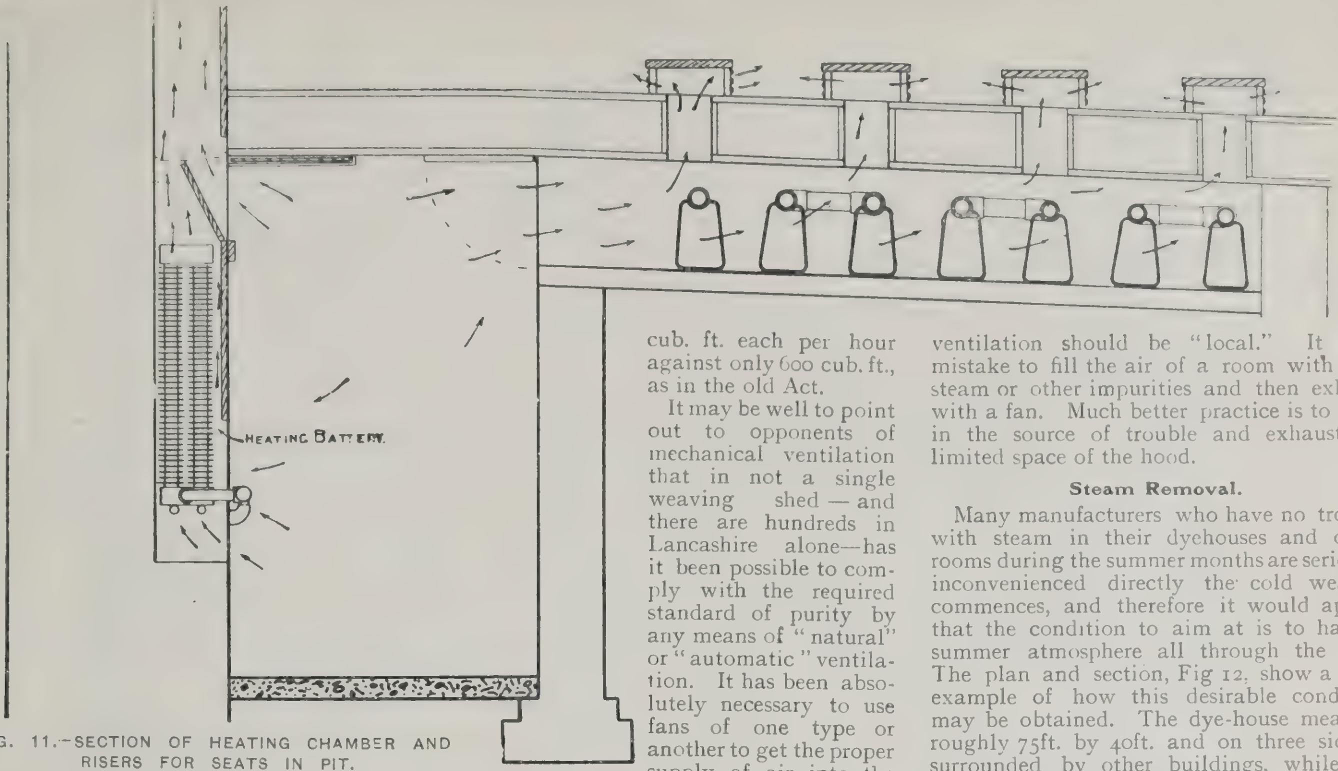

FIG. 11.—SECTION OF HEATING CHAMBER AND RISERS FOR SEATS IN PIT.

suggest a way of dealing with the various rooms or processes in a factory.

Weaving Sheds.

In the first Cotton Cloth Factories Act, controlling steaming in weaving sheds, no test of the purity of the air was imposed, but each worker was to be provided with "not less than 600 cub. ft. of fresh air per hour." This brought fans into general use in all sheds where artificial humidity was introduced, and the improvement in the health of the workpeople was most marked. The usual method was to fix 14in. or 18in. fans exhausting from the shed and to provide fresh-air inlets round the walls where possible.

In the most recent Cotton Cloth Factories Act the standard of purity of the air is fixed, and as stated previously if this standard is to be maintained at least 2,000 cub. ft. of air per hour must be supplied for each worker. By experience it has been found that to fix fans for exhausting only is not sufficient. If success is to be assured it is necessary in addition to arrange fans "blowing in." Of course, it is very different supplying 2,000 cub. ft. each per hour against only 600 cub. ft., as in the old Act.

It may be well to point out to opponents of mechanical ventilation that in not a single weaving shed — and there are hundreds in Lancashire alone—has it been possible to comply with the required standard of purity by any means of "natural" or "automatic" ventilation. It has been absolutely necessary to use fans of one type or another to get the proper supply of air into the sheds, and the tests which I referred to earlier prove that there is no difficulty in keeping within the law with mechanical ventilation.

Ventilation of Factory W.C.'s.

It is always a serious matter to fix a fan exhausting from any room to which closets are directly connected, as the foul air from the closets is certain to be drawn into the room, and this is more noticeable when the wind is blowing in at the closets. If there is a series, one above the other, it is a good plan to fix an exhaust fan on the ceiling at the top and connect all of them by means of a wooden tube. The foul air should be extracted at the level of the closet seat and the fresh air admitted by cutting 3ins. from the bottom of each door. By adopting this plan you ventilate each room into the closet, which is much better than ventilating the closets into the rooms.

Dust-removal.

"General" ventilation in factories is certainly a benefit, but where dust, fumes or especially foul air are to be removed the ventilation should be "local." It is a mistake to fill the air of a room with dust, steam or other impurities and then exhaust with a fan. Much better practice is to hood in the source of trouble and exhaust the limited space of the hood.

Steam Removal.

Many manufacturers who have no trouble with steam in their dyehouses and other rooms during the summer months are seriously inconvenienced directly the cold weather commences, and therefore it would appear that the condition to aim at is to have a summer atmosphere all through the year. The plan and section, Fig 12, show a good example of how this desirable condition may be obtained. The dye-house measures roughly 75ft. by 40ft. and on three sides is surrounded by other buildings, while the roof has a louvred outlet running almost the whole length. The steam was so dense during the winter months that it was impossible to see "your hand before you." To close up the louvres and fix a large fan exhausting the steam would only have intensified the trouble, as cold would have been pulled into the warmer air of the dye-house and would have increased the condensation without removing the steam. Instead of following such a plan, three 24in. fans were fixed in the positions shown, and as they all obtained warm air the results were extremely satisfactory. The warmth absorbed the steam, and now the place is clear in winter as in summer, and instead of a wet and dripping dye-house dust may be seen on the roof beams.

In some dye, bleach works and washhouses it is not easy or possible to get suitable warm air from any adjoining room, and recourse should then be had to a steam-heating battery for warming the air.

Basements and Cafes

are another class of room that can frequently be better dealt with by using fans than by any automatic or natural means. I wish to call your attention to the plan of a basement café shown in Fig. 13 (next page). It will be noticed that this basement has only one outside wall, and fresh air cannot be obtained at any other point. How could one hope to ventilate such a room by natural means?—as not only is it impossible to get fresh air in around the sides, but it is impossible to go through the ceiling for outlet ventilation. The actual café is 70ft. by 30ft. wide by 11ft. 3ins. high, and a 24in. fan is

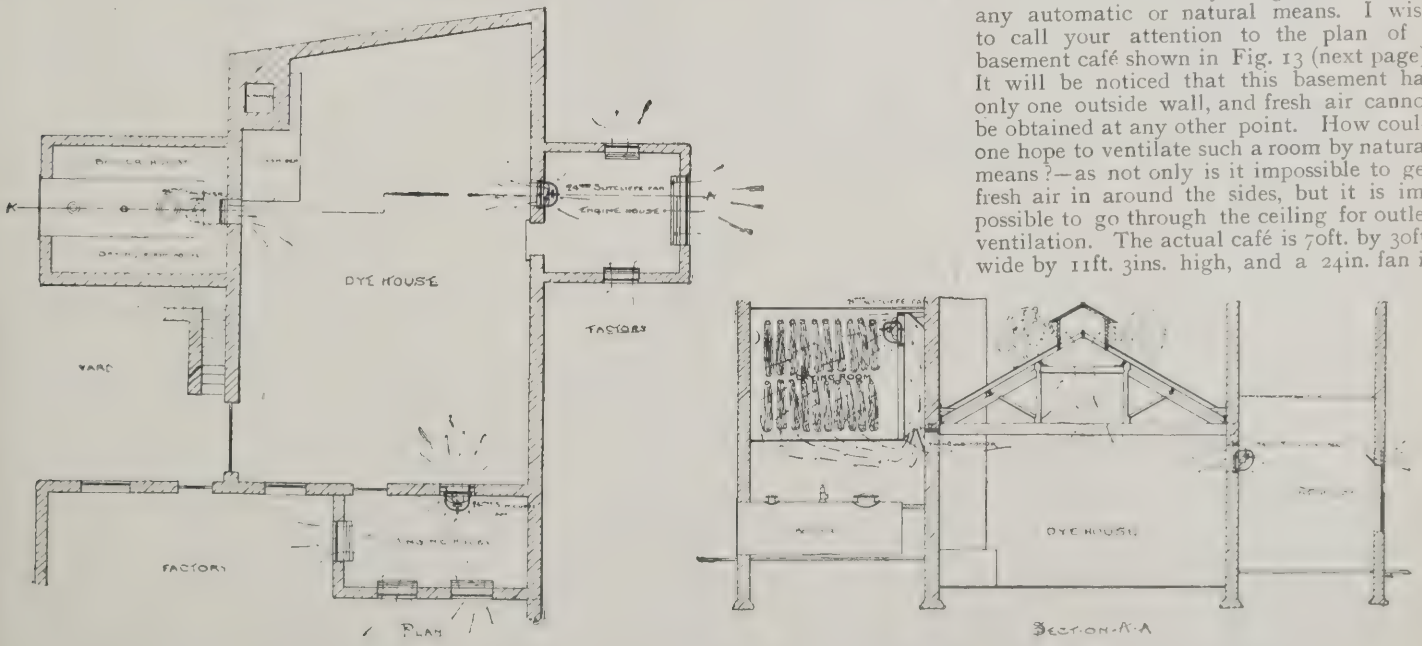

FIG. 12.—PLAN AND SECTION OF DYE-HOUSE &C. SHOWING FANS FOR INTRODUCING WARM AIR TO ABSORB STEAM.

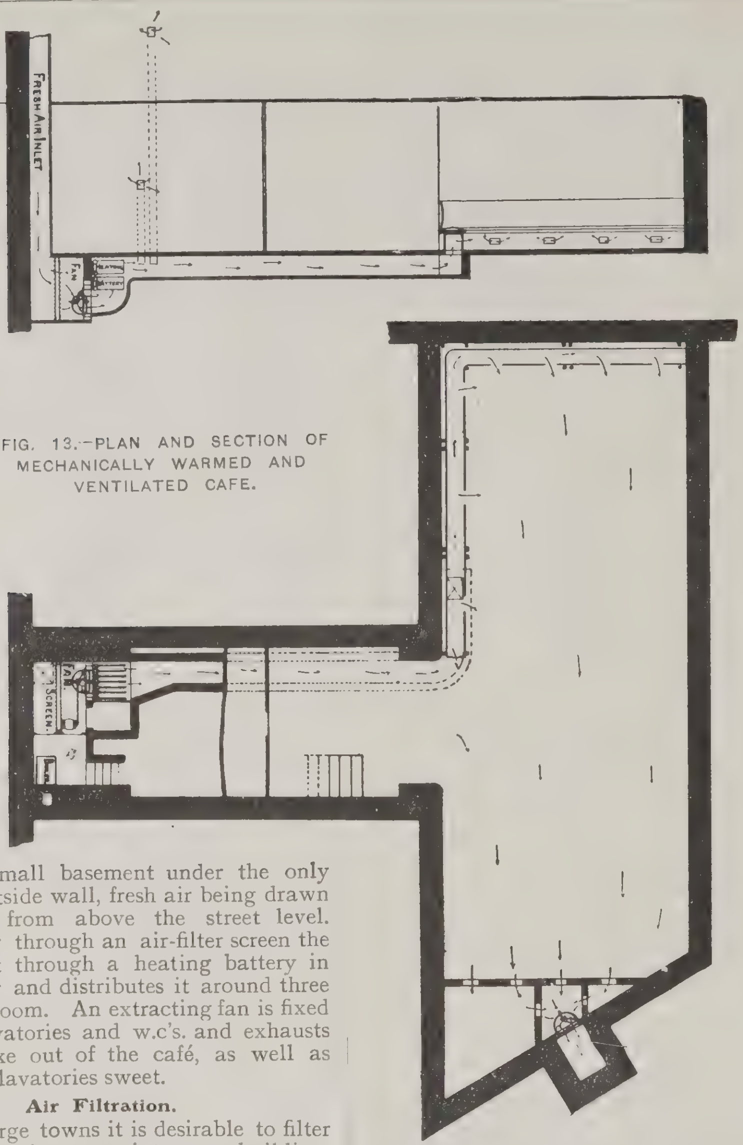

FIG. 13.—PLAN AND SECTION OF MECHANICALLY WARMED AND VENTILATED CAFE.

fixed in a small basement under the only length of outside wall, fresh air being drawn downwards from above the street level. After passing through an air-filter screen the fan forces it through a heating battery in cold weather and distributes it around three sides of the room. An extracting fan is fixed over the lavatories and w.c's. and exhausts all the smoke out of the café, as well as keeping the lavatories sweet.

Air Filtration.

In most large towns it is desirable to filter the air before it passes into any building, but this is not easy to do unless fans are used to compel the air to pass through the filter. Thin layers of cotton wool have been tried in Tobin tubes, but even a thickness of ½in. across the tube will reduce the air supply by 90 per cent., and frequently stop it altogether. Fine wire or perforated zinc over an inlet will lessen the velocity by 50 per cent. or more, and, in fact, any kind of screen or filter will stop the supply of air to a greater or less extent unless mechanical means are adopted. Many experiments have been made with cotton and jute cloths, matting, &c., but none of these seem to approach in efficiency the coke screen seen in the illustration, Fig. 14. Two frames of strong wire netting are securely attached to a wooden support about 5ins. thick. The netting should be of about ¾in. mesh and made from wire of 16's to 18's gauge. On the side furthest away from the fan a door is constructed at the top for filling with coke and a door at the bottom for emptying. The screen should have a superficial area at least equal to six times the area of the fan used. The coke, before it is placed in the screen, should be carefully washed and passed through a 1½in. mesh, as the best size for the coke is about 2ins. diameter.

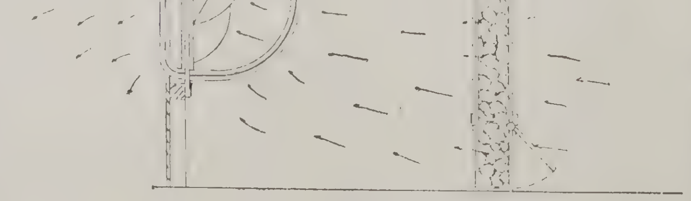

FIG. 14.—FAN AND COKE AIR FILTER.

For cooling in summer water can be sprayed against the screen and it can be washed down at any time with a hose pipe without disturbing the coke. All smuts and dust will be filtered out of the air, and even fog is very sensibly reduced by passing through the screen.

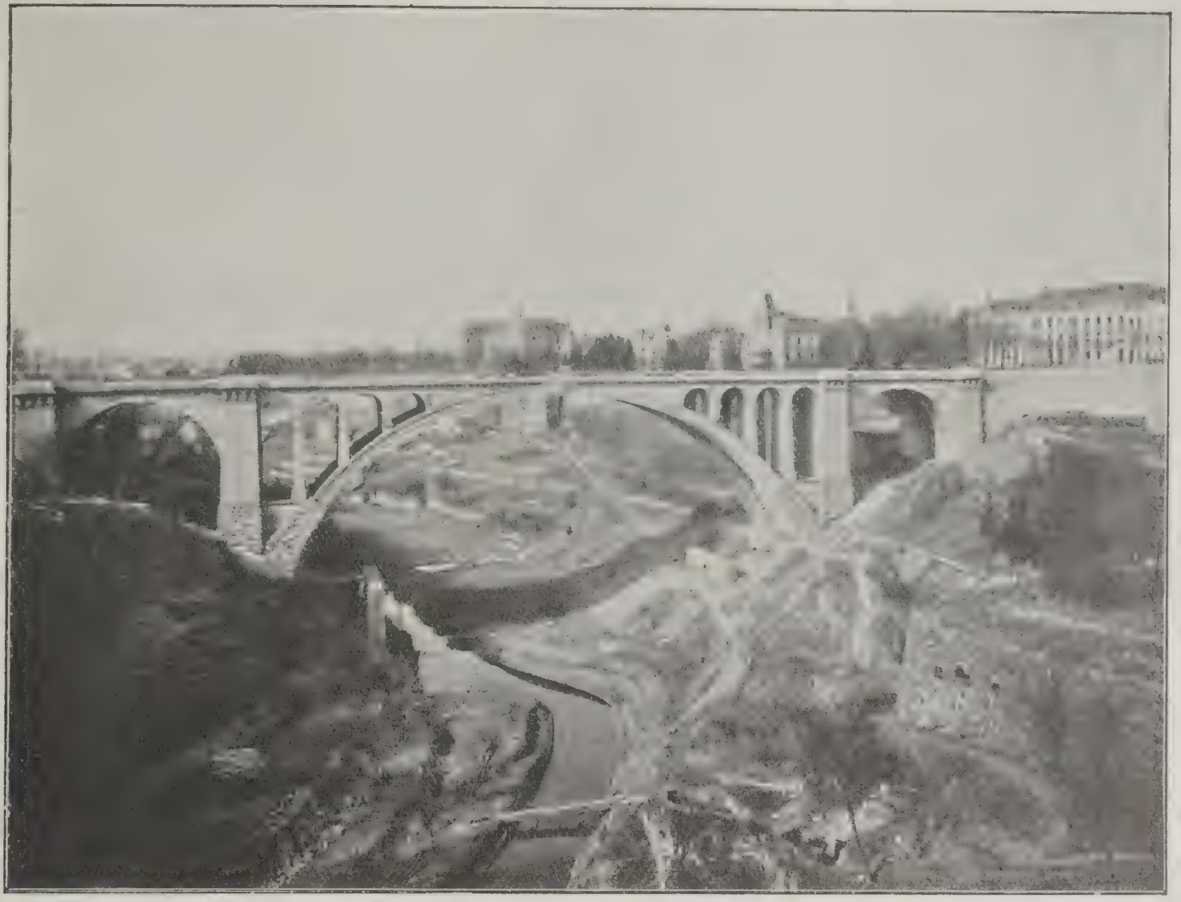
Law Cases.

Tenancy of a House and Dry-rot.—At the Liverpool County Court recently a stationer named Jones sued his tenant, a banker, living at 10, Cheltenham Avenue, Liverpool, for £77 17s. 6d. for breach of an agreement as to the tenancy of the house, and alternatively for the cost of repairs to the house he was called upon to do, which he alleged should have been done by the defendant under the agreement. The plaintiff's case was that the defendant in 1902 took a three years' lease of the house, under which he agreed to keep it in repair. The rental was £48 a year, which was a reduced amount, having regard to the nature of the agreement to repair. At the end of the second year the local health authorities required repairs to be done, and as the defendant disputed that they were such as came under his agreement he (plaintiff) had been obliged to carry them out, at a cost altogether of £77 17s. 6d. The plaintiff alleged that these were mainly occasioned by dry-rot, caused by the defendant allowing ivy and other creepers to grow over and close the ventilation holes over the foundation walls and by his having used brown paper under the carpets in some of the rooms, which had retarded the circulation of air. The defence was that the dry-rot was due to inherent defects in the building, for which defendant in law was not responsible. The jury took that view and found for the defendant with costs.

[Our expert "F. S. I." observes in regard to this case that he recently gave advice in our columns exactly opposite to this decision, which he considers contrary to "law," though it may be good "justice."—Ed. B.J.]

Lift Wells.—The case of *Cowtan & Sons* (*Ltd.*) v. *Waygood & Co.* (*Ltd.*) came before the King's Bench Division of the High Court of Justice last week. The plaintiffs, a firm of London builders and contractors, claimed against the defendants—lift makers—an indemnity against liability in respect of compensation paid by them to a painter named Jobelmann under the Workmen's Compensation Act, 1897, by virtue of an award by the judge of the Westminster Court, together with costs. It appeared that in October, 1903, the plaintiffs were doing constructional work and repairs at No. 12, Grosvenor Square, where also the defendants were constructing a lift, the structural work for which had been done by a third firm of contractors. The plaintiffs' case was that the defendants had control of the well in which the lift was to run, and that as a consequence of their neglecting to sufficiently guard the entrances to it Jobelmann fell down the well and sustained serious injuries. The jury found that, though the defendants had possession and control of the well, they had not been guilty of negligence. Mr. Justice Ridley therefore gave judgment in their favour.

Buildings Wrongly Licensed by Borough Council.—After several lengthy hearings, Mr. Lane, K.C., the magistrate sitting at the West London Police Court, recently gave judgment in regard to a summons taken by the London County Council against the Fulham Football and Athletic Club, Ltd., for retaining a temporary building on their ground without obtaining the approval and licence of the Council, as required under sections 82 and 83 of the London Building Act. The building (erected in August, 1903) afforded seating accommodation for 1,000 people in tiers varying from 3ft. to 30ft. above ground, and comprised also in the lower portion dressing-rooms, bathrooms and lavatories for the players, also refreshment-rooms, store-rooms, &c. The various rooms were lighted and warmed by gas, and a proper system of drainage, &c., was provided. Except as to the materials and method of construction, the building had more the character of a permanent structure than a temporary one. It was constructed with wood framing braced in places with iron rods and straps, covered and enclosed externally below the tiers of seating with corrugated iron, and was also roofed with corrugated iron. The contractors, Messrs. Robert Iles, Ltd., of Fulham, erected the building under a licence granted by the Fulham Borough



BRIDGE AT LUXEMBURG.

Council for a temporary wooden structure or one year on the condition that the strucure was to be erected to the satisfaction of he borough engineer and surveyor, which icence was renewed in September, 1904, for one year. After hearing the evidence and he arguments of counsel, the magistrate decided that the building was a composite tructure made of wood and iron, and thereore was within the jurisdiction of the London County Council, requiring their approval nder section 82 of the London Building Act, 1894. The magistrate further made a demolition order that the building should be completely removed within five months *i.e.*, the end of the present season), and imposed a nominal fine of 10s., each side to pay its own costs.

Interesting to Trade Unions.—In the Court f Appeal on Friday judgment was given in he case of *Airey* v. *Weighill and Others.* This was brought by Weighill and two other rustees of the Operative Stonemasons' Society and another defendant named Elliott, who was he local secretary of the Sunderland branch f the Union, against a verdict and judgment hat had been entered against them and ertain other defendants, who did not appeal, at the trial which took place before Mr. ustice Grantham and a special jury at Newastle-upon-Tyne. The facts were, shortly, hat the plaintiff, a stonemason, had for ome years been a member of the Union, but on becoming a foreman he resigned his membership and joined the Foremen's Society. Trade became bad and he went back to work as a mason, obtaining employment with a master named Shafto, who carried on business at Sunderland. The men declined o work with him unless he again joined heir Union, and as he refused to do so they ent in notice to Mr. Shafto that they would not continue working for him. The master thereupon dismissed the plaintiff, who brought this action against the defendants, with the result that the jury awarded him £8, and judgment for that amount was entered, with costs, by the learned judge. Hence the present appeal. — The Court allowed the appeal and gave judgment for the defendants, with costs.

A REINFORCED CONCRETE BRIDGE.

A MOST interesting application of reinforced concrete is afforded by the platform of the new bridge at Luxemburg (between Rhenish Prussia and France), which has one of the largest stone arches in the world, the span being about 250ft. The construction was conducted by M. Séjourné, Director-in-Chief of the Bridges and Roads Department. The platform of the bridge is supported by two twin arches about 16ft. thick, leaving an open space of about 18ft. between them. These arches were erected one after the other, the scaffolding and centering being simply shifted when the first arch was completed in order to support the second one. This method proved very economical in saving a considerable amount of scaffolding. The stonework was erected by Messrs. Fougerolle Brothers, contractors, of Paris.

Various kinds of reinforced concrete platforms were put before M. Séjourné by all the best-known specialists in France and Germany. In the end M. Edmond Coignet, a well-known Paris contractor, was chosen for the work, his system offering considerable advantages over all others. The platform supporting the roadway was made of slabs and beams resting upon the parallel walls of the archways. The beams were prepared in advance and brought into position on a small railway truck running on one of the walls, and they were made to support the centering for the slabs. This method, patented many years ago, has been frequently employed by M. Coignet and has always given very satisfactory results, both in economy and rapidity. The section below shows the method by which the centering is supported in the Coignet system. There are 72 beams, spaced every 6ft., the ends resting on the walls. The beams are 20ft. long, 16ins. wide and 19ins. high. The reinforcement consists of four bars of 1¾ins. diameter in the lower part of the beam, working to extension, and four bars of about 1in. diameter in the upper part, working to compression, both sets of bars being linked together by ties of ¼in. diameter. The slabs resting on the beams are 7ins. thick and reinforced with ¾in. extension bars and ½in. compression bars. The supporting load was that of a 20-ton roller. It may be interesting to mention that owing to the development of reinforced concrete in this country M. Coignet has thought it advisable to open a branch in London, and Mr. G. C. Workman, C.E., of 43, Chancery Lane, has been appointed agent.

SUPPORTING CENTERING FOR SLABS.

THE ARCHITECTURAL ASSOCIATION.

Mr. Spooner on Church Fittings.

A MEETING of the Architectural Association was held on Friday at 18, Tufton Street, Westminster, the chair being occupied by the president, Mr. Guy Dawber, F.R.I.B.A. Messrs. J. M. H. Watson, C. E. Lovell, R. C. Coulson, N. Jewson, T. D. Dixon, J. Filtness and A. A. Fillary were elected members of the Association. It was announced that Mr. James Lemon and Mr. A. S. Millar had rejoined.

A vote of condolence with the widow and relatives of the late Mr. John Leaning was passed.

The president stated that, for various reasons, the smoking concert arranged for March 6th would not be held.

A vote of thanks was passed to Mr. W. G. B. Lewis for the trouble he had taken—almost a year's work—in arranging and supervizing the hanging of the collection of casts in the museum.

Mr. Charles Spooner then read a paper on "Church Fittings"—under which title he included the furniture and ornaments of a church and such decoration as was connected therewith. After referring to the "high" and "low" phases of religious worship, Mr. Spooner went on to enumerate the "ornaments rubrick" of the Church of England, observing that some — such as crescents for lights and the chafing ball—had become useless, while others seemed to be outside their subject: in this connection he cited Mr. Micklethwaite's authoritative tract issued by the Alcuin Club.

The Altar.

The most important thing in the church was the altar, the best ways of treating which were the two that had centuries of precedence, namely, to place it on a raised platform reached by a flight of steps, and then, if possible, to put a canopy over it or, at any rate, to provide some rich background. Altars in England had been mostly of stone or marble, but latterly some chancellors of dioceses had objected to them being such, which Mr. Spooner thought was regrettable and curious considering the words of the rubrick. It was important that the altar should be of sufficient size. No considerations of utility need limit the length, but anything shorter than 5ft. was likely to prove inconvenient. Utility would regulate both the height and the width. During the whole of the celebration the priest *stood* at the altar, which, therefore, should be high enough to avoid the priest stooping unduly. Although men varied considerably in height, it had been found by experience that 3ins. was the limit of variety in the height of an altar. Anything lower than 3ft. 3ins. was most inconvenient for a tall man, and 3ft. 6ins. was as high as a short man could possibly use. Mr. Spooner said he had made some altars 3ft. 6ins. high, and the clergy who used them said that height was convenient; but this was the extreme limit; perhaps 3ft. 5ins. was the most convenient height for an altar. It was important not to make it too wide. The corporal (*i.e.*, the altar cloth) was usually about 20ins. square, and a little more width than that was needed; 2ft. was as narrow as an altar should be; 2ft. 3ins. was better. Unless the altar shelf (when it was intended to have one) stood on the altar, 2ft. 6ins. would be found to be wide enough for any altar. Altars should be quite simple in design, with no elaborate mouldings or carvings in high relief. It was essential for the edge of the top to be almost square; the angles should be just softened; and, if it was desired to enrich it with mouldings, they should be sunk into the flat edge; on no account should they turn over on to the top of the slab. Unless the top of the altar was perfectly flat and smooth right out to the extreme edge, there was a risk of the sacramental vessels being upset and there was also a danger of irregular projections or points catching in the vestments of the celebrant. The top or slab should be thick and heavy. A slab of stone (or, better still, marble) carried on five pillars was perhaps the best general form; or if wood were used, then it should be framed together with five or more legs braced at the bottom, and have a thick top framed with flush panels so that it might not split or warp. He had made wooden altars with framed fronts, ends and backs; but he did not think that was the best way, and consequently recommended the form of a heavy table as being altogether better.

What he had said about altars applied to all, whether a high altar or side altars, with one exception, namely, the minimum length of 5ft. was not enough for a high altar—*i.e.*, an altar which might be used for a high celebration: the minimum length in this case should be 8ft., as the celebrant, the deacon and the sub-deacon stood side by side in certain parts of the service, and anything shorter than 8ft. looked undignified. In churches where there was only one altar it was better to make it the high altar, and a length of 8ft. would not be found excessive even in the smallest churches.

Altar Steps.

A high altar should always stand raised upon a platform, three steps above the level of the sanctuary floor, and not more than three. (These three steps were required for the celebrant, the deacon and the sub-deacon, or, as they were sometimes called nowadays, the gospeller and epistler.) The top step should be deeper from front to back than the others—a clear space 3ft. at the least was necessary in front of the altar, and rather more was better. The other two steps should be at least 18ins. deep (front to back). The height, or rise, was a matter of taste and would be different under different conditions, but it would be found inconvenient if the rise of each step was greater than 7ins. The rise of all three should be the same. The sanctuary itself might be at any level above the chancel that was not inconvenient.

The altar shelf had become very usual nowadays. It was better for it to be behind the altar rather than upon it, unless the altar were very broad, in which case it should be loose. In the former case it became the base of the reredos. The shelf should be from 9ins. to 12ins. wide, to give room for the cross and candlesticks to stand upon it, and it should not be too high.

Reredos.

The object of the reredos was to give dignity and importance to the altar, and this should be the first consideration in designing a reredos. It should be spaced in such a way as not to detract from the altar nor to overpower it, but rather to add to its prominence and make it unmistakably the principal object at the east end of the church. He did not consider mosaic to be suitable for a reredos unless the latter formed part of a complete scheme of mosaic decoration, and he thought it was a safe rule never to use mosaic unless it could be at least 15ft. from the eye. Generally speaking, he thought the reredos was better as a separate thing, not forming part of a scheme of wall decoration, but a definite background to the altar, a sort of solid screen at the back of it, with perhaps the altar shelf or shelves forming part of it.

As to painted reredoses, everyone would find his own method of using colour, but one very good way was to lay on the colour very bright—almost, if not quite, pure—and then to glaze it down with thin coats of colour superimposed till the brightness or crudeness had been brought down to harmonious tone. Personally he much preferred tempera to oil paint. It had a pleasanter quality and darkened less with time.

The Upper Frontal, or Dorsal,

might be of any material (even cotton) and hung in any way that would give a good effect. It could be brought right forward over the altar as a canopy, but it looked much better if the material was in one piece suspended over rods rather than strained over a board. A canopy, however, was apt to get very dirty from the smoke of the candles and therefore it should always be considerably above the altar; and for the same reason it was well to arrange for the candles to stand well away from the dorsal, or from the reredos either.

At either end of the altar should hang

The Curtains or Riddles.

They should be about as wide as the altar, and might be of any height so long as they were well above the candles to protect them from being blown by currents of air.

The dorsal and riddles might be of any colour harmonizing with their surroundings. They were not changed with the frontal to the colour of the day. In choosing the material for them it was absolutely necessary to see a large piece in the church in the position where it was to hang.

Frontals and Frontlets.

The frontal need not be mounted on a wooden frame. If well made with a proper backing it could be hung with rings and hooks under the slab of the altar. The five liturgical colours in the Church of England were white, red, green, purple and black, so that five frontals were required.

The frontlet need not be changed with the frontal, and might be of any colour that would harmonize with the five.

Frontals and frontlets were usually ornamented with embroidery, and, when this was well done nothing could be more beautiful or suitable. But it needed an artist to do it. The firms and the church shops had failed in this respect just as dismally as they had in pictures and windows.

A carpet for the floor and the steps in front of the altar was a great addition—almost a necessity—and Mr. Spooner said he liked to see it brought right down the chancel—giving a fine bit of colour and a strong leading line up to the altar. Tapestries might be used with good effect in many places, particularly on the east wall and around the sanctuary.

Altar Cross and Candlesticks.

The altar cross should not be very large, for it was the standard in front of the priest rather than in front of the people. The great rood answered the latter purpose.

Candlesticks should be of the same material as the altar cross—not necessarily of brass, which was doubtless a good material, though generally spoilt by being lacquered; sometimes a material of another colour would look better.

Font.

After the altar the font was the most important thing in the church. The best place for it was at the west end, in the middle. A cover was essential, but now that the water was blessed at every baptism and discharged into the earth when the service was over, it seemed unnecessary to line the font with lead, unless a porous stone was used. A waste pipe was necessary (with a plug) discharging into a dry well in the ground. A desk to hold the priest's book was a great convenience, though seldom provided. It might be made removable, fitting into sockets in the font.

Piscina and Sedilia.

One did not always find a piscina in modern churches. It was supposed not to be required, but that was a mistake. It was required as much to-day as it was in the Middle Ages, and for similar purposes. It might be made as a beautiful little niche in the south wall of the sanctuary, combined with the credence, although a projecting shelf or table was more convenient than the small shelf found in many old churches. The drain from it should always run into the ground.

The sedilia—the last remnant of the bench which in primitive times ran all round the apse and was assigned to the priests—was a triple seat for the celebrant, deacon and sub-deacon. It should always be on the south side of the sanctuary. In old days it was generally formed in a triple niche, or arcade, recessed in the wall, but of late years it had become more usual to make the sedilia a separate and movable piece of furniture, generally of oak, sometimes with a back and canopy, and, on the whole, it suited us better than stone seats, which were apt to be rather cold. In building a new church it would be well to form a recess in the south wall large enough for three seats side by side, and to fix a wooden seat and back divided into three, allowing a width of at least 2ft. for each seat. There was no longer any need for a canopy now that the windows were filled with glass and the church was comfortably warmed.

Rood Loft.

The next items in the list were screens, the rood loft and the rood. In former days the rood loft was used as a minstrels' gallery, as strolling minstrels were hired for great festivals, but nowadays it was questionable whether a rood loft should be provided unless required for practical use, which would only be the case in some churches. We no longer engaged strolling minstrels who had to be put where they could not get at valuables in case they should be tempted to steal!

Chancel Screen.

There were a few conditions that should regulate the design of a chancel screen. The clergy stalls ought to return against the chancel side of the screen; therefore the lower part needed to be panelled with solid panelling to a sufficient height to form the back of the stalls, from 3ft. to 4ft. from the chancel floor. It was undesirable to block the view of the altar from the congregation, and, unless the altar was raised on steps, a high solid base to the screen would do so. If the chancel were long enough, the floor should be raised only one step above the nave, and the sanctuary three more steps beyond the choir seats, leaving enough space at the east side of the choir seats for easy access to them on their own level—say, 2ft. 6ins. or 3ft. wide. It was awkward for the members of the choir to have to step down to reach their places. Thus, two steps, with a tread of 12ins. each, would ascend from the level of the chancel to a space at least 4ft. wide for the communicants; then one step more to the level of the sanctuary floor. A space of at least 5ft. 6ins. must be allowed before the rise of the next step. (The altar rail, if there were one, should be set 18ins. back from the front edge of the communicants' step, leaving a width of 4ft. within.) Then two more steps, each 18ins. wide, and a foot space in front of the altar 3ft. wide, making a total length eastwards beyond the choir seats of 18ft. 6ins., or 19ft. to the front of the altar. The altar itself would be raised seven steps above the nave—say, 3ft. 6ins. or 3ft. 9ins.: in the former case all steps having a rise of 6ins., in the latter the first four having a rise of ins. and the last three 7ins. The screen would be fixed on the first step, and the panelled base might be 3ft. 6ins. high without hiding the altar. The central opening should be nearly as wide as the altar—7ft. or 8ft. in a narrow church and more in a wide one. It was well to have as few mullions as might be and for them to run up a considerable height before the more intricate and ornamental part of the screen began. Where a loft was not required a strong horizontal line looked well at the top, with or without cresting. In churches where there was no chancel arch Mr. Spooner said he saw no reason why the screen should not run up and be framed into the timbers of the roof, with the rood and any other figures worked into the design of the screen itself. In some churches a high screen might not look well. In such cases a low screen of stone or wood was wanted to stop the return stalls. The rood might then stand upon a beam or, what was better, be suspended in the chancel arch. Most, if not all, mediæval screens were painted, and there was every reason why modern screens should also be decorated with colour.

Gates might be added, either of wood or metal, and in churches where valuable or holy things were kept in the chancel they were most desirable.

Choir Stalls, Seats and Desks.

The growth of the choir in most modern churches necessitated a considerable amount of accommodation, though many churches had too large a choir. The old arrangement could hardly be improved upon, unless it was considered better to turn the choir out of the chancel into a gallery at the west end. One row of seats for men and one for boys on each side of the chancel should be enough for any parish church. It was better not to divide the seats with arms or elbows, as that arrangement would make the whole very long and would fill up the chancel too much. The great thing was to arrange the seats not only to leave plenty of room in the chancel but also to give the appearance of space. Mr. Spooner said he thought it was a mistake to raise the choir seats above the level of the chancel, because then too much prominence was given to the choir. No better arrangement had yet been devised than that of returning the back row of seats against the screen for the clergy. These seats might very properly be divided by elbows when that luxury could be paid for. The advantages of this arrangement were that the clergy were brought well out into the church in the most convenient position for them to take the service.

The desks should not be too near the seats, nor too high; plenty of room should be left for kneeling, and the height made convenient for that attitude; there should also be an extra shelf or shelves for books below the desks. The boys only would want a desk, which should be as small as convenience would allow.

Lectern.

As to the lectern, the eagle form, if artistically treated and made very much unlike a real bird, might be rather nice. But personally he thought the form of a double or single desk was much the best. It might be treated in a great many different ways, with or without candle-holders, and made of either wood or metal. The lectern should stand on a step or platform raised above the level of the nave, more or less according to the size of the church. The top of the desk should not be too high, because the reader's voice would be checked. This was one of the few cases in which utility clashed with appearance.

The Organ.

When planning a church it was important to provide a place for the organ. Much had been said about the best position for it, and he understood musicians agreed that a gallery at the west end, or the rood loft, was the best place for it. But there were objections to both of these places if the church was not very lofty. Unless there was a clearstory a large west window was necessary to light the church, and an organ at the west end would block up that window. Again, it was difficult to make a clearstory look well from the outside unless a good deal of money could be spent on the building. He had not seen a modern inexpensive church with a clearstory that seemed to him to be successful externally. He particularly disliked a lean-to roof over the aisles. Lofty aisles with a flat roof and a parapet got over the difficulty, but this was of course rather expensive and might not suit the position of the church. A minimum height of 17ft. was wanted for an organ, and that would only do for a small one: 33ft. was required for a fair-sized organ. A clear space of even 17ft. above the rood-loft to the wall-plate meant a lofty church. In any case the organ should be divided and placed each side of the loft, as the middle was required for the rood. It was obviously objectionable to shut it up in a small chamber. Perhaps the best way was to provide two small shallow transepts on either side of the chancel for the swell-box and other parts, and to bracket out for the pipes. The drawback to this plan was that it increased the cost considerably.

Organ pipes, unless gilt, looked best their natural colour; if decorated at all, the patterns should be very quiet. It was better to arrange for the organ to be blown by a small gas or oil engine or an electric motor, as being more convenient, and in the long run cheaper, than hand labour. But if the organ was to be blown by hand, then the lever should be so arranged that the blower was not shut up in a chamber where he could not take part in the service.

Pews

should be made as inconspicuous as possible and light in appearance, with either solid ends or framed ends and with low backs to enable people to kneel comfortably and reverently. The rule of the Ecclesiastical Commissioners that seats must be 3ft. from back to back should be looked upon as the minimum—3ft. 3ins. was better. Mr. Spooner said the best modern pews he had seen were designed by Mr. Norman Shaw for the church at Bedford Park. As to material, of course any wood might be used—except varnished pitch-pine, the colour and grain of which would most certainly disfigure any building into which it was put. Cheap pews should be painted and varnished.

Pulpit.

The pulpit might stand in almost any part of the church. The height of the floor of it would, of course, vary with the size of the church, but it should never be very high. The sides should be 3ft. 3ins. above the floor and the top should be broad enough to hold books. A small removable desk was necessary for those who used manuscript or notes: it should be so contrived as to be easily raised and lowered and easily and rigidly fixed: it was best made of metal, with a leather desk tightly strained: the "horrid little cloth" called by the shops "antipendium" should be eliminated. The diameter of the pulpit should be ample, never less than 3ft. A seat was unnecessary. A lower shelf inside was useful for books, and a secure corner for a glass of water. A sounding-board over the pupil was generally advantageous and a background of wood was often helpful to a weak voice. Mr. Spooner considered that wood was very much the best material for a pulpit; it looked well painted and added colour to the church.

Litany Desk: Notice-Boards.

The Litany desk should be large enough for two, or in large churches three, to kneel side by side, and might be covered by a cloth.

Notice-boards, generally such unsightly things, could be made satisfactory with the permanent notices on one painted with good lettering and the other provided with a glazed door and the notices within written by someone who had learnt to write legibly and not disagreeably—with which remark Mr. Spooner concluded his paper.

A discussion followed in which Mr. Harry Sirr, Mr. F. C. Eden, Mr. C. J. Tait, Mr. Fellowes Prynne, Mr. Geoffry Lucas and Mr. Dawber took part. Mr. Sirr mentioned that the rood loft was used in mediæval days not only for minstrels but for little organs, and even the priest said part of the service from it. Mr. Eden thought narrow altars were undesirable, and cited several old examples to show that they used to be almost square. Mr. Prynne said that, as assessor in several church competitions, he had been amazed at the deplorable ignorance of the A.B.C. of church architecture exhibited by many of the competitors, one of whom, he mentioned, sent in a Saxon design "as he thought it had not been used lately." In dealing with the parson the architect had to deal with a faddist who considered he was an expert because he had read Bloxom and others, including Mr. Percy Dearmer (himself something of a faddist). A non-constructional altar might be correct from an ecclesiastical point of view, but the law had not been observed and in country places where there was a difficulty in having a change of frontals the altar was better with painted panels. The reredos had proved one of the most difficult problems to English architects: it would have been better in many cases to have used a dorsal than a poorly-carved reredos. Personally he did not favour tempera work because it did not last; the lime seemed to eat through; he thought oil painting was better, on very coarse canvas fixed to the wall with mastic and lined with white lead. Mr. Lucas expressed the opinion that a few low steps in the sanctuary were better than a "climb." The font should not be put in a baptistery—that was not an English treatment—but well in view west of the south door. A chancel screen was intended to keep people out and must have a gate. Mr. Dawber said it was better to light the altar from either side rather than to have a strong patch of light above. Mr. Spooner, in replying, said the "tempera" he had referred to was an egg medium on a gesso ground. This was durable and had a most beautiful quality. Oil paint got very "horny" and lost in freshness and translucency.

The president announced that the next meeting would be held on February 24th, when Mr. F. J. Osborne Smith would read a paper on "Country Houses and Accessory Buildings."

Obituary.

The Estate of the late Mr. Richard Mawson, architect, of Bradford, who died on December 9th, has been valued at £22,003 gross.

Mr. William Brunton, builder, of Jedburgh, Edinburgh, died on February 5th, aged 67. He was head of the firm of Messrs. William Brunton & Son.

Mr. George Tyrrell, a well-known Government contractor, died at Yarmouth on Friday, aged 84. He constructed the Bembridge forts, the forts between Plymouth and Plympton, and the extensive works at Hurst Castle. He also constructed the Royal Naval Hospital at Yarmouth, built Tenby and Calder lighthouses, and restored the Haisborough lighthouse.

Mr. John Leaning, F.S.I., the well-known London quantity surveyor and author of the standard book on quantity surveying, as well as of others on specifications, the conduct of building work, and the duties of a clerk of works, died recently, aged 65. He had been suffering from acute indigestion for many months and on February 3rd underwent an operation for appendicitis: heart failure followed, and he died a few days afterwards. He was buried on Thursday last. Mr. Leaning was born at Colchester, and as a young man went out to Australia, where for several years he was engaged in the office of the Surveyor to the Crown Lands at Melbourne. He returned to England in 1868 and built up a large and influential practice as a quantity surveyor.

Keystones.

For the proposed National Gallery for Scotland the Edinburgh Town Council has unanimously agreed to offer the Government a site on Calton Hill.

New branch Savings Bank Premises at Lochee, Dundee, have been erected from designs by Messrs. Johnston & Baxter, architects, of Dundee. The building has been successfully adapted to an awkward site.

Sir William Grantham is proceeding with the building of the cottages with which the Chailey Rural District Council was dissatisfied, but the Council has not yet decided what further action it will take.

Colwyn Bay Improvements.—Colwyn Bay is spending £75,000 on a new main sewer and £32,000 on extending the esplanade, the contractors for which are Messrs. Underwood & Brothers, of Dukinfield.

Pulling down York Castle Walls.—The Finance Committee of the York City Council, to whom the matter was referred, do not consider that this is an advisable scheme for providing work for the unemployed.

R.I.B.A. Prizes and Studentships.—The annual exhibition of these drawings at the Alpine Club was visited by nearly 1,100 persons. The number of competitors was 80, as against 73 last year: strainers, 302 and 321 respectively.

The Wellington Monument in St. Paul's.—Miss Florence Le Jeune, the late Mr. Alfred Stevens's god-daughter, writes protesting against the placing of his little lions around the Wellington monument in St. Paul's Cathedral.

Building Construction Examinations, South Kensington.—It should be stated that Prof. Henry Adams, M.I.C.E., has been appointed "a" chief examiner in building construction under the Board of Education, South Kensington, not "chief examiner" as given on p. 81 of our issue for last week. Mr. Slater is also a chief examiner.

A Pump Room and Baths at Matlock Bath are proposed to be erected. The scheme is under consideration by the Matlock Urban District Council, and arrangements have been made for taking the opinion of the residents on the matter. The proposed site is on the bank of the Derwent, on the ground now occupied by Briddon's Mews and the "Fish Pond."

Modern Architecture in London was the subject of a paper read before last Thursday's meeting of the Leeds and Yorkshire Architectural Society by Miss Ethel Charles, who, as Mr. G. B. Bulmer (the president) explained, is the only lady Associate of the Royal Institute of British Architects. Miss Charles said that London was said to contain more bad work than any city in the world for its size, though it also possessed some of the finest buildings in existence, most of which had been erected during the last thirty years. Salt-glazed bricks were not used nearly enough; they had the merit of keeping their colour and did not collect the dirt and grime like stone and brick. Views were shown of New Scotland Yard, the National Liberal Club, the City of London Schools, the London School Board offices, and many others, to illustrate how the general tendency of modern work was to experiment rather than to rely on tradition, how modern work was personal rather than national, and how its endless diversity was intensified by the complexity of modern life and modern requirements, and the large quantity of material within easy reach. Much of the unsatisfactory appearance of our street architecture was attributable to the use of steel, unacknowledged.

The Holborn-Strand Improvement will be completed before the end of this year. The total estimated gross cost was £5,148,920, but the value of the surplus land and capitalized receipts from betterment will amount to £4,750,000, making the ultimate nett cost of the improvement, after deducting recoupment, considerably less than the original estimate of £774,200.

Bournemouth Improvements. — Municipal buildings are to be erected in Bournemouth at an estimated cost of £70,000, exclusive of a sum of £14,000 for the site. The town council has also decided to consider schemes for the preservation of the cliffs and the construction of an undercliff drive at an estimated expenditure of £58,000, as well as the purchase of the Belle Vue Hotel site, near the pier, at a cost of £60,000, on which to erect a kursaal or pavilion.

CLERKS OF WORKS ASSOCIATION.

THE twenty-second annual dinner of the Incorporated Clerks of Works Association of Great Britain was held on Saturday evening at the Criterion Restaurant, Piccadilly. Mr. J. S. Gibson, F.R.I.B.A., presided over a company of 330. After the loya toasts had been given, Mr. John Davie proposed "The Architects and Surveyors," i doing which he cited a very ancient document wherein it was stipulated that if building fell and killed a man the builde should be put to death; in those days ther were no architects or clerks of works or surveyors, and jerry-building was not unknown To-day the architect had a glorious opportunity of embodying the sentiment and purpos of the nation in wood and stone. Mr. Willia Woodward, A.R.I.B.A., replied. Referring t the ancient document in question, he mentioned a further provision that defectiv walls should be strengthened by the builde "at his own expense" to meet the requirements. Nowadays the architect had a tas before him in meeting the multitudinou requirements—more particularly those of th gentlemen at Spring Gardens, then of th borough council, then of the district surveyor, and still further requirements of th adjoining owner. But the architect undoubtedly had a great opportunity. Th "arty architects" had now had their day, an the style of architecture which commende itself to the public would claim to last lik the styles of the mediæval centuries. The had with them that evening Mr. Sidne Young, who held one of the most honourabl positions among quantity surveyors: i which connection Mr. Woodward expresse the opinion that a thorough knowledge o quantities was of excellent service to th architect, who also should take advantage any suggestions that might be made b clerks of works and builders' foreme whose practical knowledge would ofte result in improvements being made in th specifications, and even in the design itsel Mr. J. Aitchison proposed "The Worshipfu Company of Carpenters," to which Mr. Hutton Freeman (clerk to the Company replied. The chairman then proposed th toast of the Association, which, he observe was founded and carried on for intercours to enlarge experience, and to obtain employment for its members; moreover, a benevolent fund was mooted and also a librar It was incorporated in 1882, and now had membership of about 150. Mr. W. Pit (president of the Association) replied to th toast. Other toasts were "The Press, "The Visitors" (proposed by Mr. A. Fincha and responded to by Mr. John C. Hill, of th London Brick Co., and Mr. J. Carmichae president of the London Master-Builder Association) and "The Chairman," propose by Mr. D. W. McInnes.

USHER HALL, EDINBURGH.

The Usher Hall, Edinburgh, continues to be the subject of much consideration. The special committee of the Edinburgh Town Council discussed the scheme for four hours on Tuesday last week. The whole question has now been narrowed down to the clear issue as to whether the hall shall be proceeded with, according to the modified plans, on the site of the Synod Hall, or whether the latter building shall be retained as at present. Sir Aston Webb and Dr. F. H. Cowen have been requested to prepare a report on the acoustics of the proposed hall.

Tenders.

Addressed postcards on which lists of tenders may be stated will be sent post free on application to the Manager, Builders' Journal, *Great New Street, Fetter Lane, E.C.*

Information from accredited sources should be sent to "The Editor" at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless thev contain the name of the Architect or Surveyor for the work.

Brentwood.—For rebuilding the "Queen" inn. Mr. Herbert Riches, architect, 3, Crooked Lane, King William Street, London, E.C. :—

MONTHLY

FIRE SUPPLEMENT

TO THE

BUILDERS' JOURNAL AND ARCHITECTURAL RECORD.

Edwin O. Sachs, F.R.S.Ed., Architect,
Consulting Editor.

Number 4.
February, 1905.

SUMMARY.

There has been an epidemic of country-house fires during the last eighteen months, but householders would do better to take no advice at all and be guided by common-sense alone than be stupidly lulled into a sense of security by incompetent and unreliable advisers. (Page 55.)

The London Building Acts Amendment Bill requires some modifications in order to give London an up-to-date and workable enactment, but with a little "give-and-take," and a little tact with regard to the additional control sought by the London County Council on the administrative side, the promoters' wishes may be met to a very considerable extent to their credit and to the benefit of the metropolis. (Page 52.)

A new combined motor fire appliance has been provided for the Finchley Fire Brigade that is practically a combined chemical engine, fire engine and fire escape, and is self-propelled. (Page 60.)

A National Board of Fire Underwriters has been established in the United States with the object of influencing the introduction of improved and safe methods of building construction, encourage the adoption of fire-protective measures and secure efficient organization and equipment of fire departments, with adequate and improved water systems. (This page.)

The fire losses in the United States and Canada during 1904 were greater than in any year since 1871, when the great destruction at Chicago made a record which can hardly be reached again. (Page 57.)

The London Fire Brigade has now 927 public electric alarm-points in addition to 264 telephone lines to police-stations, public and other buildings. From most of the alarm-points telephonic communication can be at once established with a police-station. (Page 50.)

By the fire tests of the British Fire Prevention Committee, London has been saved from the introduction of many a material and appliance, generally of foreign origin, which unscrupulous vendors have tried to foist upon a public without ascertaining its merits at an official testing station. (Page 56.)

NATIONAL BOARD OF FIRE UNDERWRITERS.

Its "Committee of Twenty"; The Work in Hand.

THE following particulars regarding the National Board of Fire Underwriters of the United States show the progressive spirit with which the leading insurance men in America are now dealing with the question of fire loss from the only properly possible aspect, namely, that of systematic and scientific "fire prevention." We are pleased to note that many of our British insurance companies are represented on the Board and participate in its work through their local officers, and further contribute towards the expenses.

The Board is composed of 120 of the leading fire insurance companies doing business in the United States, and, as set forth in the organization papers, its purpose is to influence the introduction of improved and safe methods of building construction, encourage the adoption of fire protective measures and secure efficient organization and equipment of fire departments, with adequate and improved water systems. The Board has no control over rates of insurance, commissions of agents, &c.

Knowing that the fire waste in the United States greatly exceeds that of other countries, and believing that the Baltimore conflagration would impress upon the public the danger to most, if not all, of our great cities of a like disaster, it was decided to appoint a committee charged with the duty of organizing an engineering department composed of men standing high in their profession and through them to investigate conditions, stating facts as to those existing and making recommendations for improvements that would minimize the sweeping fire or conflagration hazard, especially in the congested or heavy value districts of the cities visited. Accordingly, a staff of engineers has been organized, and to-day there are in the field four parties, each collecting data in some different city, the work being carried on by men who have had experience in civil, mechanical, structural, hydraulic and electrical engineering.

The entire work of the Committee is under the direct supervision of Mr. Herbert Wilmerding as secretary. Mr. Wilmerding has for many years been a close student of the relation between fire insurance and municipal departments, especially in reference to building construction and fire hazards. His work with the Philadelphia Underwriters' Association and elsewhere afforded exceptional opportunities for an intelligent study of the relations between underwriters, architects and engineers in the conduct of municipal work. His study of conflagrations and congested districts has been very broad, both from a logical analysis of conditions presented in the congested districts of cities and from object-lessons derived from past conflagrations.

The Federal Government has detailed two engineers of the United States army to investigate and review the reports of each city, it being the desire of the underwriters that the reports might have final supervision and be criticized by men in no way connected with the business of fire insurance and having no reason for endorsing a report that stated other than the facts and asked for improvements and changes that were not in the interest of the public.

A sweeping fire or conflagration is a terrible calamity, and, occurring in one of their greater cities, would wipe out several hundred million dollars of property values, causing no doubt a great panic from which all of the people of the United States would suffer. It should be borne in mind that, while the insurance companies reimburse the actual sufferer by the fire, the people as a whole bear the burden, and unless the people pay enough for the companies to meet the claims for fire losses, they, the companies, would soon be forced into bankruptcy.

It is a mistaken idea that payment by fire insurance companies makes good the property loss, for property burned is value wiped out of existence, and the insurance companies merely distribute the loss by collecting in small sums premiums from all the property owners and paying in large sums to those who suffer loss by fire.

Property burned is money wasted, and the people of the United States are the most wasteful in the world in this direction. Fire losses being the barometer of insurance rates, it is of interest to note that, according to the statistics collated from the reports of the Superintendent of Insurance of the State of New York for the year 1903, the average rate of premium charged throughout the United States was 1·19 dols. per 100 dols. on the sum insured, while in Great Britain, where high buildings, large areas, poor flues and shoddy construction are prohibited by law, the average rate of premium is about 9 cents; and in Italy, where the construction is still better and the conflagration hazard practically eliminated, the rate is only 6 cents per 100 dols.

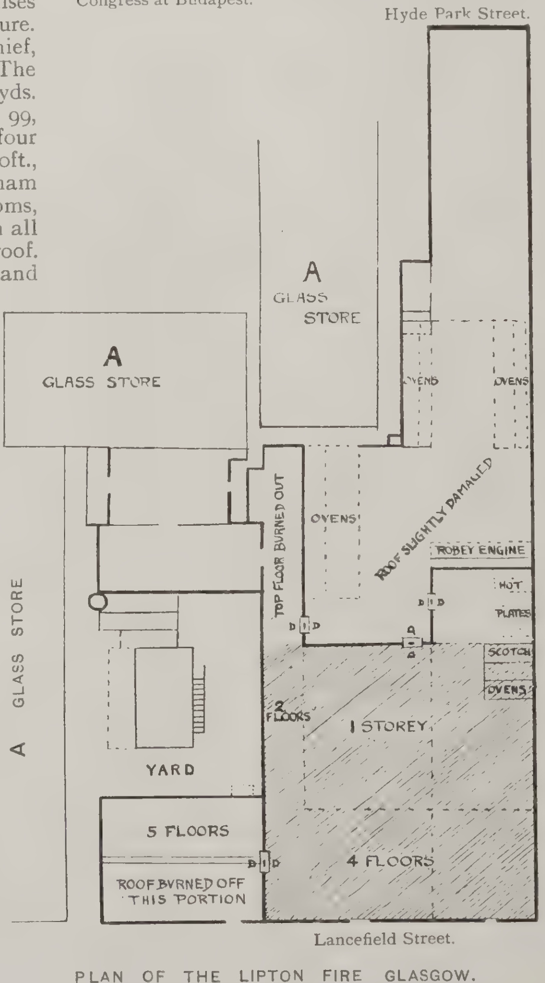
The seriousness of the conflagration danger in American cities is realized by business men generally, and the reception of the reports of the Committee of Twenty of the National Board by municipal authorities and property owners is sure to be a most favourable one. It is earnestly hoped that it will be generally realized that the fire underwriters have no desire to dictate, but intend rather to put facts before those interested, hoping and believing that the result may be beneficial to all concerned.

THE LIPTON FIRE AT GLASGOW: GENERAL VIEW.

A GLASGOW FIRE.

THE following is a report of the fire in Messrs. Lipton's, Ltd. premises, 93 to 99, Lancefield Street, Glasgow, which occurred at 2.58 a.m. on Tuesday, January 13th last:—An employee from Messrs. F. & B. Stevenson's Cranstonhill Bakery, situated in Cranston Street and overlooking Lancefield Street, reported at the Western District Fire Station that he observed a fire, apparently a hoarding, in Lancefield Street. The brigade immediately turned out, and it was seen that the outbreak was in the extensive premises of Messrs. Lipton, Ltd., and of a serious nature. Assistance was at once called out from chief, northern and southern district stations. The western station is situated within 300 yds. of Messrs. Lipton's premises, Nos. 93 to 99, Lancefield Street. A stone building four storeys in height, measuring 110ft. by 60ft., occupied as general provision stores, ham smoking chambers and despatching rooms, was on arrival of the brigade alight on all floors and the fire showing through the roof. This building was completely gutted and the frontage to Lancefield Street fallen in. Adjoining to the north is a building of five floors, 50ft. by 60ft., which communicates with the south block on ground and upper floors by means of openings in gables protected on ground floor only by double iron doors. There is a stone staircase 4ft. 6ins. wide which serves both buildings.

The north building is occupied as general stores, dining-rooms, ticket-writing and stationery departments, ham and bacon curing and mechanics' shops. The fire spread to the upper floor and the roof of the building by an opening which was fitted with a single iron door which was only partially closed. In the result the half of the top floor was pretty well burned out and half of the roof destroyed. Adjoining to the east of the gutted building, and communicating therewith, is a range of buildings partly one and partly two storeys high measuring 110ft. by 100ft., occupied as tin washing and drying-rooms, sausage factory and packing rooms, which are completely destroyed. Abutting upon these buildings is the bakery, the roof of which was slightly damaged.



PLAN OF THE LIPTON FIRE GLASGOW.

FIRE CALLS AND ALARMS.*

By JAMES SHEPPARD, A.Inst.E.E.

THE great importance of subduing outbreaks of fire at their earliest inception has been and still is universally acknowledged. In times when effective appliances for extinguishing fires were not available some attention was given to precautions intended to guard against the outbreak of fire and to prevent it spreading rapidly. All fires and lights were required to be extinguished on the ringing of the curfew bells at an early hour of the night. At a later date special patrol

Watchmen

were appointed and authorized to caution all citizens to be careful with fire and light. Walls of stone 3ft. thick were required to be built between adjoining houses as barriers to the spread of fire, and the practice of dangerous trades in districts congested with buildings, was prohibited.

In many cities watchmen were stationed on high towers to look out for and give an alarm of any fire they might discover, indicating its locality by flags or lights, some improvement on which method was shown by the use of plans or charts of the town upon which the intersection of sight lines was noted, indicating more definitely the locality of a fire, the information thus obtained from the tower being lowered to the watchman at the street level. In some cities this practice of keeping a watch for fires on high towers still continues.

Bells

were provided in church towers or on public buildings to give alarms and call help when fires were discovered. One such bell in the abbey church at Sherbourne, Dorset, bears the motto dated 1652:

> "Lord quench this furious flame.
> Arise, run, help, put out the same."

The foregoing arrangements for discovering and giving alarms of fire could not have been satisfactory, as it is clearly important to have notice of the outbreak of a fire before any light it might give could be discovered from a distance, and these regulations do not appear to have inspired much confidence, for we find that in London in 1553, and again in 1605, royal proclamations were issued against the erection of further buildings "for avoiding of the rage of fire."

The various precautions referred to appear to have been frequently evaded or altogether neglected; at any rate they did not effect the object in view, for during mediæval times many cities and towns experienced sweeping conflagrations, and in 1666 the greater part of London was destroyed by fire. After this disaster more stringent precautions were adopted; a special fire-watch and bell men were appointed and all constables were authorized to make enquiry twice a year "of the security of hearths, ovens and stoves and places for laying fire ashes in," a very wise provision which might again be enacted and extended with great public advantage.

Rewards for Quick Attendance.

On the general introduction of fire engines with hose about the year 1700, the necessity of early attendance with the engines at the scene of the fire was fully recognized. Having this in view, rewards were authorized to be paid to the amount of 30s. to the keeper of the first engine to arrive, 20s. to the second, and 10s. to the third, and the turncock who first provided water from the mains for the use of the engines was paid 10s. The engine keepers and turncocks shared these rewards with persons who first gave them information of the outbreak of fire, and thus established the system of fire calls by runners or messengers which continued in London for about 170 years, and is still in force in many provincial districts. This system of rewards obviously lent itself to serious abuse, and it was found that many fires were started with the sole object of obtaining the call money.

As the result of any enquiry made in 1871 no fewer than seventy-four fires which occurred during eight months in London were found to have been started by one man, who under different names and addresses received the call money. Shortly after this the payment of rewards for fire calls was discontinued.

The application of the electric telegraph made it possible to dispense with calls by messengers or other means, and the use of telegraphic fire-alarms gradually superseded previous methods of giving calls to fire brigades. The first complete system of

---

* A paper read before the 1904 International Fire Congress at Budapest.

Public Electric Fire-alarms

was provided in connection with police-stations in Berlin in 1849. Other cities experimented and after a time adopted similar systems of alarm signals.

The fear of false alarms, either from defects in the equipment or from malice, delayed general approval of public electric alarms, and they were not adopted in London until 1880, when forty call points on six circuits were provided, from which in that year forty-four good calls were received and thirty-three false alarms, but only in one instance was a person detected in tampering with the alarm.

The London Fire Brigade has now 927 public electric alarm points in addition to 264 telephone lines to police-stations, public and other buildings. From most of the alarm points telephonic communication can be at once established with a police-station.

Since the fixing of

Electric Call Points

n the streets of London the proportion of alse alarms has increased from about 7 per ent. of all calls for fires to about 20 per cent., out notwithstanding this the system is admitted to be indispensable and of good ublic utility. Malicious alarms now show marked decrease, the number of these eported in 1903 being 126.

Various arrangements are made in different ities to guard against the abuse of electric all points, but all tend to cause delay and nay prove the greater of two evils.

As an addition to the public electric fire-alarm call boxes, numerous call points are now provided on the different floors of large establishments in American cities, and probably in some cities of other countries, connected with the nearest public alarm-box, through which alarms can be sent direct from various parts of the building so equipped to the fire-brigade stations or to a central depôt in telephonic communication with the brigade.

Wireless telegraphy has also been used for fire-alarm purposes and may prove of value in special circumstances.

Automatic Alarms.

All the systems above referred to rely on some person discovering an outbreak of fire and operating the alarm. They are known, therefore, as manual alarms. These have been found to be generally satisfactory, especially in connection with an organized fire watch.

Many efforts have been made in the past to secure an automatic alarm operating by an undue increase of temperature in any part of a building, thus announcing the outbreak of fire, but these devices were not found to be permanently reliable. In more recent years, however, renewed efforts have been made, with every prospect of success.

With automatic sprinkler installations the provision of alarms operating on the opening of a sprinkler head, whether from heat or leakage, is indispensable. In other systems, any of which can be used in connection with sprinklers, devices known as heat detectors or thermostats are distributed over all parts of the building to be protected. Any one of these is based on an increase of temperature up to a determined point; it makes or breaks an electric circuit, and transmits an alarm to any point desired, indicating the building, floor or room from which the alarm is given.

Devices Employed.

Various applications of the law governing the changes of different substances under the action of heat have been devised for securing the desired end, such as the melting of specially prepared solder, the expansion of or changes in springs or rods of metal, or of mercury in tubes, the expansion of air operating an elastic metal diaphragm, air-pressure or vacuum release, the expansion of liquids breaking slight glass bulbs, and the elongation of wire. In a device recently introduced the elongation of wire and the release of air under pressure are used in combination, both for giving an alarm and for opening the main valve of a sprinkler installation, the sprinkler heads being opened by a similar but distinct wire elongation. The alarm can be given at any point required by an automatic electric current.

In many cases automatic fire-alarms are maintained and controlled by the companies supplying them, all alarms being received by officers of the companies at the fire station or at separate central stations, from which they are transmitted by telephone to the fire station with full particulars as to locality. This latter arrangement is followed in London, a fine of £10 being payable if a false alarm is given.

The various systems may be said to be still on their trial. The outcome will be the survival of the fittest.

The foregoing remarks apply more particularly to Great Britain, but it will be found that the practice and experience has not differed in other countries to any great extent, except that in some cases improved methods were adopted at an earlier date than in Great Britain.

The advantage gained by a fire brigade

THE LIPTON FIRE AT GLASGOW: INTERIOR VIEW.

receiving the earliest possible notice of an outbreak of fire cannot be over-estimated, and any system which secures this in a reliable manner will be a distinct public benefit. The National Convention of Fire Chiefs of the United States unanimously resolved at their meeting in 1871 that a thorough and efficient system of telegraphic fire-alarms giving early and definite information of the existence and locality of a fire is of primary importance to the fire department of every city and town, which resolution will doubtless receive universal approval.

Importance of Planning and Construction.

While fully acknowledging the supreme importance of early alarms of fire, it is desirable at the same time to emphasize the equal importance of planning, constructing and protecting commercial and other buildings, both internally and externally, so as to check the rapid spread of fire, and thus afford fire brigades reasonable opportunity of preventing conflagrations. Experience has repeatedly shown the necessity of this, even in cases where the premises involved have been installed with sprinklers or automatic alarms.

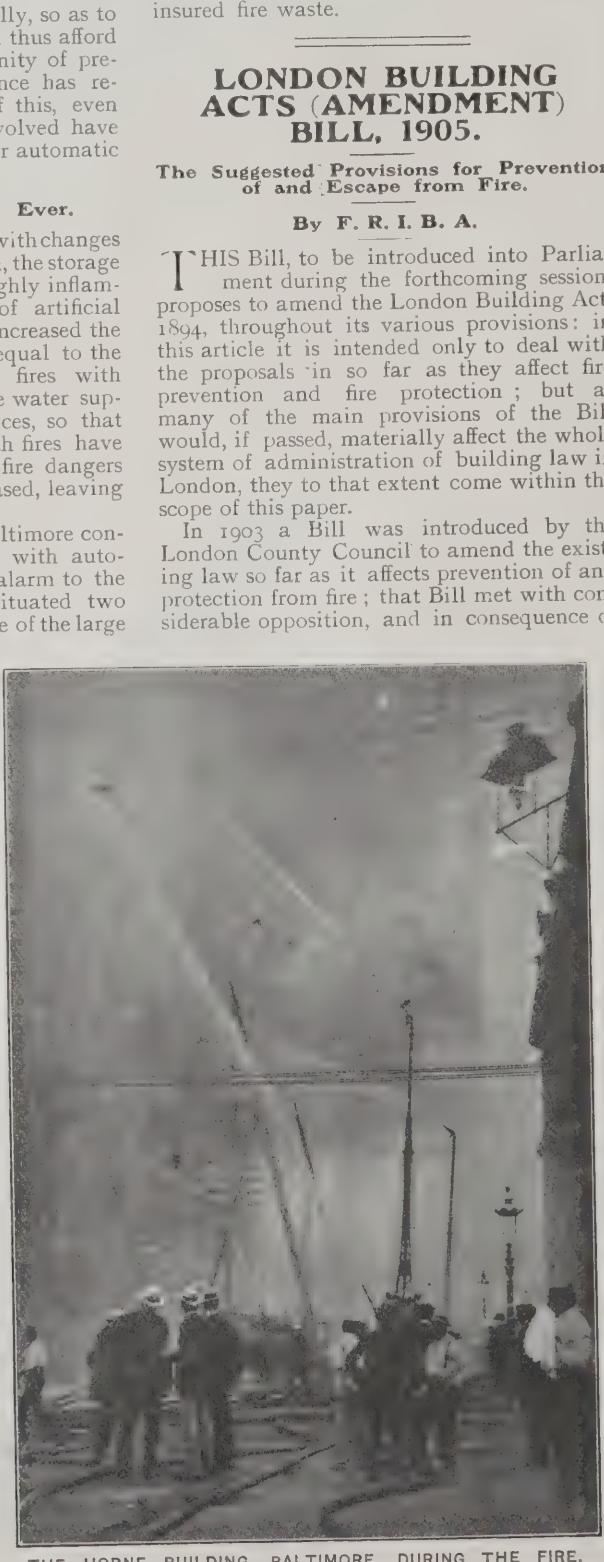
Fire Dangers as Great as Ever.

The concentration of businesses, with changes in the manner of conducting them, the storage and general use of new and highly inflammable substances, new modes of artificial lighting and other causes, have increased the fire dangers to an extent fully equal to the improved methods of fighting fires with automatic fire-alarms, up-to-date water supplies and extinguishing appliances, so that while facilities for dealing with fires have been enormously increased the fire dangers have also correspondingly increased, leaving the nett gain practically nil.

The building in which the Baltimore conflagration originated was fitted with automatic fire calls which gave an alarm to the Fire Patrol and Engine Co. situated two blocks distant, but in consequence of the large undivided area of the building, the existence of wide openings through all floors from basement to roof, and wood linings to walls and ceilings, the early call was of no avail.

The great danger constantly present where large warehouses filled with combustible goods (like the Hurst building at Baltimore) are in proximity to each other has been often referred to. Twenty years back Captain Shaw published the following remarks on the subject: "At the present rate of progress the day cannot be far distant when firemen may be compelled to say that they are unable to deal with the vast masses of property which merchants insist on bringing together within one risk; but it is hard on a fireman to have to own himself beaten, even when he knows he is, and it is still possible that in the end the quantity of stock massed together in one risk will be limited not by the warning or appeal of firemen but by the self-interest of merchants when they find insurance rates prohibitive."

Since the foregoing was written its truth has been shown by the costly experience of many cities.



THE HORNE BUILDING, BALTIMORE, DURING THE FIRE.

BALTIMORE.

In a fire supplement of this description it is impossible not to make some reference to the Baltimore conflagration on the first anniversary of its occurrence. We dealt with this terrible fire at some length, with illustrations, in our first supplement of November 23rd, 1904, and on this occasion we, by way of reminder, are presenting two illustrations indicating the terrors of this outbreak.

Earlier in this supplement we present the eminently interesting particulars regarding the National Board of Fire Underwriters' intentions to examine into the fire risks of various American cities, which particulars at the same time throw a very pleasant light on the enlightened policy of that able body. On p. 57 we show the terribly increasing fire loss of the North American continent as far as ascertained from the records of the insured fire waste.

LONDON BUILDING ACTS (AMENDMENT) BILL, 1905.

The Suggested Provisions for Prevention of and Escape from Fire.

By F. R. I. B. A.

THIS Bill, to be introduced into Parliament during the forthcoming session, proposes to amend the London Building Act, 1894, throughout its various provisions: in this article it is intended only to deal with the proposals in so far as they affect fire prevention and fire protection; but as many of the main provisions of the Bill would, if passed, materially affect the whole system of administration of building law in London, they to that extent come within the scope of this paper.

In 1903 a Bill was introduced by the London County Council to amend the existing law so far as it affects prevention of and protection from fire; that Bill met with considerable opposition, and in consequence of such opposition was withdrawn. A general amendment of the Building Act was taken in hand by the County Council, and the Bill now under consideration is the result.

The principle underlying existing and previous building legislation in London has always been to set out definite rules and provisions in the Act so that any persons commencing to build may know exactly what the law requires of him; it is now proposed to alter this convenient state of the law and to substitute in many instances the inconvenient provision that, in the case of certain buildings specified, no person shall erect any of them without first submitting plans to the County Council, and that the buildings be constructed in accordance with their requirements, a notice of which requirements are to be served on the owner as soon as reasonably practicable after the deposit of the drawings. As the buildings to which this provision would apply constitute a very large proportion of the buildings in London the loss and inconvenience consequent on such a proposal may be easily imagined. No matter how excellent many of the provisions of the Bill may be, this change of principle has already created much opposition and may eventually wreck the proposed enactment.

It will perhaps be most convenient to consider the fire proposals in the order in which they appear in the Bill; and for the sake of brevity it is proposed to adopt the Parliamentary term "clause" when referring to any of the subdivisions of the Bill, reserving the term "section" for those of the Act of 1894.

The first clause to demand attention is clause 60, intended to amend section 54 (dealing with openings and recesses in external walls); the effect of this clause would be t limit the openings in any one storey above the ground floor to one-half the area of the wall in that storey and to three-quarters the length of the wall. Though the present sectio is capable of improvement the new claus would hardly affect that improvement, an would in many cases be found impracticable a somewhat similar suggestion was inserte in the first edition of the Bill (now the Act of 1894, but was abandoned.

Clause 62, a verbal amendment of sectio 59 (dealing with party parapets), is cumbersome; the omission of two words from th section would with greater clearness produc the same effect as the insertion of the word proposed. A new sub-section is inserted t get over the difficulty experienced when tw external walls adjoin and together do dut as a party-wall; it is proposed that unles these external walls have a parapet "1f above the highest part of the roof flat c gutter" they shall be subject to the rules f party-walls; this is somewhat vague, a it is not clear what is meant by the highes part of the roof—is it the ridge, which ma be 20ft. or 30ft. away? Surely it would b better to require the same rules for thes external walls as for party-walls, and so d away with the subterfuge frequently adopte of constructing two contiguous extern walls and so avoiding the wholesome restri tions on the party-wall.

Clause 63 provides for parapets to extern front walls of new buildings "abutti immediately upon the public way. T object of this is not obvious: possibly it intended as a protection for persons on t roof escaping from fire; if so, equally effect means could be provided without the enforc production of such unsightliness. Some su provision occurred in the Act of 1844, a to this possibly the "miles of monoton of many of the London streets is attributab The enactment of such a clause wou encourage the objectionable systems of roofi so common in early nineteenth - centu houses, with a valley gutter in the cen parallel to the party-walls, thus renderi escape from the roof of one building to t next a matter of some difficulty.

Clause 64 as drafted would amend section 62 (1) so that in buildings less than 80ft. in height more than two storeys in the roof might be constructed, provided that one side only were enclosed by roof; this cannot be intended.

Clause 65 would require all stoves and chimney-pieces to be set solid and all cavities to be filled with brickwork or concrete; this is undoubtedly a very reasonable demand in the case of stoves, and a practice generally adopted, though difficult to supervize; but it is unnecessary and impracticable in the case of chimney-pieces set upon the face of the chimney breast. What is wanted is a provision that the arch of the opening in the chimney breast shall not be higher than the opening in the chimney-piece, so that in all cases the chimney-piece shall be fixed on solid brickwork.

Clause 66 supplies various small and mostly verbal amendments of section 64 dealing with chimneys, hearths and flues, generally improvements, though as they would have to be read into the existing sections inconvenient in application. A new provision that flues shall not approach within 2ins. of the centre of a party-wall, therefore prohibit-interlocking and overlying flues in those walls is a much needed improvement: as also is the approval of an iron withe between a smoke flue and an air flue in the same stack, though the thickness demanded (1in.) is excessive, and there is no provision for the proper building-in of such plates. The building into flues of iron or steel joists is also very properly to be prohibited.

While on the subject of chimneys and hearths, it will be as well to draw attention to the absence from the Bill of any provisions for hearth. In the case of stoves of the well type, as the present rules for hearths in section 64 are hardly applicable, this omission should be supplied.

Clause 77 proposes a most retrograde alteration in the law of sub-division of warehouse buildings (as now contained in section 75), which would practically abolish the present limit of 250,000 cub. ft. As the law now stands, that subdivision must be by party-walls *(Holland & Hannen* v. *Wallace*, 55 J.P., 132), and any openings for doorways must be fitted with proper party-wall doors. It is now proposed to accept a subdivision "by party-walls or floors constructed throughout to the satisfaction of the Council," presumably floors of fire-resisting materials (of this more will be said when we come to deal with the schedule). Should the proposed amendment become law it will mean the practical abolition of the party-wall as a means of subdivision of warehouses into fire risks; with a storey of 10ft. in height, the limit would not be reached until a floor space of 25,000ft. had been exceeded (about five-eighths of an acre); very few buildings would cover that space, and, as the wall between the warehouse and the staircases serving the various floors could not be considered as a party-wall, there would be no compulsion to fit the doorways in that wall with party-wall, or even hardwood doors; the existing provisions (themselves hardly sufficient) would be wittled down to the mere construction of very indifferent fire-resisting floors. Instead of relaxing the existing provisions, they should be strengthened; the requirements of the Act of 1894 are somewhat weaker than those of the Act of 1855, as they are confined to warehouse buildings to the exclusion of other buildings used for the purposes of trade. It has very reasonably been suggested that the limit should be 100,000 cub. ft., except when the floors are constructed of fire-resisting materials, when the present limit of 250,000 cub. ft. should apply.

It is also proposed to repeal the conditions (section 76) on which the Council may consent to a building exceeding the 250,000ft. limit, leaving their discretion unfettered.

Clause 78 contains several extra powers to the Council to enable them to consent to the uniting of buildings otherwise prohibited; to these powers, being dispensatory, no objection can be taken, provided than an appeal to the tribunal of appeal be allowed to the applicant. It also provides for the proper provision of bolts and fastenings to party-wall doors, without which such doors are of little practical use. Fire-resisting doors of other material than iron are proposed to be accepted if approved by the Council.

The insertion of a new definition of "uniting buildings," clause 78 (6), should dispose of the peculiar opinion held by some persons that buildings are no longer united when the opening in the party wall is fitted with iron party-wall doors.

There is still a hiatus in the provisions of the Act of 1894 relating to openings in party-walls that the Bill as drafted would not fill. Provisions are required to deal with the making of an opening in a party-wall subsequently to one irregularly made (to meet the case of *Woodthorpe* v. *Spencer*, 63 J.P., 246); for the proper registration of openings in party-walls and periodical supervision to ascertain that regular conditions continue; for the regulation of openings left at the time of erection in the party-walls dividing new buildings, when the possibilities of letting the buildings together or separately are undecided, and the proper closing of such openings when the premises are at any time let separately. Difficulties in these and many other cases occur in practice, and should be removed by a comprehensive set of rules. The efficiency of a party-wall depends upon its integrity, and there are under the existing law many cases where the district surveyor is powerless to secure such integrity.

Clause 80 supplies a defect in the Act of 1894 concerning the width of exit doors in churches and chapels, requiring them to be of the minimum width laid down for corridors, but apparently only up to 4ft. 6ins. wide; this will require further consideration; the maximum width of corridor required under the Act of 1894, viz., 9ft., would be of little use were it to lead to an exit door only 4ft. 6ins. wide. The necessity of clause 81 requiring automatic bolts to the exit doors of all places of public assembly may be questionable.

Clause 82, which makes it quite clear that the rules of the Act apply to the enclosure of railway arches, is a desirable amendment; as also is Clause 83, requiring the subdivision of a shop into several to be executed in fire-resisting material, though, the work being done under the supervision of the district surveyor, the words "to the satisfaction of the Council" are impolitic.

Clause 84 (1) attempts to deal with the much vexed question of the making of openings in the upper part of a wall the lower part of which is undoubtedly a party-wall. Apart from the merits of the proposed clause there are two very important defects that present themselves; as drafted, the rules would undoubtedly apply in a horizontal as well as in a vertical direction, but it would not include the case of an external wall dominating the contiguous external wall of the adjoining building, a case that, equally with the party-wall, demands restriction. The proposal contained in the clause is that no opening shall be made in "the part used as an external wall" within 10ft. of "the part used as a party-wall." This is hardly definite, but presumably it means within 11ft. 3ins. of the lower roof in a domestic building and 13ft. in a warehouse more than 30ft. high; equally possibly it may be interpreted to mean 10ft. in either case. It will be unnecessary here to go into all the law cases bearing on the point (never yet categorically decided in the High Court) whether the upper portion of the party-wall where it encloses one building is or is not a party-wall; suffice it to say that, notwithstanding the obvious intention of the Act of 1894, it has been found in practice all but impossible to restrict openings in that situation. The clause is an effort in the right direction, but does not go far enough; nothing but an absolute prohibition of any opening (except a small ventilating grating) will really meet the necessities of the case. The limit of 10ft. is far too small: this has been demonstrated on many occasions. Another serious difficulty in the application of the clause presents itself: when the window is once constructed what is to prevent the owner of the lower building raising his building, so obliterating the 10ft. margin? Absolutely nothing either in the present law or in the proposed Bill—the clause at once becomes a dead letter. Either all windows must be prohibited or the limit should be at least 25ft., and the lower roof should be of solid fire-resisting construction; also provision must be inserted to prevent the raising of the lower building without the bricking up of the windows.

Clause 84 (2) is not easily intelligible; it seems to aim at preventing any window in one building being within 30ft. of a window of another building opposite thereto and within 15ft. on either side. This appears to abolish all back additions and similar projections, also all streets and light wells less than 30ft. across, unless the difficulty could be got over by the erection of a solid wall in front of each window. This clause would seem moreover directly contradicted by clause 106, which provides for special glazing and shutters to windows within the limit here prohibited.

Clause 87 provides for the protection from fire of constructional ironwork; the provision is desirable, but needs modification. The suggested method of dealing with steel

BALTIMORE FIRE BRIGADE AT WORK ON A WAREHOUSE.

skeleton buildings (clause 89) by entrusting the Council with power to make "regulations" in no way meets the necessities of the case; such regulations would not be subject to the conditions imposed on the making of by-laws by section 164 of the Act of 1894, but could be made by the Council without consulting any professional body. The subject is far too important to be dealt with otherwise than by direct enactment. The Royal Institute of British Architects drafted an excellent set of rules, and these should be given Parliamentary sanction.

The next clause to be considered will be clause 91, which would require all buildings more than 50ft. high to the level of the top floor, all buildings containing a shop that projects more than 5ft. from any external wall of the building, and all buildings (except dwelling-houses for one family) in which twenty persons sleep or are employed to be constructed in accordance with the requirements of the Council as imposed for each building. These requirements are proposed to cover danger from fire and escape from fire. At the time of giving notice to the district surveyor (*i.e.*, two days before commencement) notice is to be given to the Council, with a full set of plans in duplicate, and "as soon as practicable" (weeks or months) afterwards the Council are to issue their requirements, and that although the builder is entitled to commence building at once. It is difficult to conceive that these suggestions will be passed; the buildings affected would include almost every building in London with the exception of private dwelling-houses for one family. Such a provision, if passed, would practically abrogate the provisions of the Act in respect of all these buildings, and substituting the special demands of the Council, which of necessity would vary from time to time. Such proposals could hardly be allowed by Parliament. Uniformity would be impossible, and the loss of time and money and inevitable friction caused by such an arrangement would be incalculable. What is required is a carefully considered definite set of rules dealing with each of these classes of buildings to be administered, as the other rules of construction are, by the district surveyor; the drafting of these is a simple matter upon which valuable suggestions by various professional bodies and committees have already been made.

Clause 97 provides for the application of identical provisions to existing buildings. To this there will be, naturally, even greater opposition. It must, however, be admitted that if necessary rules for protection are to be confined to new buildings, progress will be very slow; some measure of retrospectiveness must be conceded, but the proposal now made would enable the Council compulsorily to require the reconstruction of half the buildings in London with scarcely any limitation of their powers in this direction.

Clause 98 provides for arbitration in case of objection to the Council's requirements. It is not clear whether this is intended to apply to new buildings as well as to existing buildings, but if so, the intention does not appear to be carried out in the drafting.

Clause 101 contains provisions for the separation of buildings, and is intended to be in substitution of section 74, to be repealed.

The first rule, dealing with the separation of buildings from each other, is no improvement on the present Act; it introduces the impolitic words "to the satisfaction of the Council," entailing constant application to that body; all that is wanted is to make it clear that "a proper party structure" is what everyone understands it to mean, a substantial self-supporting floor constructed entirely of fire-resisting materials—if the expression may be allowed, "a horizontal party-wall." This might be done by definition, leaving the existing sections unaltered.

The following rule is intended to take the place of section 74 (3), relating to the separation of tenements within a building. The Act of 1855 provided for the separation by party-walls and party arches or fireproof floors of tenements in a building exceeding 36 squares; the Act of 1894 reduced the limit to 25 squares and omitted the obligation to separate by-walls, leaving only the requirement of the fire-resisting floors, but also demanding fire-resisting staircases. This was done to meet the case of City offices, where it is impossible to say at the time of building how the rooms on each floor will from time to time be let. It is now proposed to revert to the original form, but reducing the size of the buildings affected to 20ft. in height and 8 squares in area, and also requiring fire-resisting staircases enclosed by incombustible materials in building exceeding 25 squares. This will cause a recurrence of all the old difficulties, and the more so as the limit and squares are so severe. It may very reasonably be said that this limit is too low, including, as it will, practically all buildings built for two or more families. It may also fairly be contended that height rather than area should also regulate the application of any rule for separation; a limit of 50,000 cub. ft., thus combining height and area, would probably be found reasonable. What is wanted is one rule for tenement dwellings requiring separation vertically and horizontally, and another rule for offices requiring only the horizontal separation, with fire-resisting staircases in each case.

Clause 101 (4) proposes to limit buildings of the class just dealt with to 50 squares, unless the Council otherwise consent. No objection can be taken to allowing dispensatory powers to the Council, but it is undesirable to make the restriction too severe so as to necessitate that dispensation. A more reasonable clause would be to apply the 250,000 cub. ft. limit as in warehouses, thus allowing larger buildings divided into compartments with party-walls and party-wall doors, but in that case a proper staircase and means of exit should be required for each compartment; this would work automatically and avoid constant applications to the Council.

Clause 101 (5-9) is in substitution for the present section 74 (2), requiring the separation of trade from dwelling premises within the same buildings exceeding 10 squares in area. Upon the existing law it is no improvement, as it perpetuates the defects found to exist. The difficulty disclosed by the case of *Dicksee* v. *Hoskins* (65 J.P., 612) has not been touched upon. It is essential that the clause should categorically require the provision of a structural division between trade and dwelling. Rule 8, though reconstructing the words of the present law as to the openings for communication between the trade and dwelling, falls into a worse error, as though it requires fire-resisting doors between the trade portion and the staircases and passages leading to the dwelling, makes no such provision for direct openings between trade and dwelling when on opposite sides of the same wall, in which case there is obviously a greater necessity for such protection. Rules 6 and 7 require passages and exits to the street of a width dependent on the width of frontage, an obviously inequitable basis to go upon, as the requirements of exit must depend on the size of the building and number of persons rather than the frontage. Provided that a proper exit be afforded there is no necessity for valuable frontage to be taken up to provide it; an exit only 2ft. 6ins. wide, possibly 80ft. long, is encouraged by being specified for 20ft. frontages, a shorter and wider exit to the rear and so to some streets would be more efficient and interfere less with trade. The rule further encourages constant application to the Council by providing for other means of escape to the satisfaction of the Council; matters of such everyday occurrence as buildings of this class should be the subject of clear rules applicable by the district surveyor. Rule 9 seems really to be a duplicate of a clause in the fire-resisting material schedule and should be expunged here.

Clause 102 proposes to deal with rooms over places where inflammable liquid is stored, but in the same impolitic way by special reference to the Council. Surely if these cases can be dealt with by that body as each comes before them, they can put forward some reasonable rules applicable to all cases. If the rules for the separation of trade and dwelling in buildings of 10 squares in area were applied to buildings, whatever their area, for the storage or sale of inflammable liquid (which should be defined) the case would be met.

Clause 103, dealing with boarding and panelling as an internal finishing to walls and ceilings, are altogether insufficient; it is impracticable to avoid some little space behind the boarding, and the danger is due not so much to a small space as to the continuity of the space throughout the building. In buildings of the warehouse class, and in shops and other business premises, boarding and panelling should only be allowed as a lining to a room, the floors, walls and ceilings of which are of or filled in with fire-resisting material, and the space behind such boarding is no more than is required for the necessary fixing battens. In dwelling-houses it would be sufficient if the wall or floor to which the boarding was affixed were fire-resisting. Some consideration should also be given to panelling as distinct from matchboarding. The restriction should be aimed principally at the wholesale use of matchboarding in trade premises.

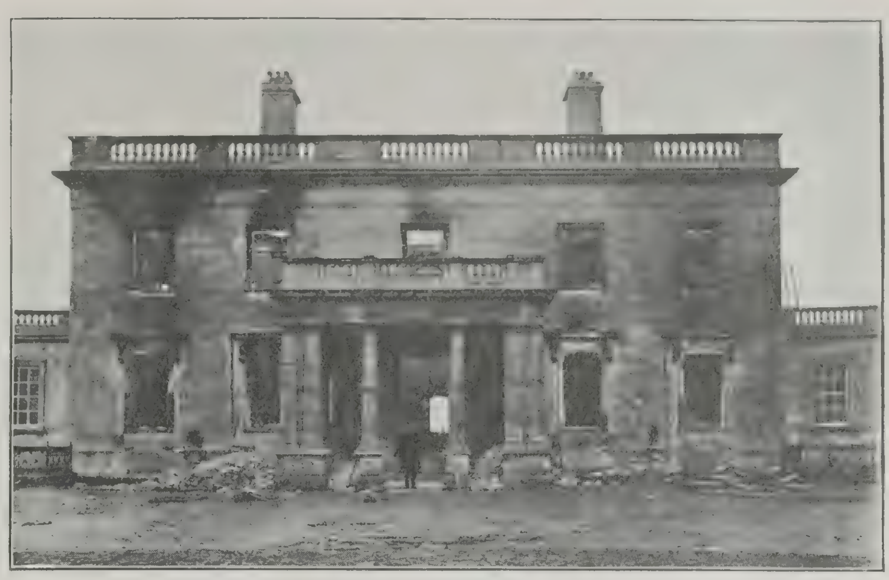
Clause 104 provides some excellent rules for the construction of lift enclosures, which might with advantage even be carried a little further. These provisions are to extend to all existing lifts after seven years—a very desirable provision.

Clause 105 is an attempt to deal with the question of the escape from buildings by the roof, but is hardly happy. It draws no distinction between terrace buildings, where escape to an adjoining building may be possible and useful, and detached and semi-detached buildings, where such escape would not be possible. It is clearly useless to provide an escape to, unless an escape also be provided from, the roof. This clause will require very careful reconsideration, particularly because it is to be retrospective.

Clause 106 proposes that windows within 30ft. of windows in a warehouse building shall be of metal frames glazed with fire-resisting glazing, and that the corresponding windows in the warehouse shall be fitted with iron or armoured doors or shutters. As already pointed out, clause 84 (2) seems to prohibit these windows altogether, without consent of the Council. This clause, as it now reads, appears too drastic.

Clause 159 proposes to confine the exemption of railway companies to buildings and structures exclusively for the companies' use, excluding from the exemption structures "in connection with" the traffic; this is a valuable improvement, the various wooden erections set up as offices and stores for private firms (held by the Courts in the case of *Elliott* v. *L.C.C.*, 63 J.P. 645, to be within the exemption because the goods are carried on the company's lines) are in many cases a standing menace to adjoining property. While, however, curtailing the railways exemption, it is proposed to create a new exemption (clauses 159 and 161) in all the buildings and structures of the County Council and all the other public authorities; this proposal is most unwise for the promoters of the Bill, and practically gives a point to any opposing party. What is more, most of these buildings would be public buildings used as schools, infirmaries, workhouses,

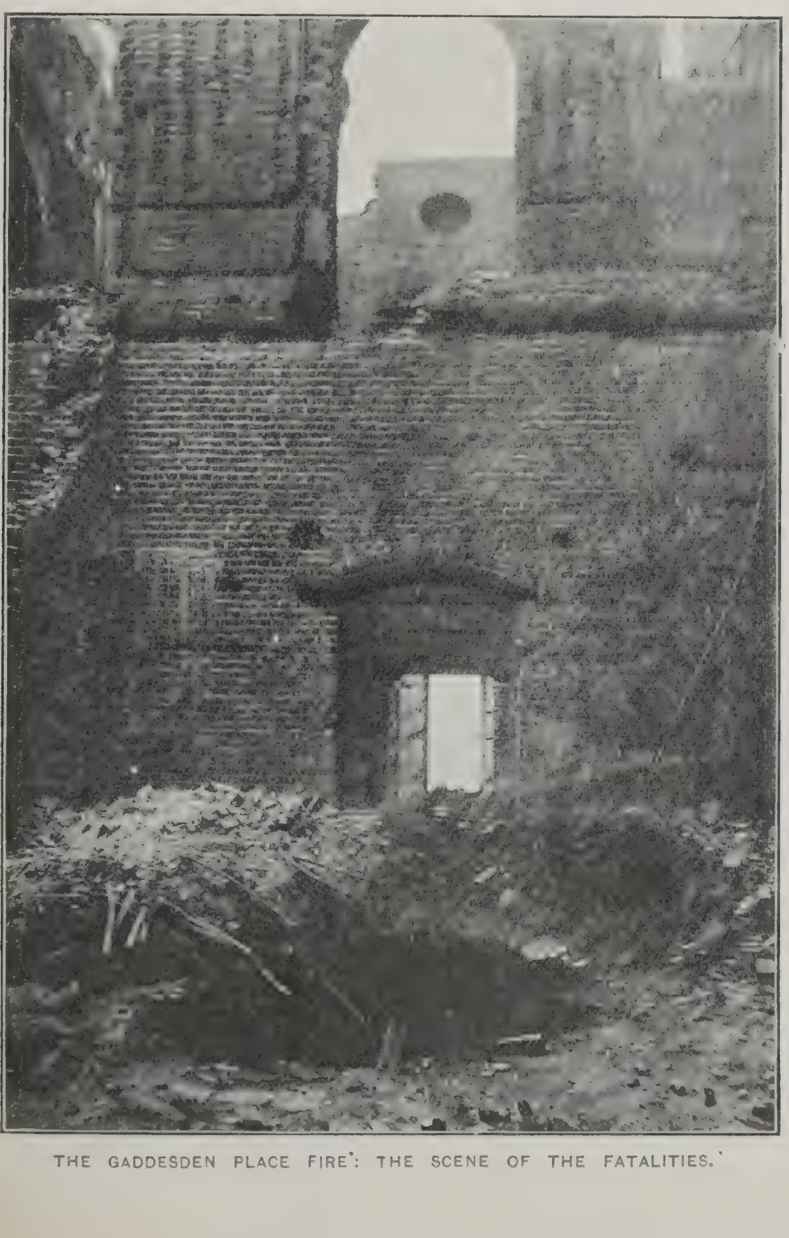
&c., where children, sick, infirm and aged persons would be housed; surely there are no buildings where it is more necessary that proper provision for fire-resisting construction and escape in case of fire should be rigidly observed. All buildings, whether belonging to public authorities or private individuals, should be subject to the same laws.



GADDESDEN PLACE: THE FRONT AFTER THE FIRE.

The first schedule (fire-resisting materials) is an improvement on that in the Act of 1894, to be repealed, though it might in several respects be still further improved. There is, however, one provision in particular to which exception must be taken, as far as new buildings are concerned, *i.e.*, the acceptance as a fire-resisting floor of wood joists with a pugging of concrete 5ins. thick carried on wood fillets fixed centrally in the depth of the concrete. Though there are many objections to the use of wood, particularly deal, in floors supposed to be fire-resisting (notably the dense smoke given off, and the chances of rot and shrinkage), for its retention in existing floors to be made fire-resisting, something may be said on account of the impracticability in many instances of removing the whole floor to substitute one of steel and concrete; but in the new building such reasons do not exist, and a really fire-resisting floor should be required. Moreover, the schedule as drafted would allow of the construction of a floor that would fail in a very short time; it would allow the pugging to be flush with the top of the joist, leaving, in the case of an 11in. joist, the lower 6ins. exposed to the fire without even the protection of lath and plaster. A wood and concrete floor should only be allowed in an existing building, and then only if the concrete be level with the soffit of the joists and without rough boarding of any description, the whole being protected on the underside with metal lathing and plaster. Though the smoke danger is still present, a floor thus constructed will resist a fierce fire for two hours.

There can be no doubt that the present law requires amending and strengthening; but the present Bill certainly requires some modifications in order to give London an up-to-date and workable enactment. Further, if some of the provisions on the administrative side regarding the proposed additional control by the County Council are not waived at an early opportunity, it may be safely assumed that the opposition to the Bill will be so strong that nothing will come of it, which would be highly regrettable from the fire point of view. With a little "give-and-take," and a little tact in the latter direction, the promoters' wishes may, however, be met to a very considerable extent to their credit and to the benefit of the metropolis.



THE GADDESDEN PLACE FIRE: THE SCENE OF THE FATALITIES.

COUNTRY HOUSE FIRES.

THE country has been suffering from quite an epidemic of country-house fires during the past eighteen months. The fact that the buildings destroyed included several of high architectural and archæological value has at last also aroused public attention to this scandal, which is mainly due to the carelessness and indifference of the owners, whose very last thought is generally in the direction of fire protection, and who neither by personal interest nor expenditure—with some few rare exceptions—protect their families, their servants and their property from the consequences of a possible outbreak of fire.

We shall take an early opportunity to deal with the subject at some length, but would in the meantime warn householders against the ignorant, unreliable, so-called "inspectors" who seem to think that some little fire-brigade experience is all that is required to advise owners as to the necessary precautions they should take, and house agents who now venture to advise. It is better to take no advice at all, and be guided by common-sense alone, than to be stupidly lulled into a sense of security by incompetent and unreliable advisers.

We are particularly giving these words of caution in this supplement, as we have various circulars dealing with the matter before us, and in every case these circulars, on the face of them, show the charlatanism of the proposals made.

As illustrative of country-house fires we show two photographs of the one at Gaddesden Place. There the fire was followed by the sad deaths, recorded in the daily press, of the butler and footman whilst attending to the wine-cellar. The second photograph shows the actual scene of the fatalities, besides giving an idea of how completely the building was gutted.

THE SMALLER TESTING CHAMBERS OF THE FIRE PREVENTION COMMITTEE.

LONDON FIRE TESTS.

(By Our Special Commissioner.)

It is not often the fortune of a non-member to be able to attend the testing operations of the British Fire Prevention Committee, unless he happens to be a government, municipal or insurance official. The attendance at such tests is very strictly limited, the members only attending by rotation, and strangers—if they are not official representatives—being only quite exceptionally seen within the testing station grounds. Though perhaps not quite realized, there is always a considerable risk of accident at tests. The volume of flame is considerable and extremely gaseous, and the hazard of a falling wall or a gas explosion is considerable. This is evidenced by the fact that when issuing invitations the Committee does not hold itself responsible for injuries sustained by a visitor. No description, account or criticism of a test other than the duly authorized official report is allowed.

It was my privilege to attend the testing operations one afternoon this winter, with special permission to write about what I saw, provided that particular reference to the actual tests undertaken was avoided.

On arriving at the testing station situated in Porchester Road, Bayswater, some little time before the appointed hour, everything was in readiness for the day's programme. The site is secluded, having quite a narrow frontage to Porchester Road, and one of its boundaries abuts the Great Western Railway. Where there is a possibility of overlooking the site, the portions are screened by the erection of trellis-work about 30ft. high. The testing plant comprises three testing chambers, two back to back, measuring 10ft. by 10ft. in floor area, and one measuring 22ft. by 10ft. in floor area, the measurements being taken inside the walls. The necessary fire is produced by a large gas-producing plant (installed by Messrs. Mason, of Manchester), from which an 18in. pipe runs to the testing chambers, and from which gas is taken into these chambers by the aid of subsidiary pipes controlled by valves. The flame from these gas fires is of great intensity, occasionally streaming like a gigantic burner, but it also spreads from time to time, consuming its own smoke, and creating that volume of fire which is such a dangerous factor in actual conflagrations. The temperature of the fire is measured to a nicety with the aid of Robert-Austens pyrometers, pyrometer points being distributed in each testing chamber and the electric current carried by overhead wires to the instrument room.

No fire test would be complete without the very serious water test, for it is often the case that materials will stand quite a considerable amount of fire but at the veriest touch of water will disintegrate or collapse. This water test is obtained with the aid of a very neat small steam fire-engine.

The actual work of taking a record of what has happened during a test is generally entrusted to a special testing sub-committee, which is formed from among members of the Executive and members of the Committee. As a rule, at least one district surveyor is on the sub-committee, and then, according to the subject, either an architect or an engineer, and perhaps a fire-brigade officer or an insurance surveyor.

The gentlemen acting on this Testing Committee have various duties allocated to them, and the tests are conducted with remarkable smoothness; and as the temperature can be made to rise and fall by due working of the valves, &c., practically all the tests may be said to be on uniform lines as far as conditions are concerned. Say a testing operation is intended to involve a temperature of not less than 1,800 degs. at the finish, the temperature to rise gradually to that point, it will be seen time after time how, just at the close of the test, the temperature, which has been gradually rising, is brought to 1,820 degs. or, say, 1,850 degs. Fahr.

I noticed at the Test a very important Government official whose work brings him frequently in close touch with the question of fire and fire-prevention, the chairman of the Executive, a leading waterworks engineer, and about a dozen insurance surveyors and half a dozen district surveyors; also several architects well known as men of practical and constructive experience. Amongst the visitors were some of the leading members of the professional and volunteer fire service.

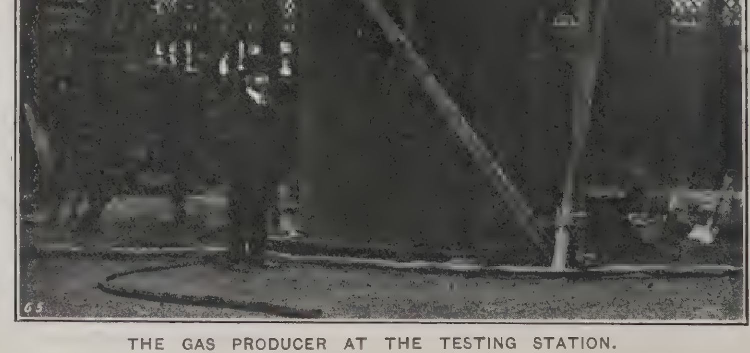
Obviously, occasional meetings on a common subject between men belonging to different though kindred professions must in itself mean a considerable interchange of knowledge and experience. In these instances the primary object is the unravelling of the truth relating to fire-resisting materials, and there is certainly no better subject for debate if one remembers the different aspects in which such materials have to be regarded.

The first test on the occasion here dealt with was a short one, the object being to attain classification as affording "temporary protection" only; the next test was a more ambitious one, when an attempt was being made by the owners to attain classification as affording "full protection"—a classification but very rarely obtained.

The firm whose goods were intended to afford temporary protection passed through their ordeal with flying colours. It was generally anticipated that they would withstand the ordeal of fire, for they had already been through several minor tests; but that they should have also brilliantly withstood a very severe ordeal of water—in this case applied directly at right angles and at about 45 lbs. pressure from a steam fire engine—came, I understand, as a surprise. This firm had submitted to no fewer than three tests on previous occasions, doing a little better each time.

It is to firms of this description that the tests must be of great importance. Although, perhaps, not quite successful at the outset, they learn what can be obtained by some small improvement, and gradually as the improvement is perfected the desired results are obtained.

The second test dealt with one for the "fully protective" class. It was a product presented by an old established firm of high technical standing. The material beat all



THE GAS PRODUCER AT THE TESTING STATION.

THE FINAL WATER TEST AFTER THE FIRE TEST.

records, as far as fire alone was concerned, and passed the ordeal necessary to get into the Committee's topmost classification, but during the second minute of the two minutes' water ordeal—through which the work has to pass—there was a collapse, and by about 45 seconds the makers missed their goal. Here again, however, the miss was entirely dependent upon the absence of some small improvements, with the aid of which the highest classification would have been obtained.

The third test was what are called the Committee's private tests, *i.e.*, they were a series of tests with sprinklers for the information of the members. Sprinklers of various types and kinds were being examined with a view to ascertaining what they would do in certain practical circumstances, and it was remarkable to see the variations and unexpected results.

The most striking lesson of the testing operations of the afternoon was the realization that a safeguard in matters of fire-resisting construction is only as strong as its weakest point, and that where there is a weak point it must be so strengthened as to meet actual requirements.

I have mentioned the danger attendant on these investigations, but as these tests are veritable clothes' wreckers of the first order, many a boot, coat and hat being irredeemably spoilt on such occasions, it cannot be an inexpensive matter for the workers and the members attending and helping in the test, none of whom receive any remuneration but have to bear all their own out-of pocket expenses as well.

Speaking generally, the whole of the work was pleasurable, and it is extremely carefully done, of an absolutely independent character and of enormous value both to tesfor and testee; for there is no doubt that whilst a successful test means business of considerable magnitude for the owners, the amount of instruction afforded at a test is also of considerable value to those attending the investigation.

I understand that testing stations of a similar kind have been already started in other countries. Some stations have become mere official institutions, others are particularly private ventures of insurance corporations, but the combination of the leading technical professions, architects, surveyors, and insurance surveyors taking up a matter jointly and handling it as it is done in the Metropolis, seems to me to ensure its independent character and to be of the greatest value.

London has been saved from the introduction of many a material and appliance, generally of foreign origin, which unscrupulous vendors have tried to foist upon a public without first ascertaining its merits through the work done at these testing stations.

A successful test should be the hall mark for a manufacturer. It can only be a matter of some few years before testing operations will be compulsory either by legal enactment or local by-laws, and the sooner this day comes the better. All praise, however, to the body of public-spirited men who at their own expense of both money and time are meanwhile guarding London against the dangers of fictitious so-called "fireproof" commodities being used in building construction.

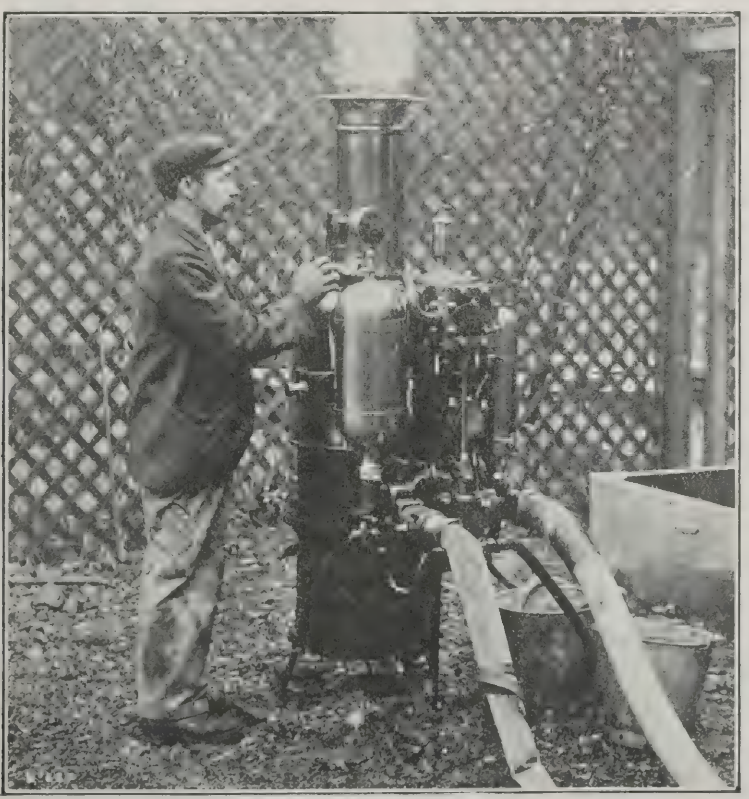
LOSS BY FIRE IN THE UNITED STATES AND CANADA.

THE following interesting particulars, taken from the "Times" commercial supplement, show the enormous fire waste on the North American Continent during 1904, and the general increase of waste during the last thirty years:—

The fire losses for the United States and Canada during the calendar year 1904 were greater than in any year since 1871, when the great destruction at Chicago made a record which can hardly be reached again. The waste from this source during the twelve months amounted to 252,364,050 dols. Included in this were three great fires—namely, those in Baltimore, Maryland, which caused a loss of 70,000,000 dols; in Rochester, New York, with a loss of 3,200,000 dols.; and in Toronto, with a loss of 12,500,000 dols. If one excludes these, the total of the small and moderate fires would still make a loss of 166,664,050 dols., of itself a large increase over the aggregate of 1903, and nearly 30,000,000 dols. beyond the average of the previous ten years. The following statement gives an idea, in a comprehensive form, of the destruction by fire on the North American Continent north of the Rio Grande river during the past thirty years:—

	Dols.
1904	252,364,050
1903	158,195,700
1902	149,260,850
1901	164,347,450
1900	163,362,250
1899	136,773,200
1898	119,650,500
1897	110,319,650
1896	115,655,500
1895	129,825,700
1894	128,246,400
1893	156,445,875
1892	151,516,600
1891	143,764,000
1890	108,993,700
1889	123,046,800
1888	110,885,600
1887	120,283,600
1886	104,924,700
1885	102,818,700
1884	110,008,600
1883	110,149,000
1882	84,505,000
1881	81,280,000
1880	74,643,400
1879	77,703,700
1878	64,315,900
1877	68,265,800
1876	64,630,600
1875	78,102,200

[Note: 5 dols. = £1.]



A PORTABLE STEAM FIRE ENGINE AT THE TESTING STATION.

NUREMBERG FIRE STATION.

THE new district fire station at Nuremberg, here illustrated, stands in its own grounds adjoining a small public park, and in close proximity are some municipal carpenters' workshops and smithies in which the majority of the men engaged at this fire-station are employed, for there is what is generally termed a retained brigade of municipal employees, the men following their ordinary trades for the municipality and turning out regularly to drills and fires. The building was completed about two years ago. It comprises a rather extensive block having a spacious and high ground floor, a very commodious first floor, and an exceedingly well arranged attic floor (utilized for stores) with a very cleverly arranged gymnasium in the roof. There is the usual hose tower, which can also be used for drill purposes. The architectural style of the building is that generally associated with modern Nurnberg, and is not displeasing to its surroundings. The engine-house proper on the ground floor has accommodation for three fire appliances, which comprise a chemical engine, an 80ft. long ladder and a hose trap, close behind which are the stables for the necessary six horses. Adjoining the engine-house is a reserve coach-house with a heavy steamer and a hose cart. On the ground floor also are a spare loose box, fodder store, room for coachman, and a watch room and a duty room. On the first floor there is a very large dormitory in which are quartered the men forming the crew of the fire station. It will be seen from the plan that there are beds for twenty-one men in this dormitory. In addition, a well-equipped day room with a billiard table, and a foremen's room, lavatories, bathrooms, &c., are provided on this floor. The details of the arrangements are explained by the references printed above the illustrations.

A Correction.—In the preceding Fire Supplement we indicated that apparently the fire-resisting curtain at the Crouch End Opera House was not of asbestos cloth. We have now examined some specimens of the cloth in question and find, however, that it is asbestos cloth, so that our original supposition was not correct.

THE NUREMBERG DISTRICT FIRE STATION: FIRST-FLOOR AND SECOND-FLOOR PLANS.

FIRE PROTECTION IN CENTRAL EUROPE.

ON p. 14 of the Fire Supplement included in our issue for November 23rd, 1904, we referred to the visit of the British delegates to the Budapesth Fire Congress and to various cities in Central Europe, and indicated that an official report was about to be issued by the British Fire Prevention Committee dealing with the journey of this special commission. The cities visited were Vienna, Budapesth, Munich, Nuremberg, Frankfort and Cologne.

We can recollect no occasion in which any special commission of this kind has dealt so exhaustively with questions of fire protection as practised abroad. In 1894 some notes were issued as to a journey not dissimilar to this one by a party of fire-service officers visiting Berlin and Vienna, and last year a souvenir of the visit of another party of fire-service officers to France was published; but nothing comparable with the record now before us has ever been published before in this country, nor can we find anything of the kind among foreign publications. The record is thus unique, as giving expression to the views of and technical notes by a commission thoroughly representative of our fire-preventive and national volunteer fire service, for the commission itself comprised not only the chairman and the two honorary secretaries of the Committee, but of three other delegates from the Committee and three further delegates from the National Fire Brigades' Union. Nearly all the commissioners occupy leading positions in their various specialist work, so that it is not only representative opinion, but exceedingly authoritative opinion, that is embodied in the record in question.

The record occupies about sixty pages quarto size, interspersed with about forty excellent illustrations. It comprises an introduction with a summary of the impressions obtained, followed by a diary of the journey, with copious annotations. The arrangement of this diary is particularly convenient for reference purposes. There is also an index of subject-matter. The record also has two appendices, one dealing with the general arrangements of the commission as to travel and programme, and the second relating to the Antwerp petroleum fire, which we have dealt with in a previous Supplement.

From the appendix dealing with the general arrangements one sees that the members of the commission each paid their own expenses, which figured at about £35 per head; that they travelled outwards and homewards over 2,000 miles, spent ten days in what we may describe as the work of the commission, four days in travelling and three days in well-deserved relaxation.

A very great portion of the report deals essentially with fire-service matters, but this, we think, will be somewhat outside the scope of our present article, and thus we only refer to this side of the question by giving the commission's general summary, which includes mention of fire-brigade work. This summary reads as follows:—

"From among the various impressions recorded above, the

THE NUREMBERG DISTRICT FIRE STATION.

following points might be said to be those which most impressed them selves on the mind of the members of the Commission as being particularly commendable :—

(*a*) The great attention paid to questions of technical detail in building legislation and control.

(*b*) The co-operation of the building control departments and fire brigades in the fire-survey systems.

(*c*) The general exits, stage drenchers, the substantial fire-resisting curtains, the numerous fire-call points, and the efficient fire-watchers in theatres.

(*d*) The high general state of efficiency in the country fire brigades, and usefulness of the national fire-brigade associations.

(*e*) The general high efficiency and splendid equipment of the professional fire brigades.

(*f*) The excellence of the mechanical long ladders.

(*g*) The great attention paid to auxiliaries by the professional fire service.

(*h*) The economic organization of a retained brigade of municipal employees under professional officers.

(*i*) The provision of ample water-supply under high-pressure, and the general introduction of standard hydrant posts.

(*k*) The high efficiency of the volunteer ambulance societies, and the excellence of their organization and equipment."

After the above summary we will now give, seriatim, the commission's impressions of fire prevention, theatre safety, and fire-survey matters in the cities visited.

Fire Prevention.

1. Architects, engineers and public officials were found generally to take more interest in questions of fire prevention than is the rule at home. They seem impressed with the necessity of systematic fire prevention for the public wealth.

2. The codes of general building regulations and special fire-prevention regulations were everywhere found to be of a very comprehensive character. In Bavaria and in the Rhenish cities visited the control of minute details appeared remarkable.

3. No limit seems to be placed upon the area and cubical extent of individual buildings, but buildings of more than ordinary size are subject to such precautionary measures in matters of detail as the separation of shop windows from the counters and gangways by fire-resisting materials, to prevent an outbreak of fire immediately involving disaster. Another such point of detail was the exact definition of the maximum distance from any point on a floor to the nearest staircase. Another was the suitable provision of electric fire-call points in large retail stores, and the provision of fixed iron scaling ladders to facilitate the rapid entrance of firemen to the upper storeys of this class of building. Again it was observed that in one of the retail stores all the iron doors in a divisional wall could be operated electrically from one point and closed simultaneously.

Theatres.

1. The whole problem of theatre safety seemed an essentially different one to that to which we are used in Great Britain, for, owing to the theatre being looked upon as the shrine of art that must have an isolated site, the question of planning with the view of obtaining rapid exit is simplified.

2. Further, owing to its being considered essential to have large ante-rooms and lounges to congregate in during the intervals of a performance, the whole difficulty of obtaining corridors and ante-rooms of sufficient width around the auditorium in the interests of safety are obviated. Speaking generally, exits and exit staircases were found to be excellent in all the theatres visited.

3. On the stage the precautions of reducing the amount of inflammable material by substituting metallic construction for wood construction was generally observed. But the rendering of scenery non-inflammable was only practised in one or two instances, and then only in a very perfunctory manner, without due regard to the necessity of impregnating the thin scantlings of the scenic framework.

4. Great reliance appears to be placed in stage sprinklers or drenchers, and no theatre was visited that had not a complete system of stage drenchers. There is no doubt that, if brought into action, these drenchers are highly efficient, but it is essential that they should be controllable from two points at least—one on the stage and one at a distance from the stage. The impression obtained from the actual working of the drenchers at Budapesth was thoroughly convincing as to their efficiency if promptly operated.

5. Everywhere the substantial fire-resisting

curtain of metal framing and metal surface was found, the latter frequently supplemented by a protective covering or a filling of a non-conductive character. The division of the auditorium from the stage by strong fire-resisting curtains was supplemented by similar divisions between the main stage and the so-called rear stage which generally served as an extensive scene dock.

6. Precautions were taken for limiting the use of open lights by applying electrical heaters in the dressing-rooms for making up, &c.; and considerable attention appeared to be given to such matters of detail.

7. The general neatness of the stage and the cleanliness of the stage offices, as also the general military precision of the working of the stage staff, called for remark.

8. A large number of electric fire-call points (frequently also automatic thermostat fire-alarms) were provided.

9. Strong theatre-fire watches were also provided by the brigades. In some cities there were permanent watches apart from the watches provided during the performance

Fire-Survey Work.

1. The senior local fire-brigade officers, both professional and volunteer, were everywhere consulted by the local authorities on all matters of fire prevention in buildings, passing of plans and the like.

2. At Munich the fire-brigade and building-control work was in the hands of one department and under one chief official, it being rightly considered that the correct economic management of the fire question was to have both the fire preventive and fire-brigade service in one hand, the fire-brigade service being supplementary to the fire-preventive service. This was, however, the exception, although there was some slight similarity in Vienna, where the municipal brigade practically ranks as portion of the surveyor's department.

3. Generally speaking, fire-brigade officers were very considerably utilized for fire survey in conjunction with the building-control departments, and are frequently called upon to make inspections, &c.

It would lead too far to go into detail regarding individual items from the technical notes, but we think it would be of general interest to indicate the style in which they are presented and at the same time give instances of other interesting information. Thus, on p. 33 of the Report we notice the following particulars in an annotation of the commission's visit to

The Hofburg Theatre at Vienna,

a splendid structure erected from the plans of the late Gottfried Semper and Baron Hasenauer:—

"This theatre was far and away the finest piece of theatre architecture seen *en route*. In plan, arrangement, design, decoration and equipment it is unrivalled. The exits seemed ample. It is, however, subject to a considerable risk of fire through antiquated electrical installation. The switch-room on the stage is one of the most dangerous the members of the party have seen. Besides being dangerous electrically, it is highly inflammable and lined with matchboarding. There was much unnecessary matchboarding and woodwork in the theatre. It appeared curious that such a building, on which such an immense sum of money had been spent, should contain defects so palpable that they are inexcusable. The staircase from the stage to the mezzanine was very antiquated and capable of much improvement. The stage was about 23 metres deep, namely, from the curtain to the back wall. There was an opening in the back wall on to a back stage, used to make the stage deeper for certain effects. Both this opening and the proscenium opening were fitted with iron curtains constructed of a framework covered with corrugated iron sheets. The stage was fitted below the gridiron floor with a system of pipes perforated at intervals, forming a sort of dry pipe sprinkler or "drencher" arrangement, it being possible to turn the water into the pipes at the stage-level but not, as far as could be learnt, from any other part of the house. The theatre has its own fire brigade. There were four tiers of "flies," but no water-pipes could be seen under these nor under the stage."

The Budapesth Opera House.

Again, dealing with another instance of the question of theatre safety, we find the following annotation in connection with the commission's inspection of the stage sprinklers at the Royal Opera House, Budapesth:—

"Perforated pipes, serving as dry pipe sprinklers, are fitted under the gridiron of the stage; the tanks for supplying same have a capacity of 90 cubic metres. If the whole of the sprinklers are turned on simultaneously the water in the tanks would last eighteen minutes. There are twenty-four hydrants in this building, always under a pressure from 2 to 2·75 atmospheres; this is indicated by water gauges. In case of emergency a higher pressure can be obtained off these hydrants by aid of two gas-motor driven pumps, which can increase the pressure up to about 7 atmospheres on ground and first floors and 5 atmospheres on the third tier. A remarkable display was given, the sprinklers being used with very good effect. Four deliveries were also brought into action from the stage; also three deliveries from the first fly galleries; also two from the second fly galleries, one hydrant being opened to serve each delivery. The pressure of water from all branches was exceedingly good. The stage was literally flooded out, so that no fire could have lived in this deluge."

The Cologne City Theatre.

To give a third instance on the point of theatres, we present the Committee's annotations on p. 61 when referring to the new Cologne Opera House, better known as the Municipal Theatre.

"This theatre, designed by Herr Moritz, who at the same time acted as contractor, has seating accommodation for 1,805, and is used as an opera house. It is exceptionally well planned and embraces all modern improvements. In conjunction with the theatre there is a large restaurant and concert garden, but this is practically detached. At the rear of the theatre there is a well-equipped scene store of considerable dimensions. The theatre is particularly well-equipped with telephones, call points and the like. The fire-call points are distributed one on either side of the stage and one on either side of the auditorium. In the respective corridors and on each level there are additional call-points besides, making sixty in all. The call-points are also utilized as electrical watchmen's control points. The stage is protected by a sprinkler system so arranged that it can be started in sections or as a whole. There is a reserve of water of 50 cubic metres in tanks at the top of the building. The fire-resisting curtain was operated from two points. The general impression from the fire point of view was that the exits were of more than ordinary excellence."

We would gladly go further in our annotations, taking up the references made in the report about retail stores, warehouses, &c., and last, but not least, the notes referring to some of the excellent fire stations which were visited.

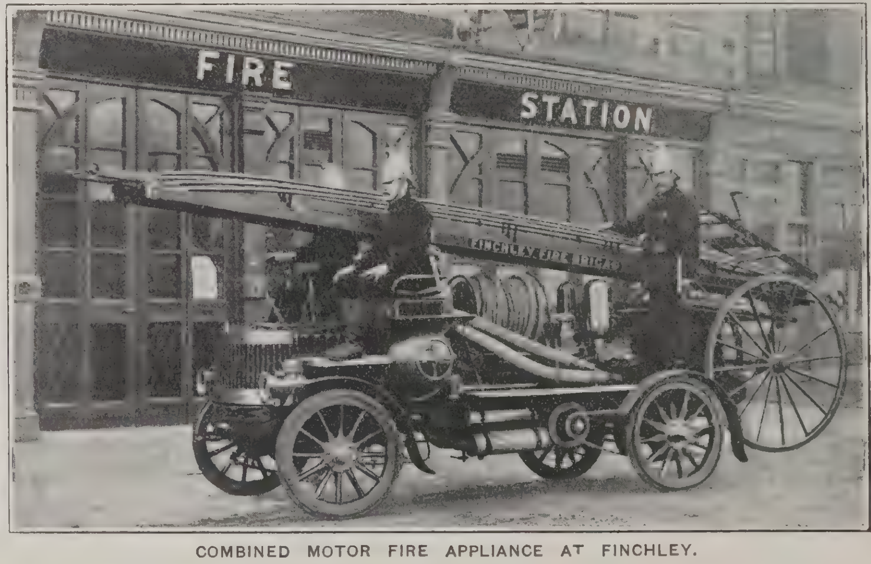
To indicate the character of the illustrations we present a photograph and two plans of the Nuremberg fire station, situated in that beautiful historical centre of South German arts and crafts. We think that both in plan and elevation the station in question well merits reproduction in these columns, and that Nuremberg is to be congratulated in having so excellent a building.

In conclusion we would express the hope that some of the impressions gained and the lessons learnt by the commissioners will find practical application in the British Isles, and that the report may have the attention of those who are in authority. We are glad to see that a certain number of the reports are to be put at the disposal of various official departments, and that also a considerable number will, *ipso facto*, go to chief officers of fire brigades.

"The Record of the Special Commission formed by the British Fire Prevention Committee to visit the cities of Central Europe, &c.," issued by the British Fire Prevention Committee, 1, Waterloo Place, London, S.W., price 5s.

COMBINED MOTOR FIRE APPLIANCE.

WE illustrate herewith an exceedingly useful appliance which has been provided for the Finchley Fire Brigade; the manufacturers are Messrs. Merryweather, Ltd. This appliance is practically a combined chemical engine, fire engine and fire escape, and is a self-propelled appliance. It is manned by a fireman or engineer and three firemen. It has a hose reel, broad side on, ready for instant use, and as a first-aid appliance it should be very practical. Although we are not, generally speaking, in favour of combining so many appliances on the same carriage, and would have preferred to have seen a larger tank of water carried, the appliance is, however, an enormous advance upon what we have been accustomed to prior to the International Fire Exhibition at Earl's Court, when chemical engines and combined appliances came before the public in a comprehensive way, and the Finchley Council and the makers are to be congratulated on the provision of an up-to-date equipment of an engine of this character.



COMBINED MOTOR FIRE APPLIANCE AT FINCHLEY.

Complete List of Contracts Open.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDERS MAY BE OBTAINED.
	BUILDING:		
Feb. 16	Abergavenny—Repairs to Cottages	—	Gas Manager, Gas Works, Abergavenny.
,, 16	Beaminster—School	Governors	R. Leigh, Beaminster.

Coming Events.

Wednesday, February 15.

Society of Arts.—Mr. Arthur Henry Anderson on "The Decline of the Country Town," at 8 p.m.

Royal Sanitary Institute. — Inspection and Demonstration at Islington at 2 p.m., conducted by Mr. James R. Leggatt.

Institute of Sanitary Engineers.—Election Committee, Examination and Literary Committee, Finance Committee and Organizing Committee, at 3 p.m. Mr. J. Thompson on "The Sanitation of Southend-on-Sea," at 7 p.m.

Institution of Civil Engineers.— Students' Visit to the "Underground" electricity generating station at Lot's Road, Chelsea, at 2.30 p.m. Dinner by Sir Guilford Molesworth, president, to the council and honorary members, at 8 p.m.

Architectural Association (Discussion Section). —Mr. James B. Fulton on "The Use of the Axial Line in Planning," at 7.30 p.m.

Edinburgh Architectural Association.—Rev. Prof. Cooper on "A Minister's Thoughts in regard to the Arrangement and Furnishing of a Parish Church," at 8 p.m.

Thursday, February 16.

Society of Architects.—Mr. S. R. Tucker on "The Lighting of Buildings by Electricity and Incandescent Gas," at 8 p.m.

Royal Academy.—Mr. Alfred Gilbert, R.A., on "Sculpture," at 4 p.m.

Friday, February 17.

Institution of Mechanical Engineers. — Adjourned discussion on the American visit, 1904. Prof. W. E. Lilly on "The Strength of Columns," at 8 p.m.

Northern Architectural Association (Students' Sketching Club).—Annual Gathering and Exhibition of Sketches and Drawings from 7.30 to 10.30 p.m.

Saturday, February 18.

Royal Sanitary Institute. — Inspection and Demonstration at Willesden Parish Infirmary at 3 p.m., conducted by Mr. Alfred Saxon Snell, F.R.I.B.A.

Edinburgh Architectural Association. — Dinner at 7 p.m.

Monday, February 20.

Royal Philosophical Society of Glasgow.— Mr. Robert Paterson on "The House as a Place to Live in," at 8 p.m.

Liverpool Architectural Society.—Mr. G. E. Thompson. Plates of "Architecture of Many Countries."

Royal Institute of British Architects.— Mr. Reginald Blomfield, M.A., A.R.A., on "Architectural Education," at 8 p.m.

Royal Academy.—Professor Aitchison, R.A., on "Vitruvius," at 4 p.m.

Tuesday, February 21.

Northern Architectural Association. — Students' meeting at 7 p.m. Annual General Meeting, Election of Committee, Discussion of Prize Essays.

Society of Arts.—Mr. Marion H. Spielmann, F.S.A., on "The Queen Victoria Memorial as compared with other Royal Memorials," at 8 p.m. (Mr. John Belcher, A.R.A., P.R.I.B.A., will preside.)

Wednesday, February 22.

Royal Sanitary Institute. — Inspection and Demonstration at Islington by Mr. James R. Leggatt, Supt., Public Health Dept., Islington, at 2 p.m.

Edinburgh Architectural Association.—Mr. Charles E. Elcock on "Through York with a Camera," at 8 p.m.

Thursday, February 23.

Leeds and Yorkshire Architectural Society. —Mr. Maurice B. Adams, F.R.I.B.A., on "More about Modern Libraries," at 6.30 p.m.

Royal Academy.—Professor Aitchison, R.A., on "Vitruvius," at 4 p.m.

Friday, February 24.

Glasgow Technical College Architectural Craftsmen's Society. — Mr. Colin Sinclair on "Steel Construction," at 8 p.m.

Architectural Association.—Mr. F. J. Osborne Smith, A.R.I.B.A., on "Country Houses and Accessory Buildings," at 7.30 p.m.

Saturday, February 25.

Royal Sanitary Institute. — Inspection and Demonstration at the Battersea Disinfecting Station, Mortuary and Shelter, by Dr. G. F. McCleary, at 2.15 p.m.

Builders' Foremen's Association.—Mr. F. M. H. Jones on "Slag-wool," Memorial Hall, Farringdon Street, E.C.

Bankruptcies.

[Abbreviations: R.O.—receiving order; P.E.—publi examination; C.C.—county court; O.R.—official receiver; Adj.—Adjudication.]

During the week ending February 10th twenty-nin failures in the building and timber trades in Englan and Wales were gazetted.

H. J. Harrop, builder, Lewisham. R.O. Jan. 31st.

A. E. Townsend, builder, London. Liabilities £2,540 estimated surplus assets £382.

F. Kemp, builder, Hove. Liabilities £1,941; asset £186.

W. Sanders, builder, Rottingdean. Liabilities £1,124 assets £276.

E. Jelly & Co., painters and decorators, Maidenhead P.E., Windsor Town Hall, March 4th, at 11.

W. H. Young, builder, Twyford. P.E., The Castle Winchester, Feb. 20th, at 11.

Collings Brothers, house decorators and electricians, Blackheath. R.O. Feb. 1st.

J. Sinclair, builder, Catford. P.E., Greenwich C.C. Feb. 28th, at 1.

J. Driver, plumber, glazier and gasfitter, Colne. R.O Feb. 2.

A. E. Harris, builder and contractor, Hounslow. R.O Feb. 1st.

J. T. Jones, plumber and glazier, Saltburn-by-the-Sea R.O. Feb. 3rd.

F. G. Powley, builder, King William Street, E.C R.O. Feb. 1st. First meeting, London Bankruptcy Cour Feb. 22nd, at 2.30. P.E., same, March 17th, at 11.30.

H. Harland, painter, contractor and plumber, Hanley First meeting, O.R.'s, Newcastle, Feb. 15th, at 11. P.E Hanley Town Hall, Feb. 22nd, at 10.30.

E. Spicer, builder, Mortlake. First meeting, 24, Rai way Approach, London Bridge, Feb. 17th, at 12.3 P.E., Wandsworth C.C., Feb. 23rd, at 12.

S. Flowitt, builder, Doncaster. First meeting, O.R.'s Sheffield, Feb. 15th, at 12. P.E., Sheffield C.C., Feb 23rd, at 2.

C. Stevenson, joiner and builder, Huddersfield. R.O Jan. 28th. First meeting, O.R.'s, Huddersfield, Feb. 16th at 3. P.E., Huddersfield C.C, March 13th, at 2.

W. Vickerman, contracting joiner, Hull. First mee ing, O.R.'s, Hull, Feb. 15th, at 11. P.E., Hull C.C Feb. 20th, at 2.

Munday & Co. (A. L. Kirkland), painters and decor tors, Southend-on-Sea. P.E., Chelmsford Shire Hal March 1st, at 10.

P. Fitzpatrick contractor, Hackney. R.O. Feb 2nd First meeting, London Bankruptcy Court, Feb. 16th, 12. P.E., same, March 16th, at 11.

THE

BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD.

February 22, 1904. Vol. 21, No. 524. 6, Great New Street, Fetter Lane, E.C.

Summary.

In the foundations for the new offices for the "Dundee Courier" reinforced concrete piles are used, laced together at the heads by reinforced concrete beams. Each pile is 28ft. long, 14ins. square and weighs over 2 tons. (Page 98.)

M. Rodin, speaking of modern architecture, says he sees nothing that gives encouragement. There are intelligent men sufficiently educated, who ferret out the style of Nineveh as well as the styles of Louis XIV. and Louis XV., but they only repeat, as parrots. "For long years we have done nothing but turn out from our colleges young men stuffed with useless scientific lumber; and they very quickly lose it all, and there is nothing to take its place." (Page 107.)

In forming the new tunnel on the Midland Railway at Alfreton it was not possible to work from the ends, so five shafts were sunk along the centre-line and the tunnel driven from each in both directions. There was no appreciable error in alignment, though only an ordinary 5in. transit theodolite was used for setting-out. (Page 105.)

Addressing students of the Birmingham Municipal School of Art, Mr. Edward S. Prior said that when the time came to erect a cathedral for the city why should they not build it as architect-masons and architect-carpenters, sculpture it as craft-sculptors, and decorate it as craft-painters, smiths, glaziers and tile-makers? (Page 106.)

The Building By-laws Reform Association has drawn up a new set of draft by-laws for rural districts, and also a Bill to exempt altogether certain buildings from the operation of by-laws other than those relating to sanitation. (Page 105.)

King's Cross used to be called Battle Bridge. (Page 106.)

There is a deadly list of petitions against the London Building Acts Amendment Bill. (Page 106.)

In a paper which he read before the Society of Architects last Thursday Mr. B. R. Tucker stated that for lighting a large room it was preferable to have a reasonable number of separate lights rather than one large light placed centrally. In open arc lamps the upper carbon burnt away at the rate of about 2ins. per hour. In enclosed arc lamps the consumption was much less, being only ⅛in. per hour, so that these lamps would burn for about 100 hours without re-trimming. The Nernst lamp had an average life of 300 to 400 hours, and was about three times as efficient as the ordinary incandescent electric lamp. Among incandescent gas burners the latest types were the "Lucas" and the "Khoma," the former giving 200-c.p. with a consumption of 6 cub. ft. of gas per hour and the latter giving 150-c.p. with 4 cub. ft. per hour. (Page 99.)

Acoustics. It is a surprising thing that such an important subject to the architect as acoustics should be generally ignored, and little or no attempt made to enquire into the matter. Until the last few years ventilation was another subject to which this same criticism might have applied, and even now the majority of architects seem to have no definite opinions as to the efficiency of different systems for various purposes. Engineers, too, seem bewildered. Maybe this is due to the intangible nature of air. Scientists have not yet solved the problems of aëronautics, and yet we must all feel that to continue in ignorance of the laws and nature of air—that substance we depend upon for our health and hearing—is somewhat of a disgrace. The books that are published on the subject of acoustics give little aid—they are generally filled with accounts of experiments and mathematical discussions of wave lengths, musical instruments, and the anatomy of the ear, hardly any attention being paid to the sound-effect due to the shape and construction of buildings. In his book Prof. T. Roger Smith, who took up the subject from an architect's point of view, gives numerous examples of actual buildings, but he performed few experiments. His analysis of the facts was therefore superficial, and he thought the shape and size was all-important. But when examples were erected correctly proportioned as to rigid numerical ratios, even to details, the results were wholly unexpected. Even compartments duplicating the shape of others good acoustically, were found to be bad. Naturally the conclusion was come to by the few who chose to investigate it that the materials of which the buildings were constructed had their importance. Prof. W. C. Sabine in the United States has recently investigated the subject and proved from a number of experiments that materials possess the power of absorption in varying degrees, and that the shape makes little difference. From the fact that sound is energy, this should have been apparent to any scientist at first, but one is always wise after the event. It has now been established that the duration of sound in a compartment depends upon two factors: the volume of the contained air and the absorptive capacity of the materials of its structure and contents. Each time waves of sound are reflected from a surface, part of their energy is absorbed, and the duration of a sound depends upon the speed with which it is absorbed. In a long building with particularly non-absorptive materials the sound is so loud when reflected, and takes so long to travel, that when it arrives back it produces an echo. If this does not happen, then the residual sound blurs hearing; a certain residual amount is of advantage in a music room as it diminishes the staccato character of successive notes.

To Control London Street Architecture. Sir William Richmond's proposal that the London County Council should appoint a special committee "to advise the Council upon all proposals involving permanent or constructive work, or designs in the selection of which artistic knowledge and taste are requisite," is a praiseworthy effort to get a fixed policy in regard to artistic matters adopted by one at least of the authorities that be. Parliament has often been asked to appoint a Minister of Fine Arts, and to encourage the arts in England as they are encouraged in France, but has been unencouraging (in fact, hardly interested) and sometimes hostile and philistine. The London County Council has been more progressive in this respect, and the appointment of Sir William Richmond as an alderman was a recent instance of its appreciation of the importance of art in the enlightenment of the public and the betterment of their surroundings—of its utilitarian value in the truest sense of the word. If the Council will but lead the way in appointing such a body as proposed by Sir William Richmond it will establish a precedent that may eventually produce some real improvement in our public monuments and streets and, by reflection, in the design of private buildings. The following names are proposed for the committee—The presidents of the Royal Academy, the Royal Institute of British Architects, the Society of Antiquaries and the Institution of Civil Engineers; two sculptors, Mr. Brock, R.A., and Mr. Frampton, R.A.; two architects, Mr. Jackson, R.A., and Mr. Reginald Blomfield, A.R.A.; one painter, Sir Lawrence Alma-Tadema, R.A.; the Earl of Carlisle, Lord Windsor and Lord Balcarres. These names we do not quarrel with; we would only suggest the addition of the president of the Surveyors' Institution, Prof. W. R. Lethaby (as one of the Council's present art advisers and examiners, and head of their Arts and Crafts School in Regent Street) and Mr. Beresford Pite as professor of architecture at South Kensington. If such a body were to have submitted to them all the drawings of proposed buildings in London put before the Building Act Committee and to privately submit their suggestions to the architects as friendly comment, it would be a great advantage.

VIEW SHOWING COMPLETED PILES AND OTHERS IN MOULDS.

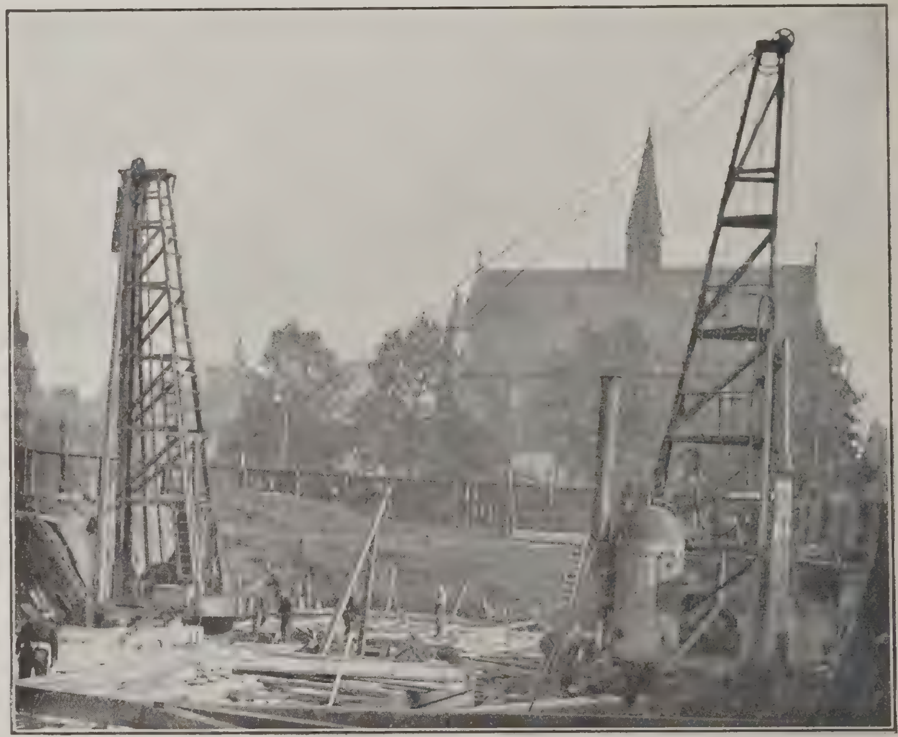
FOUNDATION WORK IN REINFORCED CONCRETE.

A MOST interesting example of reinforced-concrete construction, on the Hennebique system, is afforded by the large block of new premises now being erected for the Dundee "Courier" from designs by Messrs. Niven & Wigglesworth, architects, of 104, High Holborn, London, W.C. It is not possible for us to give a perspective of the building at present, but through the courtesy of the proprietors of the "Courier" we are able to reproduce a number of photographs showing the work in progress. Before proceeding to deal with this in detail we may state that the building will be seven storeys high (including basement and Mansard) and will have walls of stone from Dumfriesshire quarries. It is Renaissance in style and presents a very fine front to Meadowside. The counting-house and advertisement department will be on the street level, editorial departments on intermediate floors, and the composing-room at the top. The printing machines will not be in the main structure, but in a separate building in Euclid Crescent. The site is probably the finest in Dundee. It was formerly partly occupied by the old post-office; opposite is the Albert Institute (designed by Sir G. Gilbert Scott), containing the art galleries and the Dundee free library; to the north is the Classic front of the High School, with the Royal Exchange adjoining; and to the south Reform Street, with Lamb's Hotel, the National Bank of Scotland, the Bank of Scotland, and, at the further end, the Townhouse and city offices. The total cost of site and buildings will be about £60,000.

Work was commenced last summer, the contractor being Mr. Thomas C. Stocks, of Dundee. To secure a good foundation a large number of reinforced-concrete piles have been driven, and on them is formed a box basement, with retaining walls of concrete.

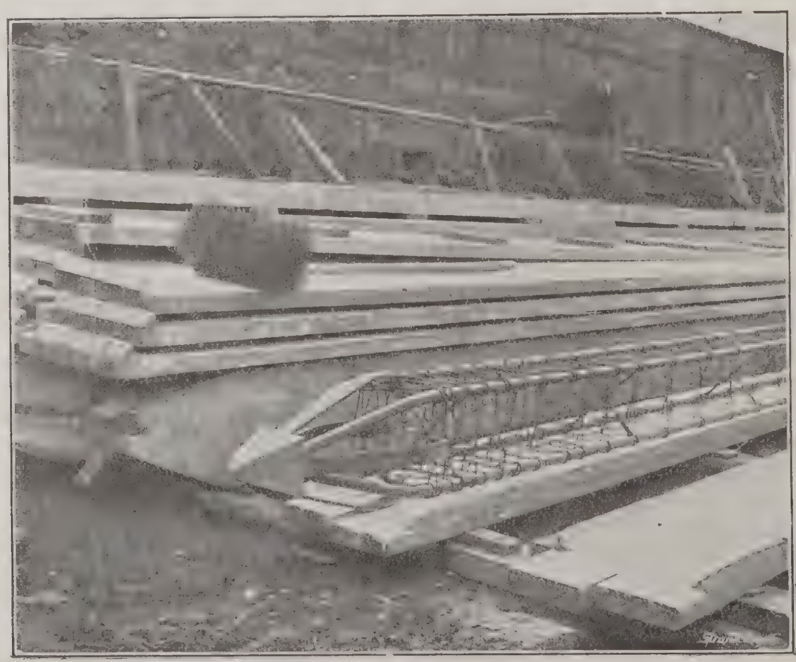
The piles are built up with a square framework of $1\frac{1}{8}$in. steel rods attached to a shoe at the base and laced with smaller steel rods. This skeleton is lifted into a box and tightly packed around with concrete, the material being driven in with rammers. When the concrete has set, the sides of the box are taken down, disclosing a pile 28ft. long, 14ins. square and weighing over 2 tons. The specification for the ordinary reinforced concrete states the proportions to be:—Gravel (free of sand) of all sizes between $\frac{1}{8}$in. and $\frac{3}{4}$in., 27 cub. ft. (gravel of one uniform size to be carefully avoided); sand $13\frac{1}{2}$ cub. ft.; cement 6 cwts. For the piles the proportions are:—Gravel 27 cub. ft., sand $13\frac{1}{2}$ cub. ft., cement $7\frac{1}{4}$ cwts. This mixture when in place and properly rammed yields a volume of concrete of 31 cub. ft. The pile-drivers carry "monkeys" weighing 2 tons each, and the drives are made at the rate of thirty per minute. To prevent the concrete being smashed, the pile is crowned with a cast-iron "helmet" fitted with a block, or "dolly," of elm, which softens the impact.

The piles are not sunk indiscriminately but grouped together at the points where the weight of the building will be received. They are mostly placed in groups of five, and the first pile of a set generally drives to nearly its entire length; but as the soil becomes consolidated the resistance increases, and the last of the five never drives to full depth. All, however, are finished off at ground level, the concrete being chipped through and the steel rods sawn across about a foot above ground. Transverse rods are then laid from one pile head to the next, and these in turn are sheathed in concrete, so that in effect all the piles are laced together by massive beams of reinforced concrete. Upon these a floor of such concrete, 7ins. thick, is laid. The piling, it must be understood, is carried on at what would in ordinary cases be foundation level, about 11ft. below the street. Each pile is capable of carrying 175 tons, but no single one will require to take more than 50 tons, the approximate weight of the building being about 6,000 tons.



PILE DRIVERS.

Retaining walls of reinforced concrete are built up to the level of the street, and about 3ft. within these are being erected the piers which will carry the super-structure. Over each set of five piles one of the piers is placed, the steel rods which form the core of the piles being linked to similar rods which run through the piers, so that the whole is homogeneous. Over the smaller groups of three piles, piers less massive are built to support the floors; at street level these being also connected with reinforced-concrete beams, on which the first or street floor (of reinforced concrete 4ins. thick) is laid.



SKELETON FRAMEWORK OF REINFORCED CONCRETE PILE.

The piers are larger in area than the piles upon which they rest, and therefore upon the heads of the piles a kind of reinforced concrete bracket-capital is formed. The basement is to be lighted by pavement lights (the piers being set back within the retaining walls for this reason) and by stallboard lights, bulkheads being formed in concrete where these latter occur (see p. 102). The retaining walls have piers at intervals, with horizontal beams between half-way up the height, so as to give stiffness. The clerk of works on the job sends to the architects each week a report on the progress of the work, with the number of men employed, visitors, &c. We give below the report for the week ending Saturday, February 11th, to show its character :—

RETURN OF WORKS EXECUTED AT "COURIER" NEW OFFICES, DUNDEE.
Report No. 36, for Week ending Saturday, February 11th, 1905.

Workmen employed.	Mon.	Tues.	Wed.	Thur.	Fri.	Sat.	Occupation of Workmen.
Bricklayers							Carpenters are engaged on preparation of ferro-concrete centering. Masons are at work on hewing for first floor and polishing work for ground floor. Wallers are fixing hewn work on Albert Square and Meadowside elevations. Labourers are engaged on site in connection with walling and masonry. Plasterers are filling up holes in basement ceilings and rendering and making good walls in basement. Smiths are preparing steel for ground-floor beams. General labourers are engaged clearing up basement floor, on ballast crushing, forming beams at south end of ground floor, and laying floor at this end. Carpenters are forming circular faced beam at staircase bay and finishing centering at south end of ground floor.

State of the Works and Materials on Ground.	Questions to be Asked and Drawings Required.
The first two arches on Meadowside elevation, north end, are complete ; the third pier on same elevation is four courses above base course. The two piers on Albert Square elevation are at the height of springing-stone, and corner pier on Euclid Crescent and Albert Square is at ground-floor level. The hewn work for first floor is well in hand. The power wires to motor for crane are fixed, but current is not yet on. The beams are all formed in ferro-concrete at south end of ground floor, retaining wall against old gable is up, and a portion of the floor laid. The centering for circular faced beam on staircase bay is prepared. The making-good of holes in ceiling of basement is partly done, and end wall, Albert Square, is rendered and floated. There is trouble keeping out the water in sunk portion under staircase, and it may be that a portion of the concrete must come up yet.	

DRIVING IN A PILE.

THE SOCIETY OF ARCHITECTS.

Lighting by Electricity and Gas.

AT last Thursday's meeting of the Society of Architects a paper on the lighting of buildings, &c., by electricity and incandescent gas was read by Mr. B. R. Tucker (member of the council of the Society, member of the Royal Sanitary Institute, and late chief surveyor, War Office). After some introductory remarks Mr. Tucker said that the average amount of light required for reading and writing might be taken at 1 candle-foot ; this, however, depended on the nature and extent of the reflecting surfaces influencing the light ; for work with much detail, or on coloured materials, not less than 5 candle-feet should be provided. The general legal standard of light was the standard candle—a spermaceti candle of certain dimensions, weighing one-sixth of a pound avoirdupois and burning 120 grains per hour. From this a standard of light was obtained which, at a distance of 1ft. from the object illuminated, produced an illumination equal to 1 candle-foot or, as generally expressed, "1 candle-power." At other distances the illuminating power was determined by the "law of inverse squares," which stated that the intensity of light varied inversely as the square of the distance ; thus at 2ft. the intensity was reduced to one-fourth of that at 1ft., the same rays of light having to cover four times the area. The measurement of the light was made by a photometer, the principles of which depended on the law of inverse squares. This law proved that to obtain the best result with economy in lighting it was necessary in the case of a large room or building that it should have a reasonable number of separate lights judiciously distributed, instead of a large single light or lights placed centrally in it. The lights should be of such a nature and so placed as to produce a minimum illumination of, say, about 1 candle-foot at the parts farthest from the light. The best light was a soft well-diffused one, usually obtained by employing ground glass globes, &c.

Of electric lamps there were three kinds—arc lamps, Nernst lamps and incandescent lamps. Arc lamps were of two kinds—open and enclosed.

The Open Arc Lamp

was the most intense artificial illuminant, its light being produced by sending a continuous or alternating current between two slightly separated carbon rods. In an ordinary arc lamp the upper carbon was the *positive*, fed slowly downwards by solenoid mechanism as fast as it was consumed. At its lower end this carbon fairly boiled away into vapour, producing a slight hollow in the centre of the end known as the "crater." The lower carbon, or *negative*, was evenly and somewhat sharply pointed—if the arc was short, particles of carbon were torn off from the surface of the crater in the upper carbon and many of them were deposited on the lower carbon. With a direct current the upper carbon would burn away twice as fast as the lower (if of the same diameter), generally at the rate of about 2ins. per hour. The carbons were usually of $\frac{1}{3}$in. diameter, and the upper (and sometimes the lower also) had a soft core of carbon in the centre about $\frac{1}{16}$in. diameter ; this portion more easily fused and produced a greater mass of carbon vapour, which tended to hold the arc centrally between the carbons. The rays of light from this lamp came chiefly from the "crater," and fell at an angle of 40 degs. below the horizontal.

The Enclosed Arc Lamp

had its arc enclosed within a globe which practically excluded the air. The ends of the carbons kept fairly flat, the arc filling only a portion of the space between the

PILE DRIVER, AND BEAMS INTERLACING REINFORCED CONCRETE PILES.

carbons and travelling slowly from one part to the other. The carbons in this lamp were consumed only at the rate of $\frac{1}{8}$in. per hour, so that they would burn from 80 to 120 hours or more without retrimming. The arc was much longer, and the downward obstruction of the light by the lower carbon was greatly reduced. The advantages of this lamp consisted in the saving in the cost of carbons and the saving of labour in retrimming, while the inner globe—being often of opal glass—ensured a better diffusion of light. The lamp also gave a much rounder and fuller distribution of light; and although, with the same energy, the minimum light was only a little more than half that of the open arc, yet the better distribution of light fully compensated for the difference. For interior lighting the outer globes were sometimes of opal or ground glass, so that the bluish tinge produced by a long arc was partially eliminated. Several enclosed arc lamps were now in use fitted with one globe only, and were giving greater satisfaction than those having two globes, as they afforded a greater and better diffusion of light. Opal globes absorbed from 50 to 60 per cent. of the light, ground glass (according to its density) from 30 to 50 per cent., and clear glass about 10 per cent. Arc lamps of the inverted type were often used in studios, factories, &c., the rays being thrown on a white ceiling, whence they were reflected, producing a most pleasing effect.

The Nernst Lamp

came between the arc lamp and the incandescent lamp. The light was obtained by making incandescent a filament of mixed oxides, generally from 1in. to 1½ins. in length and placed either horizontally or vertically. The filament when cold was a low conductor, but when heated by a coil around it became a better conductor, and then was made vividly incandescent. This filament could not be run without a resistance, which was necessary to prevent the light becoming unstable. The filament being incombustible, it was not necessary to place it in vacuum, as with the incandescent lamp. The lighting of the Nernst lamp occupied a short time, and no doubt that was one of its drawbacks, together with the frequent breakdown of the filament and heating coil, owing to vibration. The average life of the burner was from 300 to 400 hours. The efficiency of the lamp was extremely high, being ·95 watts per c.p. on a 100-volt circuit and ·88 watts on high-voltage circuits. A 1-ampere lamp would give 105-c.p. on a 100-volt circuit and 250-c.p. on a 220-volt circuit, this being practically three times the amount of light given by the ordinary incandescent lamp consuming the same amount of current.

The Incandescent Electric Lamp

in general use consisted of a carbon filament possessing a high resistance and of sufficient strength to ensure a fair life. Except those for special lamps of great candle-power, the filaments were made of soluble cellulose threads, hardened, carbonized and "treated."

Other things being equal, the life of the lamp practically depended on the temperature employed. There was a steady disintegration and vaporization of the filament during incandescence, producing a decided increase in the resistance, and a consequent decrease of current, temperature and light. An ordinary low-efficiency 100-volt 16-c.p. lamp took about ·6 amperes; at 200 volts about ·3 amperes, and at 250 volts about ·24 amperes. Lamps could be obtained of three classes—low, medium and high efficiency, absorbing respectively from 2½ to 4 watts per candle-power. On the whole, the best result was obtained by using lamps requiring 3 to 3·5 watts per candle-power. Practically, the Board of Trade unit was equal to the current required for No. 16—16 candle-lamps per hour. The rate per

CONSTRUCTING THE BEAMS INTERLACING THE HEADS OF REINFORCED CONCRETE PILES.

AT WORK ON ONE OF THE RETAINING WALLS.

unit for electrical current in the City of London varied from 2½d. to 5d. In one business house 2½d. was charged per unit for current used in the day-time in the basement, 3½d. for that used on the ground floor, and 4½d. for the floors above.

Incandescent Gas Light.

Turning to this light, Mr. Tucker said it was the result of two important discoveries, namely, the Bunsen burner and the incandescent mantle. About fifty years ago Bunsen invented the atmospheric burner which bore his name. By this a non-luminous gas flame was produced by mixing coal gas with a certain proportion of air, the proportion being generally about 1 to 5 or 6. The discovery of Baron von Welsbach, in 1886, led to the production of a mantle of refractory oxides, having as a base that wonderful and rare earth or oxide of the metal thorium, known as thorea; while the further and more wonderful discovery in 1891-1892 of the power exerted upon thorea by having a trace of ceria mixed with it led to the production of the marvellous intensity of light which these mantles produced. The exact proportion was found after many careful experiments to be 99 per cent. of thorium and 1 per cent. of cerium. It was still necessary to resort to further research before we could fully understand how it was that the incandescent mantle could produce light equal to 18 candles per cub. ft. of gas consumed; whereas when we used the gas in the ordinary way, in producing a flat or other flame we obtained only about 3 candles per cub. ft. of gas consumed.

The efficiency of the mantle at the first start with the "C" burner was equal to 15 candles per cub. ft. of gas consumed. It diminished with the age of the mantle. The incandescent "C" burner was

6 times as efficient as an ordinary gas burner.
5 ,, ,, ,, Argand do.
3 ,, ,, ,, regenerative do.

Notwithstanding the considerable improvement made in the mantles of late years, it was stated that to see incandescent gas lighting to perfection one needed to go to Berlin. In that city the mantles were used without any coating to protect them in transit, the burning off of which when first lighted caused a certain amount of deterioration and loss of incandescence. Mantles should not be kept in stock for any length of time, as they became deteriorated by the action of the oxygen in the air. By-pass burners should be used; the by-pass only consumed 1ft. per twenty-four hours.

FORMING GROUND FLOOR ON THE CENTERING.
The stirrups to be seen are in the main beams carrying the floor.

The convenience of being able to light and extinguish gas burners at any one point at a distance away, as with electric light, was well recognized, and the Pneumatic Gas Lighting Co. and others had invented apparatuses for this purpose.

Natural ventilation was much improved by the use of incandescent gas lighting, the heat of the burners not only causing a healthful circulation of the air, but materially assisting to remove the vitiated air in all cases where proper provision had been made for its escape: in which connection Mr. Tucker cited the experiments carried out in the Birmingham Museum and Art Gallery in 1902, and reported upon by Prof. Percy F. Frankland, of Birmingham University; these experiments showing that—

(*a*) in the absence of any artificial illumination, there was a slight increase in the percentage of carbonic acid in the air during the course of the day;

(*b*) with the electric arc lamp illumination, the increase in the percentage of carbonic acid was distinctly more marked; while

(*c*) with the incandescent gas illumination there was a distinct diminution in the percentage of carbonic acid in the air.

The explanation of this diminution was not far to seek, it being obviously due to the more efficient ventilation of the gallery caused by the greater draught of heated air through the ventilating shafts placed above

VIEW SHOWING BASEMENT FLOOR AND CENTERING FOR GROUND FLOOR.

FORMING BULKHEADS ADMITTING LIGHT TO BASEMENT.

the incandescent gas burners. The circumstance that the percentage of carbonic acid actually diminished during the use of the incandescent gas burners proved that the products of combustion, from which damage to the pictures might be apprehended, was completely carried off by the ventilation, so much promoted by the gas-burners.

In the opinion of Professor Frankland the incandescent gas installation in the Art Gallery was preferable to electric arc lamps, for although these lamps did not give rise to sulphur compounds they generated ozone and oxides of nitrogen, which were calculated to act prejudicially on pictures.

The Lucas Lamp

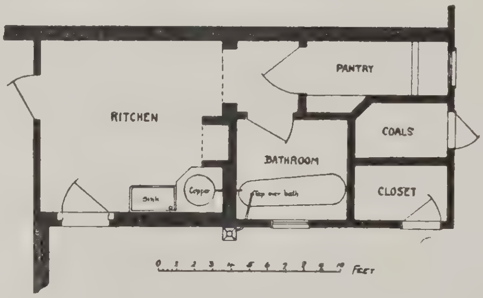
was a very good example of the latest type of incandescent gas lamp. Its special advantage was that it did not require any compressing plant or machinery to raise the pressure of the gas (as required by the usual type of high-pressure burner), each lamp being self-contained and constructed to work with the ordinary pressure of gas. The lamp was of simple construction, with no working parts to get out of order. It comprised a Bunsen burner of large diameter fitted with a special kind of regulating nipple for adjusting the supply of gas, a short glass chimney or globe, and an elongated metal cylinder or chimney. The proportion of gas and air burnt was about 5½ volumes of air to 1 of gas, this being the most powerful explosive mixture obtainable with coal-gas, and producing the highest possible flame temperature; 39 cub. ft. of this mixture consumed in the Lucas lamp per hour would produce an intensity of light equal to 200 standard candles. The lamps were made in four sizes, with consumptions of gas as follows:—

200 candle-power	6 cub. ft. of gas per hour.
400 ,, ,, ...	10 ,, ,,
700 ,, ,, ...	17½ ,, ,,
1000 ,, ,, ...	24 ,, ,,

The lamps could be lighted by a special by-pass arrangement enabling a series to be operated from a distance and switched on and off as rapidly and as easily as electric light. The essential principle of the lamp was the proportion and combination of the glass and metal cylinder above the mantle, and the enlarged Bunsen tube, through which all the air required for perfect combustion was drawn.

The Khoma Lamp.

This was an incandescent gas lamp on the regenerative principle, by which the gas was superheated in a chamber before it passed to the burner. The chamber for heating the gas was placed directly above the mantle, well within the heating zone. This ensured the thorough superheating of the gas, in which state it mixed better with the air in the Bunsen burner. By the heating of the gas the lamp developed from 20 to 25 per cent. more light, as complete combustion was more nearly obtained. No chimney was used, so that there was no obstruction of light and no breakages could occur. For outside use the lamp had a wind-proof shield in the form of a copper cylinder to protect the mantles during renewal or while the lamp was being cleaned. The consumption of gas was about 4 cub. ft. per hour per burner, producing 150-c.p. per burner. A lamp might be fitted with a cluster of burners, but four burners were equal to 600-c.p.



COTTAGES WITH BATHROOMS.

THE above plan of a back addition has been drawn out by Mr. W. H. Death, builder and decorator, of Ipswich, who proposes to register it. Several cottages have been built in accordance with it, and the tenants are much pleased with them. Mr. Death says he receives a rent of 6s. 9d. per week (clear of rates and taxes) for some with six rooms, half hall and bay window, and 5s. 3d. for others without hall and bay. He estimates the extra cost of building the bathroom (with bath, p.c. 35s.) from £6 10s. to £7 10s. He has built ten for the Ipswich and Suffolk Freehold Land Society and four for himself. There is a water tap fixed over the copper (supplied from the main), and the tap over the bath is connected to the copper by galvanized iron pipe with a back nut inside and outside the copper near the bottom; as the pipe is always full of water the fire does not harm it. The waste-pipe is taken through the wall and discharges over a gulley outside. The bath can be used for washing linen.

Correspondence.

Buttresses.

To the Editor of THE BUILDERS' JOURNAL.
LONDON, W.

SIR,—Referring to the correspondence on this subject which has appeared in your Journal, perhaps you will allow me to make a few observations, since it was the publication of my design that caused the discussion. Neither of the suppositions which your delightfully sarcastic correspondent suggests is the correct reason why the ingle-nook is shown "well shored up at the angles," although, I had, I consider, justifiable reasons for placing buttresses there. The ingle-nook was an addition (the fireplace originally being situated on the opposite wall), and in the detail drawings the walls were made considerably thinner than the main ones for the sake of economy, but through a mistake in the tracing they are shown about the same thickness. If I had been so very anxious to employ buttresses in the design without having any idea of their being of some constructive value, I might have placed them at the other angles of the house, and a few more in between as well! But where thin walls are used rendered with rough-cast to keep out the damp, these buttresses are useful as strengtheners at the angles when there are hipped roofs, and often elsewhere. Even though they do not always take a *direct* thrust, as, of course, was their original use in Gothic work, they at least add considerably to the strength of a building whose walls, either for economy or otherwise, are built thin, and surely it is not such a very "repulsive" method of giving this extra strength.

Too much strength, as you say, may be "bad art," but it is infinitely "better art" than too little. It is amusing to read your crushing remarks about the innocent buttress because it does not *absolutely* take a direct thrust, when in the modern steel-framed buildings—apparently the architecture of the future—the whole structure is a sham!

Some of our best architects occasionally adopt these buttresses in their country-house designs, *not* merely for the "pleasing effect" they give—as one would imply from your sweeping statements about "bad art," "not knowing what architecture is," and the like. If all buildings are to be condemned because they possess some ornamental feature which is not absolutely essential, then very few will bear inspection.

A buttress here and there is not going to do architecture much harm, even when they may be used for other reasons than to take a thrust from a vaulted roof. At any rate, their adoption is not so opposed to the principles of architecture as the modern very clever system of sticking stonework and terra-cotta on to a steel frame and carrying five and six storeys on (apparently) thin wooden tracery and plate-glass.

This system presents a real danger to our future architecture, whereas over-supporting and strengthening is hardly a very serious fault.—Yours truly, E. G. WALKER.

[The above letter reminds us of that Irish solicitor who said he would first bring evidence to prove his client did not steal the goods, and then, if that did not satisfy the magistrate, he would bring evidence to prove that if he did steal them, there was every excuse for his doing so. Moreover, our correspondent writes as though we had been eulogizing the American system of hanging stonework on to steel, and tries to add point to his argument by inferring something which we never inferred. But he cannot gainsay the fact that there has latterly been a mild fever for sticking on useless buttresses, and it was against that stupid practice that our remarks were directed. It seems we need to repeat that a buttress must not be confused with a pier.—ED. B.J.]

R.I.B.A.

Mr. Reginald Blomfield on Architectural Education.

A MEETING of the Royal Institute of British Architects was held on Monday evening, the chair being occupied by the president, Mr. John Belcher, A.R.A.

The decease of Mr. James Barnet, Fellow, of Sydney, N.S.W., and Mr. James Thomson, Fellow, of Glasgow, was announced.

Mr. Reginald Blomfield, A.R.A., then read a paper on "Architectural Education."

The author said that the subject of architectural education had long engaged the attention of all thoughtful architects. Notwithstanding the increasing tendency to develop school training, and the improvements that had been made in it, the pupilage system had, in the main, held the field. No successful attempt had been made to bring it into relation with the schools and to coördinate the various methods of training in use in the latter. It was highly important that a pupil, before entering an architect's office, should have gone through such preliminary training in the schools as would enable him to get his bearings in the office without waste of time. Hence they had to consider how the student should be started in his course of architectural training, what subjects he should study, and how they should be taught. To arrive at clear ideas on this matter it was necessary to define what was wanted in an architect.

Architecture is the art that translates construction into beautiful forms; the architect, therefore, must master the principles and methods of construction before he can translate them. His real technique consists of the mastery of building processes: these are the true vehicle for the expression of his imagination. Another highly important matter is the possibilities of new methods of construction. Steel and iron render possible feats of construction which, on economic grounds alone, are irresistible; and it is the architects' business, as artists of form, to study steel and ironwork in order to develop out of its practical use methods of construction which have a beauty of their own in their adaptation of means to ends. The architect's training ought to enable him to take this matter up where the engineer is compelled to leave it through want of training in form and lack of artistic imagination.

Dealing with the unsatisfactory condition of architectural education, the author summarized the chief defects of the present system of schools as (1) faults of syllabus, (2) faults of teaching method, and (3) the absence of coördination, resulting in waste of resources and loss of driving power. Two years ago some informal conferences of architects were held to discuss the situation; and finally, at the invitation of the Royal Institute of British Architects, a Board of Architectural Education was formed to consider the whole matter. The conclusions arrived at by the Board were embodied in a report which, together with a syllabus, had been provisionally adopted. Five points were dealt with, viz.:—(1) Preliminary education, (2) the length of proposed course, (3) the syllabus of training, (4) the laboratory or workshop for training in practical work, (5) the steps to be taken to initiate and administer the scheme.

As regards (1) preliminary education, it is a difficult matter to assess the exact amount of general education necessary to an intending student of architecture. A student may have great natural aptitude for architecture, but little aptitude or little opportunity of acquiring the knowledge usually given by a good general education. The Board consider it best not to impose any preliminary test for admission to the architectural course, but to leave it to the individual training institutions themselves to lay down the amount of preliminary education they severally consider desirable. The Board, however, consider that evidence should be shown of some capacity in drawing, both geometrical and freehand.

(2) For the length of the proposed course, the Board recommend four years as a minimum—the first two years to be spent in the schools, the last two in an architect's office. The object of this is twofold: first, to enable the student to master his rudiments in the schools in order that when he enters the architect's office he may know how to learn and get the full advantage of his opportunities in the office; secondly, that in view of the pupil being partially trained, architects may be disposed to take pupils at a lower premium, and parents and guardians may not be put to a greater expense than they are under the present pupilage system. The pupil should continue his studies in the schools during his term in an architect's office. The preliminary course must of necessity be rudimentary, and should be supplemented by more advanced studies under his old teachers during his last two years. His studies will thus be pursued on a consecutive system, and under competent supervision from first to last. It is suggested that on the completion of the course a certificate should be granted to the student in consideration of satisfactory progress and capacity as proved by his work in the schools, and by a study of some architectural project, to include working drawings and specifications, and an analytical account of the nature and intention of the project. This study would be on the lines of the thesis submitted for degrees in certain university courses. The certificate would be endorsed by the architect with whom the student had served his time.

(3) The first step towards standardizing the different systems of training would be the adoption by the schools of a common syllabus. The syllabus proposed by the Board rests on the general principle that construction is the basis of architecture, and the correlative principle that architecture is the interpretation of construction into forms of æsthetic value. In drawing up this syllabus the Board have been guided by the following considerations:—(1) That it should be thoroughly practical, stress being laid on the teaching of construction as the basis of architecture; (2) that it should not attempt too much, that is, should not overload the student with a vast array of subjects, but should cut down those subjects to the essential and irreducible minimum, and insist on the student obtaining a thorough mastery of the subject as far as he goes. The following is the syllabus proposed by the Board:—(1) Building materials; (2) construction, including (*a*) applied mechanics, strictly in practical relation to construction, and (*b*) the practical methods of the building trades; (3) architectural drawing, including working and freehand drawings, solid geometry, and measured drawings of historial examples of architecture; (4) geometrical projection and rudimentary perspective, this latter to be studied as an aid to the shaping and modelling of building, not as a means of elaborating architectural drawings; (5) design and the history of architecture as supplemental to and elucidatory of the study of construction. These subjects would be taught by class work in the schools and by demonstration in the laboratory or lecture theatre of practical work.

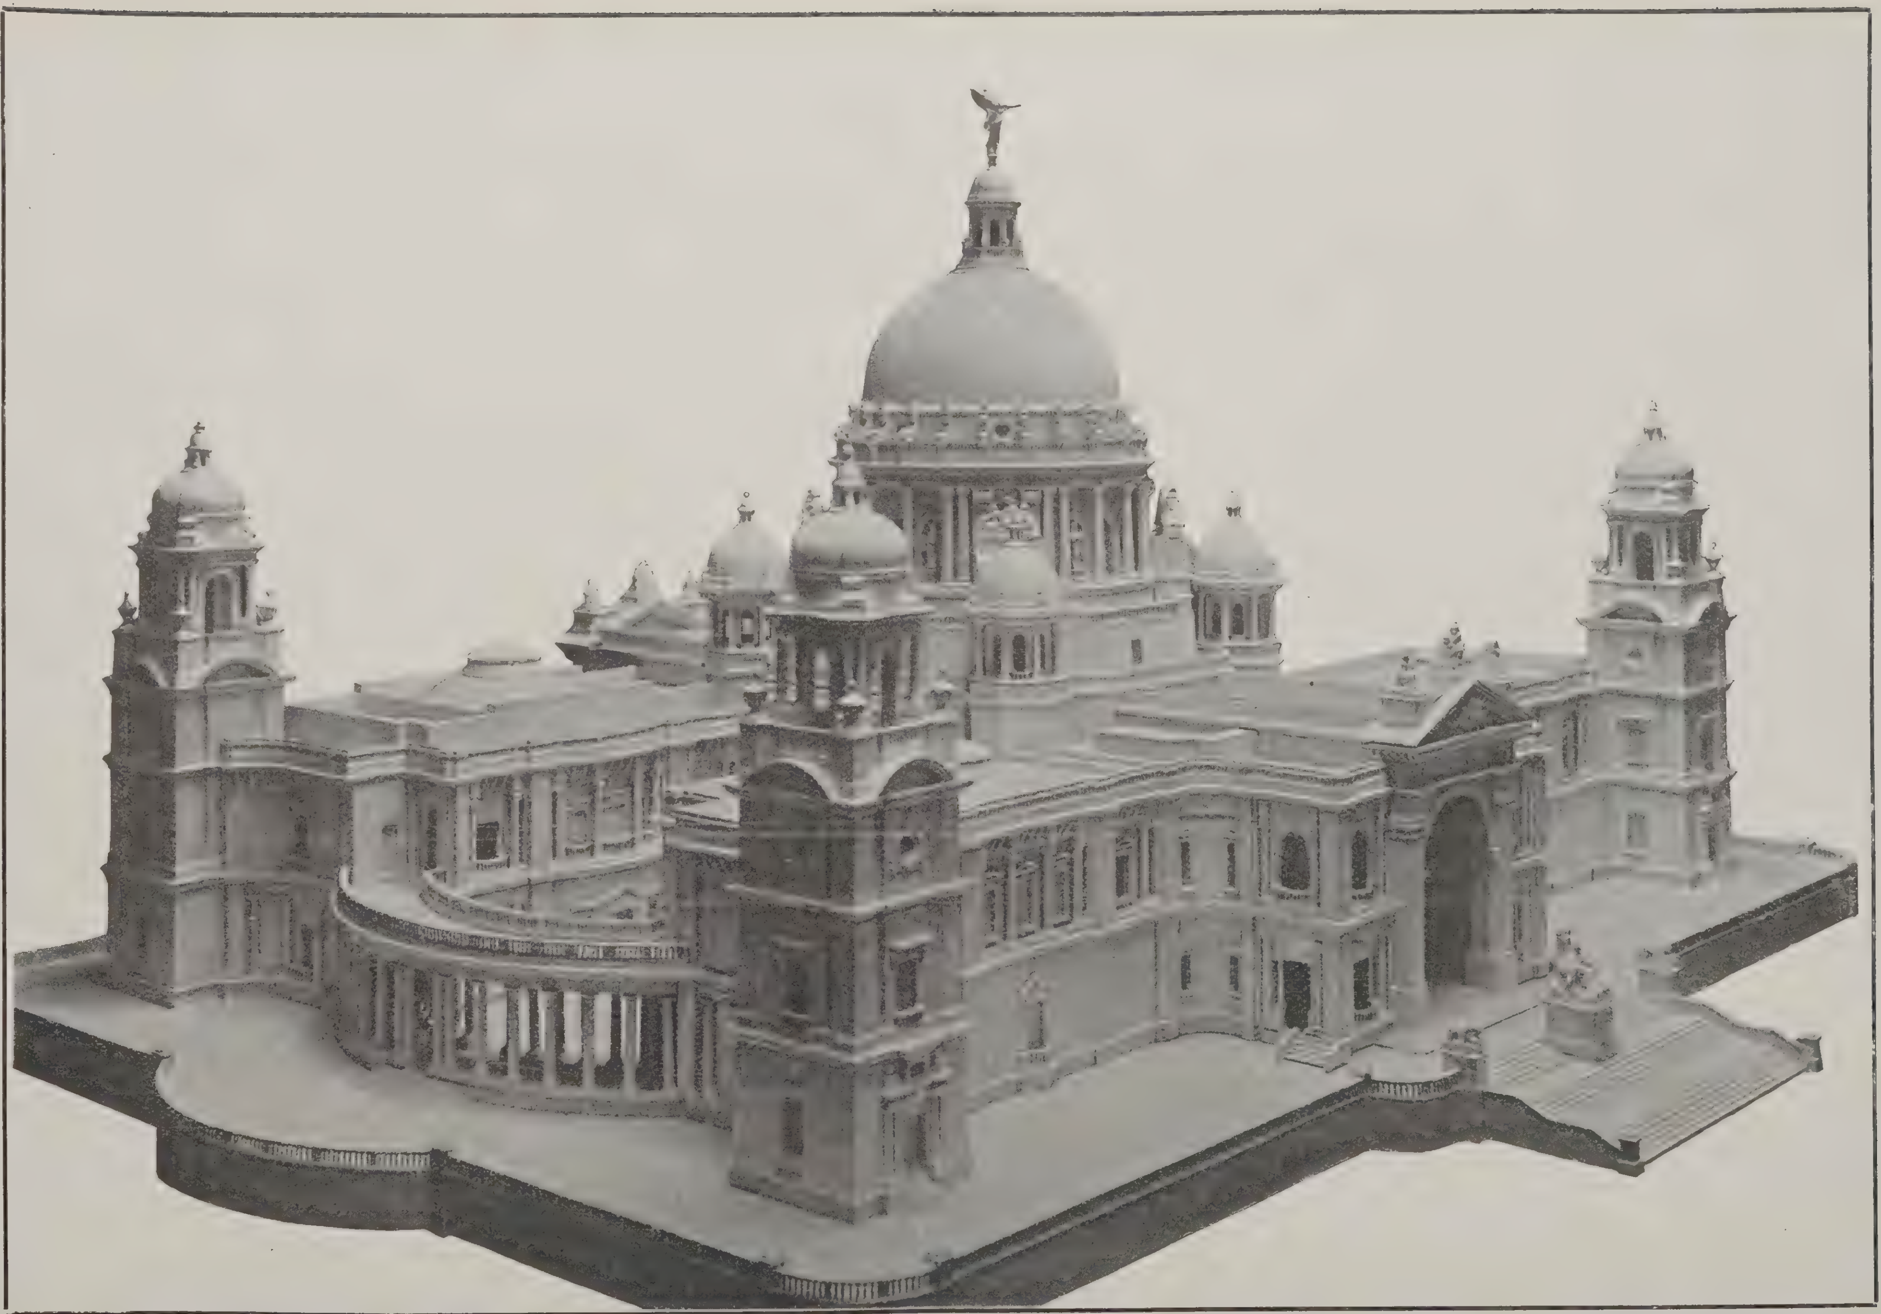
(4) The laboratory or workshop for training in practical work is an essential feature of the scheme. The demonstrations given in the laboratory would be in intimate relations with the lectures given in the classrooms of the schools, and the course would be arranged so that the training in the classrooms and in the workshops should proceed together. The author explained that there was no idea of using these workshops for the purpose of turning the student into a skilled plumber or mason, or whatever the trade may be. The object was to enable him to see with his own eyes, and if necessary handle with his own hands, the various materials and processes employed in order that when he had to direct these processes himself in after years he might have actual knowledge and realization of what he was doing. The author thought there was a little too much of the dilettante and the fine gentleman about the modern young architect; he would do better if he took off his elegant frock-coat and set to work in his shirt-sleeves.

(5) With regard to the steps to be taken to initiate and administer the scheme, these must to some extent be tentative at first. The scheme could only be got under way by the goodwill and co-operation of the various educational bodies concerned; and it was proposed to submit the scheme and its syllabus to recognized architectural training institutions, and to invite them to adopt it. Where engineering schools exist side by side with architectural schools, as in some of the modern universities, the student should avail himself as far as possible of the training there given; but, generally speaking, it was proposed to invite the county councils to place their technical workshops at the disposal of recognized training institutions for purposes of practical demonstration.

In concluding his summary of the proposals the author said that in recommending the adoption of a uniform system and syllabus the object the Board had in view was to reinforce education, to enlarge its opportunities by bringing the schools into touch with one another, so that, for example, their united resources might admit of lectures and demonstrations on a level beyond their attainment individually. The last thing the Board had in view was the establishment of a rigid and inelastic method of training; their aim was the co-operation of the schools in a scheme adopted by them all. It was proposed that the Board of Architectural Education should act as a central advisory body to the several schools, with power to direct the administration of the scheme by means of visitors, who would report to the Board on the work done in the schools. The future constitution of the Board had not yet been determined, but endeavour ought to be made to make it as representative as possible of the profession generally. It was for architects to put their house in order, to prove by visible evidence throughout the country that the practice of architecture is an affair of real skill and solid knowledge; that the architect from his point of view is an expert in building every bit as much as the engineer is from his. When the public realized that to spend their money on building to the best advantage they must go to the architect as the man who really knew his trade, they would readily accord them the recognition due to men of special knowledge and admitted ability in their own calling. The first step to this desirable end was to see to the training of their students, that they, at any rate, should master the technique of the great art of building. So should they prepare the way for the return of architecture to her rightful place as the mistress of the arts.

A discussion followed in which the following took part:—Sir Arthur Rücker, Principal of the University of London, Sir Aston Webb, Prof. F. M. Simpson, Messrs. H. H. Statham, T. G. Jackson, John Slater, Maurice B. Adams, E. M. Gibbs, G. A. T. Middleton, H. C. Corlette, H. G. Ibberson, E. Woodthorpe and John Belcher.

A new Leeds Church.—A new Church of the Holy Spirit is being erected on a site between Lodge Lane and Tempest Road, Leeds, from designs by Messrs. Prothero & Phillott, architects, of Cheltenham. The building is of stone and will accommodate 800; total estimated cost, £11,000.



MODEL OF THE QUEEN VICTORIA MEMORIAL, CALCUTTA. SIR WILLIAM EMERSON, F.R.I.B.A., ARCHITECT.

Photo: Bolak.

This model is made of wood (in about 40,000 pieces) with the exception of some of the smaller columns and figures, which are of brass. It is to ⅛in. scale and stands on a base measuring about 6ft. by 4ft. It is painted white to resemble the marble of which the monument will be entirely built. It has been constructed in London by a young model-maker named Mr. William Salter, who spent nearly a year on it. The cost has been between £400 and £500. Sir William Emerson had an audience of the King last week, when His Majesty expressed his approval of the work. The model is going out to Calcutta and will be used during the erection of the building.

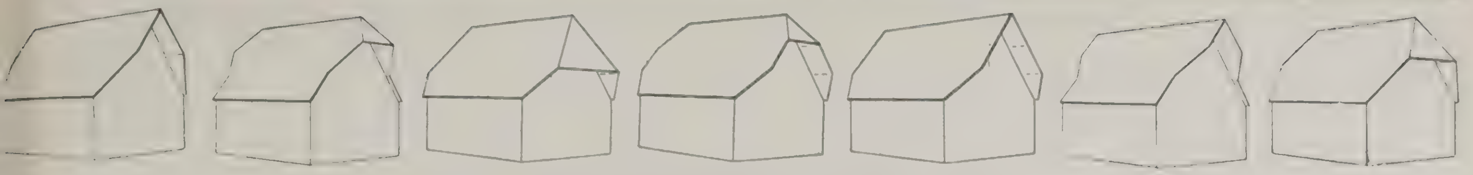


FIG. 2.—TYPES OF OVERHANGING GABLES IN FRANCE.

OVERHANGING GABLES IN FRANCE.

THE overhanging gable is frequently seen in Normandy, where it is a characteristic feature of local architecture. Fig. 1 shows a typical example, in which the projection of the roof serves to shelter from the weather the external staircase of a farm dwelling. In other cases the overhang is made to cover a stack of ladders, or it may be introduced merely for architectural effect. By varying the pitch of roof, the number of purlins, the amount of splay and of hipping, a great variety of form may be obtained, as suggested by Fig. 2. Fig. 3 shows the Normandy gable as applied to a villa, and Fig. 4 a dairy building in which it is combined with overhanging eaves, external purlins both at sides and end being supported on brackets. These are sketched from buildings in the south of France. In Normandy the roofs are slated and the splays are simply cut. In the south, where tiled roofs are general, the verges are finished with fascias of moulded tiles or of wood and zinc, as in Figs. 3 and 4.

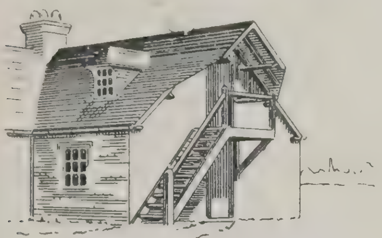

FIG. 1.—FARMHOUSE NEAR ROUEN.

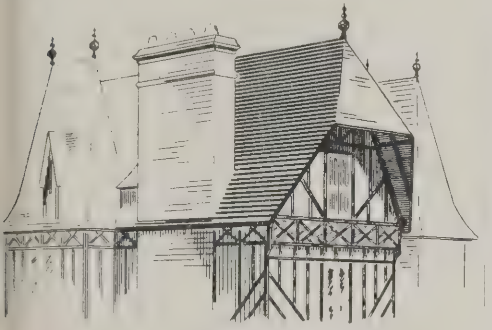

FIG. 3.—VILLA NORMANDE, CANNES.

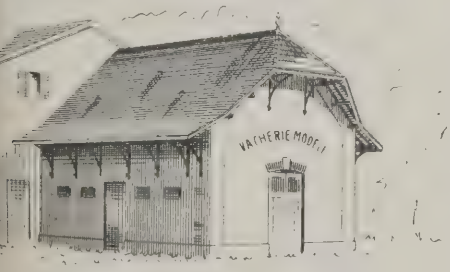

FIG. 4.—MODEL DAIRY AT ST. CASSIEN.

Such a form of roof I have never seen in England, but with modification to suit English materials it might be employed with advantage and effect to cover a bay-window balcony, to protect a hoist pulley or a bell, or for other purposes that will suggest themselves.

ALFRED T. BEST.

INSTITUTION OF CIVIL ENGINEERS.

AT the meeting of this Institution held on Tuesday last week papers were read on the Alfreton second tunnel by Mr. E. F. C. Trench, M.A., B.A.I., M.I.C.E., and on the reconstruction of Moncreiffe Tunnel by Mr. D. McLellan, M.I.C.E. The Alfreton second tunnel was undertaken in 1899 as part of the Midland Railway Co.'s scheme for widening their main line in Derbyshire. The new tunnel is 90ft. from the old and, like it, is half a mile long. It cuts through the coal measures, and several beds of coal were met with, from which fuel for the contractors' engines, &c., was obtained. Owing to the extensive cuttings required at both ends of the tunnel, it was not possible to attack it from the ends; five shafts were therefore sunk on the centre-line, and from these the whole of the tunnelling was done. The tunnel was driven of full size in both directions from each shaft, but when the working faces had approached to within 2 chains of each other, a small heading was driven through, in order that the alignment and levels might be checked. In no case was there any appreciable error, although the only instrument used for setting-out the centre-line was an ordinary 5in. transit theodolite. The tunnel is built of local red bricks and faced internally with best Staffordshire brindled bricks. The thickness of the tunnel ring is 2ft. 3ins., except for a few lengths in which it is 2ft. 7½ins., and the shaft lengths, which are 3ft. thick. Most of the tunnel was worked in lengths of 15ft., but at one point these had to be reduced to 12ft. owing to extra pressure on the timbering. A good deal of water was met with in driving the tunnel, and in order to drain this away from the working-faces earthenware pipes were laid below the invert. The permanent drainage of the tunnel is effected by means of a 2ft. brick culvert built on the invert. For turning the arch of this culvert, centering mounted on a trolley was used. This effected a considerable saving in time, and rendered it possible to build the culvert at the rate of 44 lin. yds. per day. The drainage of the shafts is effected by means of earthenwork pipes built in behind the brick-lining of the shafts and tunnel, and discharging into the tunnel at rail-level. The water which accumulates around the shaft-lining is collected and led to these pipes by means of brick "garlands" encircling the shaft-linings just below the water-bearing strata. The brickwork at the intersections of shafts and tunnel is wholly of blue bricks in cement, the arris being formed of special bricks made to the proper angles.

Special care was taken in designing and building the tunnel-fronts to avoid the failures which sometimes occur at these places. The face-wall was built to a batter of 1 in 6, and in order that the brick courses of the tunnel-ring might be brought in normally to this batter, the tunnel was given a bell-mouth, the vertical axis being increased in length by 2ft. at the face. To increase the longitudinal strength of the tunnel, hoop-iron straps were built between the brick courses at each face.

The time occupied in building the tunnel was nearly two years. The works were carried out at the direction of the company's engineer, the late Mr. J. A. McDonald, M.I.C.E., the contractors being Messrs. Thomas Oliver & Son, and Mr. Trench resident engineer.

At the Moncreiffe Tunnel, on the Caledonian Railway, near Perth, the work of reconstruction was carried on with the aid of four steel travelling shields 32ft. long, 22ft. wide and 16ft. 8ins. high with openings through them 13ft. 8ins. wide and 13ft. 6ins. high for the passage of trains.

Builders' Notes.

Messrs. Patman & Fotheringham, Ltd., are making good progress with the rebuilding of Baltic House, Leadenhall Street, E.C.—Mr. James F. Parker (managing director), Mr. L. Blake (director) and Mr. L. T. Williams (secretary) state that Mr. A. E. Parker, in bankruptcy, has not had any connection with, or interest in, the firm for some considerable time.

Measures Brothers, Ltd.—At the ordinary general meeting held last week, Mr. Robert H. Measures, who presided, moved the adoption of the report and the payment of a dividend on the ordinary shares of 3½ per cent. for the year. He observed that although the profit was not so good as that of previous years, the directors felt that there was much to be thankful for when the company's report was compared with those of other concerns doing a similar kind of business. During his forty years' experience he had never known such a trying period as that through which the company had passed in the past year. Owing to severe competition, orders had been very difficult to obtain, and even then they could only be got at the very smallest margin of profit. Nevertheless the company had held their own, and he was satisfied that when prices advanced, as they must do, there would be a return to the old rate of dividend. At the present time the company had sixty-seven competitors in London alone as compared with thirteen eight years ago. The German, French and Belgian mills had formed a syndicate in order to control the whole of the export from the three countries. An effort was now being made to effect an arrangement with the English mills, and if that were done competition would cease. The company dealt equally with English and with foreign joists. The latter could be obtained to stand higher tensile strain, and with better carrying power at a considerably lower price.—The motion was adopted.

Building By-laws Reform Association.—At the annual meeting held last Wednesday it was stated in the second annual report of the council that the by-laws committee of the Association had drawn up a new set of draft by-laws for rural districts which they thought omitted many of the objectionable regulations of the old methods. These draft by-laws were appended to the report, and the council hoped that they might be adopted in rural districts, or in the rural portions of urban districts, in substitution for the unnecessarily stringent by-laws already in force in those districts. The by-laws committee had not yet dealt with the very difficult question of the amendment of the present model by-laws for the urban districts, but they hoped to be able to take up this work during the present year. The council had felt that immediate alleviation of the grievances of which landowners, architects and builders complained could be given by the drafting of a Bill to exempt altogether certain buildings from the operation of by-laws other than those relating to sanitation. They had accordingly prepared a Bill to provide for the exemption in any district in which by-laws were in force of buildings which it was proposed to erect with a certain amount of open space around and held with them, and also to empower the Local Government Board to recall by-laws sanctioned by them which were found to be inapplicable to the districts in which they were in force. They believed that if the Bill were to become law it would tend to free the country from the grievance which was now so much felt.

Change of Address.—Mr. W. E. Farrer, engineer and sanitary specialist, has changed his London address from Queen Victoria Street to 39, Victoria Street, Westminster.

At the Taunton Municipal Buildings a new hot-water heating apparatus has been supplied and fixed by Messrs. Stanley Sheen & Co., heating engineers, of Sheffield, on their small-pipe safe-pressure system.

Dissolutions of Partnerships.—The following two dissolutions of partnerships are announced—between Messrs. J. Simpson, W. Allen and T. Rose, carrying on business as The Barnacle Hall Brick and Tile Co., near Coventry; and between Messrs. W. Thornley, T. Thornley, C. Butler and A. Waterworth, carrying on business as builders at Weaste under the style of William Thornley & Co.

At the recent Exhibition of School Appliances at South Kensington held in connection with the conference on school hygiene instituted by the Royal Sanitary Institute, Messrs. Adamsez, Ltd., secured the only bronze medal awarded for school sanitary fittings, for their Fig. 115 T. urinals, which are being so largely adopted in all schools throughout the country and in considerable numbers by the War Office authorities at Bordon Camp, Chelsea Barracks, Shorncliffe Camp, &c. Messrs. Adamsez also exhibited their glazed ware division slabs, seat-action pneumatic closet set and Fig. 773 school lavatories, as well as "Adamesk" art pottery.

PETITIONS AGAINST THE L.B.A. AMENDMENT BILL.

THE following petitions have been presented against the London Building Acts Amendment Bill, promoted by the London County Council:—

London Boroughs: Stepney, Paddington, Wandsworth, Hammersmith, Hampstead, Bethnal Green, Holborn, Hackney, Camberwell, Westminster, Stoke Newington, Fulham, Woolwich, Shoreditch, Kensington, Lambeth, St. Pancras and Islington.

City Companies: Ironmongers, Merchant Taylors, Haberdashers, Salters, Skinners, Goldsmiths, Mercers, Fishmongers, Vintners, Grocers and Clothworkers.

Professional Bodies: Institute of Civil Engineers, Royal Institute of British Architects, District Surveyors' Association, Auctioneers' Institute, Surveyors' Institution, Institute of Builders, Institution of Electrical Engineers.

Public Bodies, Companies and Londoners: London and India Docks Co., the Duke of Westminster, the Ecclesiastical Commissioners, Lord Llangattock, Mr. Edward Yates, the Bridewell and Bethlem Hospital, the Improved Industrial Dwellings Co., the Surrey Commercial Docks Co., the Westminster Electric Supply Corporations, Association for the Protection of Property Owners, Metropolitan Water Board, the London Chamber of Commerce, the Hon. Societies of Lincoln's Inn, Inner Temple and Middle Temple, the Stock Exchange, the railway companies owning lands in London, the Gordon Hotels, companies supplying electrical energy in London, general storekeepers and drapers, the Gas Light and Coke, South Metropolitan and Commercial Gas Cos., Messrs. N. M. Rothschild & Sons and other banking houses, the National Telephone Co., the Wharfingers' Association, associated owners of City properties, associated landowners and others.

There are eight petitions against the Bill which is being promoted by the Corporation. These are from the London County Council; the Great Eastern, Metropolitan, Metropolitan District and North London Railway Cos.; the Hon. Societies of the Inner Temple and Middle Temple; and the London and India Docks Co.

Keystones.

To complete the Repair and Restoration of Chichester Cathedral a further sum of £5,000 is required. The money already subscribed has been expended without the bell tower (which is to be completely restored) and the roof being touched.

The Palais Royal, Paris, is to be radically altered by an American syndicate. Shops, restaurants and even the historic theatre are to disappear, and in their place will arise a new spacious theatre and a sky-scraping hotel, while the shops will be run on American lines.

Battle Bridge; King's Cross.—Here is a dreadful instance of a wrong change in street names—from Battle Bridge, where Boadicea fought the Romans, to King's Cross, which took its name from the worst statue on record—of George IV.—("Daily Chronicle.")

For a new Infirmary at Alnwick the design of Mr. J. Wightman Douglas, architect, of Newcastle and Alnwick, has been selected in competition, this having been awarded the first premium of £100 by Mr. Frank Caws, of Sunderland, the assessor. Twenty designs were submitted.

The Wallasey Public Offices Competition has been decided as follows:—First premium (£250), Messrs. Briggs, Wolstenholme & Thornely, of Liverpool; second (£75), Mr. A. R. Jemmett & G. T. M'Combie, of London; third (£50), Mr. W. H. Ashford, of Birmingham. Ninety-six designs were submitted, Sir William Emerson being the assessor.

Northumberland War Memorial.—Mr. T. Eyre Macklin, R.B.A., of Newcastle, has been selected for this memorial. Mr. Thornycroft, R.A., was the assessor. There were forty-one competitors. Mr. Macklin will receive one hundred guineas for his services in connection with the preparation of the model, &c., and the erection of the memorial, a site for which has been provided at Barras Bridge, Newcastle. The total cost will be £2,000.

Society of British Sculptors. — At the statutory general meeting held last week Mr. Thomas Brock, R.A., was elected president, Sir C. Lawes-Wittewronge treasurer, Mr. Percy Edsall secretary; council: Mr. Drury, Mr. Frampton, Mr. W. S. Frith, Mr. F. Lynn Jenkins, Mr. W. Goscombe John, Sir Charles Lawes-Wittewronge, Mr. T. Stirling Lee, Mr. D. McGill, Mr. Pomeroy, Mr. Reynolds-Stephens, Mr. Hamo Thornycroft and Mr. F. Derwent Wood.

Mr. Edward S. Prior, M.A., presented the prizes to students of the Birmingham Municipal School of Art last Wednesday. He delivered an address in the course of which he spoke of the erection of a cathedral in Birmingham. Why should it not be for them to create, to build it, decorate it, and fit it as a church of this century? If built by them as architect-masons and architect-carpenters, if sculptured by them as craft sculptors, if decorated by them as craft painters, smiths, glaziers and tilemakers, the cathedral would be, as were the ancient cathedrals, a growth from the art life of to-day which the city of Birmingham was so strenuous in maintaining. What mimicking copy could be half as fine a thing as that?

Edinburgh Architectural Association.—At last Wednesday's meeting of this Association the Rev. Professor Cooper, of Glasgow University, read a paper on "A minister's thoughts in regard to the arrangement and furnishing of a Scottish parish church," in the course of which he praised a committee for the building of a new church in a northern town who had told the selected architect that what they chiefly wanted was a fine interior. That showed a great advance upon the time, not long past, when it was outside elegance only that was thought of. He proceeded to denounce side galleries and sloping floors, and said that the worst place possible for the organ was the chancel. He recommended a return to the pulpit canopy; advised that the chancel should not be too deep, yet spacious and unencumbered; and concluded by expressing the hope that the Scottish universities would soon, like Manchester and Liverpool, be supplied with Chairs of Architecture.

Obituary.

Mr. Daniel Wilkinson, builder, of Southport, died on Wednesday last, aged 62.

Mr. R. S. Davenhill, a director of Messrs. Hinton, Perry & Davenhill, Ltd., roofing tile manufacturers, Pensnett, died recently, aged 38. For eleven years he was with Mr. Henry Lovatt, of Wolverhampton, and for seven with Messrs. S. Pearson & Son, of London. For the latter he carried out the big tunnel on the new South Wales direct line. This was a difficult task, and resulted in the breakdown of his health and the resignation of his position with Messrs. Pearson.

Mr. Oswald E. Prest, of the firm of Messrs. E. J. Prest & Co., artists in stained glass, died recently at the early age of 22. He was a promising young artist and designer, a successful student at the Camden School of Art and the Central School of Art and Handicraft, Regent Street, an exhibitor at the Royal Academy, and a successful competitor in the "Studio" competitions, obtaining a first prize as recently as December last. He had spent the autumn in the neighbourhood of Penzance, hoping to benefit by the open-air life in landscape painting, to which he turned with great facility, but was compelled to return home owing to increased weakness, and he died of consumption on February 8th.

Mr. James Thomson, F.R.I.B.A., I.A., of the firm of Messrs. John Baird & James Thomson, architects, Glasgow, died on February 12th. Mr. Thomson acted as architect in connection with many of the larger buildings in Glasgow, including those of the Standard Assurance Co. in Gordon Street; the Lancashire Insurance Co. and the Liverpool, London and Globe Insurance Co. in Hope Street; and the Scottish Union and National Insurance Co. in West George Street; as well as several buildings in Glasgow and throughout Scotland for the Clydesdale Bank and the British Linen Co. Bank. He was also architect for the Shaw Convalescent Home at Bearsden, the Royal Asylum for the Blind in Castle Street, Glasgow, and for the Dumbarton Municipal Buildings. Among the numerous mansion-houses erected from his designs are Belmont Castle (the seat of Sir Henry Campbell-Bannerman); Orie House, Aberdeenshire; Birkwood House, Lesmahagow; Kinnaird House, Stirlingshire; and Gartshore House (for Mr. Alex. Whitelaw, M.P.). Mr. Thomson's services were also much in request in connection with the valuation of property and in property arbitrations. He was twice president of the Glasgow Institute of Architects, and some years ago acted in a similar capacity in the architectural section of the Philosophical Society.

NEW BRIDGE AT LUXEMBURG, IN COURSE OF CONSTRUCTION.

NEW BRIDGE AT LUXEMBURG.

We are able to publish this week a photograph showing the remarkable centering used in the construction of this bridge, with its large stone arch, a view of which, as completed, was given on p. 93 of our issue for last week. The photograph speaks for itself and needs no comment on our part.

M. RODIN ON ARCHITECTURE.

In the February issue of the "North American Review" there is an interesting article by M. Auguste Rodin on "The Gothic in the Cathedrals and Churches of France," from which the following extracts are taken:—

No architect or sculptor has ever been able properly to restore a Gothic church or cathedral . . . The Italians, it is true, continue to repair their ancient monuments; but they only touch the parts that are falling to ruin; whereas when we repair we insist on restoring, and spoil the old in order to harmonize it with the new. . . . Our French cathedrals are superior to the English and German ones by the greater sculptural expression displayed in them. In this respect they are second to nothing outside antique Greek architecture. The German Gothic is characteristically hard. The cathedrals at Strasburg and Cologne exhibit this defect, but, like that at Milan, more on the exterior than in the interior. The interior of the Cologne edifice is very fine, and yet the structure as a whole does not possess that supreme art for lack of which the largest cathedral appears smaller than a small church which has it. Antwerp cathedral is very beautiful, more beautiful than Cologne. . . .

In one direction the Gothic sculptors surpass the Greek. The Greek temple is the same everywhere, and similarity, identity, is not a culminating quality of art. Life is made up of strength and grace most variously mingled, and the Gothic gives us this. . . . The study of Gothic has unquestionably influenced my sculpture, giving me more flexibility, more depth, more life in my modelling. . . . In order to reform our present stereotyped methods of art we want a second Renascence. For a long time I hoped that in a near future this might be; but I have ceased hoping to-day. It would require a catastrophe capable of overturning and changing everything. Of course, I am speaking of what is likely to happen in the next twenty-five or fifty years. Life is eternal; and, sooner or later, things must alter for the better. But, so far, in our modern architecture I see nothing that gives encouragement.

We have intelligent men who are sufficiently educated. They copy everything; they ferret out the style of Nineveh, as well as the styles of Louis XIV. and Louis XV.; but what they produce is without soul, without art and is insignificant. They repeat, but only as the parrot does. For long years we have done nothing but turn out from our colleges young men stuffed with useless scientific lumber; and they very quickly lose it all, and there is nothing to take its place.

OUR PLATES.

The two photographs of the Rector Building, Chicago, in course of erection, are interesting as showing a typical example of the large steel-frame buildings of the United States and the expedition with which American contractors proceed with their work. The huge cranes supported from the floors and the absence of scaffolding are particularly noteworthy. We are indebted to the American "Fireproof Magazine" for our illustrations.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Architectural Training.

Redhill.—Scholar writes: "Do you consider it would be beneficial for an architectural student to take a two years' course of study at the Royal College of Art, South Kensington, under a National scholarship, after having served about five years in an architect's office and studying at the local school of art? Do you think it would be better than continuing in an office and working at a small school?"

Yes, we think it would be better for him to attend the architectural school at South Kensington.

Buildings to Measure near Lowestoft; Architectural Lending Library.

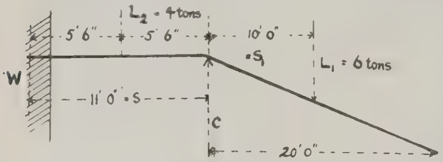
Highgate.—Student writes: "(1) Please name some buildings worth measuring near Lowestoft. (2) Is there an architectural lending library in London; if so, from whom can I obtain particulars?"

(1) Churches at Lowestoft, Beccles, Barsham, Haddiscoe, Loddon and Chedgrave would prove good specimens for your purpose. (2) If you are a probationer of the R.I.B.A. you can borrow books from the library and can obtain full particulars thereof from the secretary R.I.B.A., 9, Conduit Street, W. Failing this, the only other course open to

you is to join the Architectural Association, which has a library of its own—particulars of the secretary, Architectural Association, 18, Tufton Street, Westminster, S.W. M.

Gallery Cantilever.

LONDON, E.—Mr. F. W. JENNINGS writes: "The accompanying illustration is a solution



of this problem, which leaves no doubt as to its accuracy. To simplify the matters L_1 is taken as acting at its centre of gravity and L_2 central between supports. To find the reactions, we have for equilibrium—

$$CS - L_2\frac{S}{2} - L_1(S + S_1) = 0$$

$$- WS + L_2\frac{S}{2} - L_1S_1 = 0.$$

Solving, we get—

$$C = L_1 + \frac{L_2}{2} + \frac{L_1S_1}{S};$$

$$W = \frac{L_2}{2} - \frac{L_1S_1}{S};$$

or $C = 6 + \frac{4}{2} + \frac{6 \times 10}{11} = 13{\cdot}45$ load on column,

$W = \frac{4}{2} - \frac{6 \times 10}{11} = -3{\cdot}45$ anchorage required."

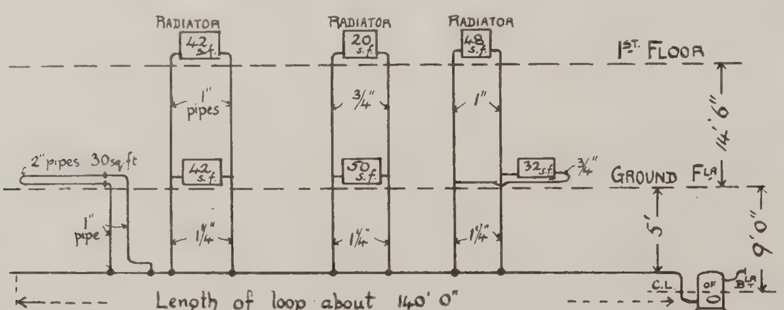
"Tarmac."

Referring to the enquiry and reply on p. 65 of our issue for February 1st, Mr. S Doddimeade Edmunds, M.S.A., writes: "Your correspondent will get all information of this material, also price laid complete, from Mr. Vernon Parker (Tarmac Department), of 20, Victoria Street, London, S.W., who is the London agent for "Tarmac.'"

Hot-Water Installation.

BEDFORD PARK.—HOT WATER writes: "I should be glad to have a good general practical formula for calculating the size of main pipes in a low-pressure hot-water heating installation, and its application to the case shown by the accompanying illustration. It would appear to me to depend mostly upon the radiating surface and its average height above the source of heat."

The size of the pipes is decided by the area of heat-yielding surface they feed, and the weight of water the surface contains. A good general practical formula, and one that will not degenerate into a clumsy and inaccurate rule-of-thumb, is to divide by 100 the area of heating surface in square feet, the quotient being the area of the pipe in square inches; or conversely, to multiply the square inches area of the pipe by 100, the result being square feet of heating surface. Thus, the area of a pipe 1in. bore is 0·78 sq. ins., and it will feed 78 sq. ft. of heat-yielding surface, though many would say only 75. If you check this rule by adding to the area thus found the weight of water enclosed by the heating surface (you may use gallons if you like, but weight in lbs. is better) and proportion the pipe to this total, you will be safe. To make sure of the current not reversing, and to aid the speed of flow, the last few feet of the return should be a size larger, when the extra weight of cool water will send the current quicker in the right direction. The driving power is the greater weight of the cooled water; it is connected with the proportion of heat-yielding surface to weight of water and its height above the heat-receiving surface. The loop main is probably of cast-iron with funnel elbows put face and tail to the current at the rise and drop pipes; and in settling its size the area of the outside of the funnel must be reckoned, and not that of its pipe. The main cannot practically be less than 3ins., with a 3in. flow-socket, and the return drop at the boiler side can be 4ins. with a 3in. socket. It is the coldness of the return water that drives the flow, and the extra size is to give the water more exposure and time to cool. If the boiler be "independent," a screen between it and the down pipe will catch the radiation from the boiler side and keep the pipe cooler. O. WHEELER.



HOT-WATER INSTALLATION

The National Competition.

GLASGOW.—G. M. S. writes: "Are Scottish students still at liberty to send up architectural works for the National Competition, as now no works of Scottish students are sent up by the various schools of art, which are at present under the control of the Scotch Education Department? Is it allowable for individual students to compete?"

Paragraph 18, form C. 363, issued by the Scotch Education Department, states that "in all cases where works from schools in Scotland are to be entered for this competition notice should in the first place be given to this department not later than March 1st. No payment will be made as formerly on the works so entered, but they will be eligible for the award of prizes in the competition. It is specially requested that managers and teachers will take particular note of the fact that only such works should be selected and sent forward to the Board of Education, South Kensington, as appear likely to have a reasonable chance of gaining awards at the National Competition. Candidates submitting art works for the art class teacher's or the art master's certificates must forward them through the managers of the classes with which they are connected, in the same manner as works for the National Competition. Full detailed instructions will be found in form 564 issued by the Board of Education."

Queen-Post Roof-Truss.

SHEFFIELD.—PERPLEXED writes: "How can I obtain the stress diagram of a queen-post roof-truss?"

The stress diagram for vertical loads on a queen-post roof-truss is easily found by the usual methods, which are dealt with in most books on building construction or stresses; for instance, Allen's "Building Construction" and Middleton's "Stresses and Thrusts." When we come to work out a diagram for the wind loads it is at once seen that a queen-post truss requires braces in the centre panel. If they are omitted in practice the members and joints have to be strengthened to make up for the omission.

Office of Works.

NORTHAMPTON.—J. C. H. writes: "Where can I get particulars of the appointments for architectural assistants in the Office of Works, and where can the examination papers be obtained?"

We have answered this question over and over again—most recently in our issues for April 6th, April 20th and July 13th, 1904 If you refer to those issues you will find all the information you desire.

Setting-out Curves by means of Ordinates.

PLUMSTEAD.—P. A. S. I. writes: "The following formula for setting-out curves by means of ordinates appears on p. 243 of Usill's 'Practical Surveying,' 7th edition:—

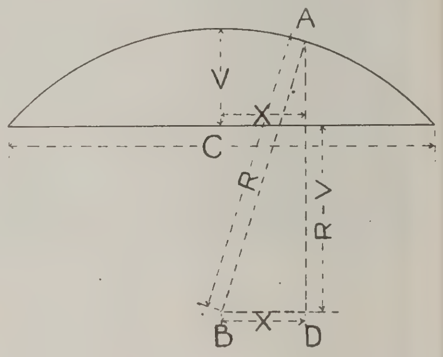
$$O = \sqrt{R^2} - X^2 - (R - V).$$

Is this correct? I do not think it is. I have arrived at the conclusion that it should be

$$O = \sqrt{R^2 - X^2} - (R - V).$$

Am I right or not?"

You are obviously correct, as shown by the diagram below, when C = the chord,



V = the versed sine, R = the radius of the curve, X = the distance of ordinate from centre of chord, and O = the length of the ordinate. Then in the triangle ABD, AB represents the radius, BD = X and AD = O + (R – V); and as it is a right-angled triangle –

$$AB^2 = BD^2 + AD^2.$$
$$\therefore\ R^2 = X^2 + \{O + (R - V)\}^2.$$
$$\therefore\ \{O + (R - V)\}^2 = R^2 - X^2.$$
$$\therefore\ O + (R - V) = \sqrt{R^2 - X^2}.$$
$$\therefore\ O = \sqrt{R^2 - X^2} - (R - V).$$

G. A. T. M.

Cheap Blackboard.

LIVERPOOL.—T. E. M. writes: "Which is the cheapest form of home-made blackboard either of wood or cardboard?"

Framed deal is the best for the purpose. As regards colouring a blackboard the following is a recipe:—Dilute liquid soda silicate (water glass) with its own bulk of water and add just enough lampblack to colour it.

Architectural Fitment of Ships.

SUNDERLAND.—G. H. S. writes: "I am a shipjoiner; I hold first-class elementary and first-class advance certificates in building construction; I also gained a 15s. book prize for architectural drawings in the National Competition. I am acting as setter-out at Sir James Laing & Sons, Ltd., Sunderland. What course should I pursue to become a designer of ship-saloons, music-rooms, smoke-rooms, &c., somewhat like those published by you on April 10th, 1901?"

You should attend courses in design and cabinet work and read books on art subjects generally. Then try to get in the office of a firm doing this class of work, though we may say it is confined to a few firms only.

Trade and Craft.

The Surface of Floors.

If imitation is the sincerest form of flattery, the Euboeolith Patent Flooring Co. may well take heart from the fact that several imitators of their system of flooring have appeared on the English market. Time is the only test of a flooring, and as Euboeolith has stood the test of many years it need have nothing to fear from the systems of flooring now making their appearance. Close on 600,000 yds. of Euboeolith have been laid by this company, and they have several large orders in hand.

The flooring is suitable for all kinds of buildings; in fact, it is difficult to say if there is a class of building for which it is not suitable. At the present time it is in use in churches, mission rooms, palaces, mansions, hospitals, infirmaries, operating theatres, schools, houses, clubs, barracks, waiting-rooms, municipal buildings, offices, shops, mills and factories.

The materials used in the composition are secret. It is laid in a plastic condition on to the rough concrete bed, or it can be laid on a flagged or tiled floor, or upon any firmly nailed wooden floor. Its adhesion to any of these is perfect. It has a thoroughly jointless surface, which can, if desired, be highly polished. The flooring is rapidly laid and can be used soon after it has been put down, although it is advisable to allow a fair time for setting, as floors of this description get marked if used too soon after finishing off. It is advisable for a floor in a new building to be laid when practically all other trades have finished.

So waterproof and non-absorbent is it that a room covered with the material and with a coved skirting carried 3ins. or 6ins. up the walls could if desired be flushed with a hose pipe. Euboeolith possesses also the additional advantages of being fire-resisting, jointless, noiseless, agreeable to walk upon, and of being able to stand heavy and rough traffic. It can be laid in several colours, and the colours are permanent, going through the entire thickness of the material. When laid Euboeolith strongly resembles cork carpet, and being warm the extra expense of carpet is saved. It is supplied by Mr. J. Percy Day, of 3, Victoria Street, Westminster.

Coming Events.

Wednesday, February 22.

Royal Sanitary Institute. — Inspection and Demonstration at Islington by Mr. James R. Leggatt, Supt., Public Health Dept., Islington, at 2 p.m.

Edinburgh Architectural Association.—Mr. Charles E. Elcock on "Through York with a Camera," at 8 p.m.

London Master-Builders' Association. — Annual Dinner and Presentation to Mr. J. Howard Colls, Trocadero, at 6.30 p.m.

Thursday, February 23.

King's College Architectural Society.—Mr. Ronald P. Jones, M.A., on "Saracenic Architecture in Cairo," at 5.30 p.m.

Leeds and Yorkshire Architectural Society. —Mr. Maurice B. Adams, F.R.I.B.A., on "More about Modern Libraries," at 6.30 p.m.

Royal Academy.—Professor Aitchison, R.A., on "Vitruvius," at 4 p.m.

Carpenters' Company.—The Rev. W. Marshall on "Our Old Parish Churches," Carpenters' Hall, at 8 p.m.

Friday, February 24.

Glasgow Technical College Architectural Craftsmen's Society. — Mr. Colin Sinclair on "Steel Construction," at 8 p.m.

Architectural Association.—Mr. F. J. Osborne Smith, A.R.I.B.A., on "Country Houses and Accessory Buildings," at 7.30 p.m.

Institution of Civil Engineers. (Students' meeting).—Mr. F. D. Flint on "Morecambe Sewerage: Method of laying a 15in. Cast-iron Sewer under the London and North-Western Railway," and Mr. H. M. Rootham on "The Reconstruction of Bow Bridge over the River Lea," at 8 p.m.

University College.—Mr. D. S. MacColl on "Dyce and Watts: Attempts to Revive Mural Painting," at 4.30 p.m.

Saturday, February 25.

Royal Sanitary Institute. — Inspection and Demonstration at the Battersea Disinfecting Station, Mortuary and Shelter, by Dr. G. F. McCleary, at 2.15 p.m.

Builders' Foremen's Association.—Mr. F. M. H. Joneson "Slag-wool," Memorial Hall, Farringdon Street, E.C.

Architectural Association.—Third Spring Visit to New Sessions House, Old Bailey, at 2 p.m., and Coutts's Bank, Strand, at 4 p.m.

Royal Institution.—Mr. D. G. Hogarth on "Archæology," at 3 p.m.

Monday, February 27.

Surveyors' Institution.—Meeting at 8 p.m

Liverpool Architectural Society. — Rev T. W. M. Lund on "The Classical Architecture and Sculpture of Rome," at 8.45 p.m.

Tuesday, February 28.

Northern Architectural Association. — Mr. W. H. Wood on "The Design and Construction of the Spire of Newcastle Cathedral," at 7.30 p.m.

Architectural Association of Ireland. Paper by Mr. Frederick G. Hicks, at 8 p.m.

Wednesday, March 1.

Royal Sanitary Institute. — Inspection and Demonstration at St. Pancras, conducted by Mr W. G. Auger, sanitary inspector, at 3 p.m.

Surveyors' Institution.—Annual dinner, Hotel Great Central, at 7 p.m.

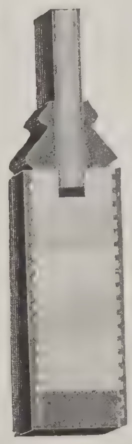
53 BERNERS STREET
LONDON



All the material used in the Framing of these Doors is put together as shown here.

The Interior "Core" is made in strips of selected pine with the grain reversed, and dried with 200 degrees of heat.

The Exterior Hardwood Facing is welded to the Core by means of immense pressure, making in effect one solid piece

RICHLY CARVED DOORS carefully reproduced from old models can be made in any hardwood, possessing all the elegance and richness of figure and colour found in the antique examples.

ARCHITECTS are invited to inspect the specimen doors on exhibition to satisfy themselves as to the construction, quality and artistic merit. Sample doors can be seen at the Showrooms of the various agents, or at 53, Berners Street, London, W.

A GUARANTEE. The Gilmour Door Co., Ltd., will give a guarantee with all their doors that they will not warp, twist, split, shrink or crack. They are absolutely reliable.

COST. A well-made Hardwood Door can be obtained at prices varying from 35s. to £10.

CATALOGUE. A book of designs, prices, &c., will be sent on application to "Dept. B," 53, Berners Street, London.

* Accepted. [Quantities by architect.]

Electrical Notes.

Private Mains across a Street.—A correspondent in the "Electrical Review" raises an oft-recurring question on this point. He is in charge of an isolated plant, with other premises across the street which is desired to be lighted from the plant, and he asks whether he can carry cables overhead across the street; to which our contemporary replies that he is perfectly at liberty to do so. The only conditions are that he complies with the Board of Trade regulations as to mode of suspension, &c., and that he obtains the necessary wayleaves from private owners whose property is crossed by the overhead mains. The corporation cannot interfere with him or with his cables unless it owns the freehold of the roadway. The cables must not be less than 30ft. from the street level (in London 35ft.).

"Earthing" to Gas and Water Pipes.—An interesting paper on "Earthing" was read before the Institution of Electrical Engineers at Glasgow last week by Mr. W. W. Lackie, who pointed out that gas pipes should not be used as earth connections, as frequently the current which flows to earth when a conductor gets in contact with an earth is sufficient to melt a soft metal pipe; and further, the method of jointing a branch gas pipe of iron to a main gas pipe often does not make a good contact between the branch and main, the branch pipe being in some cases insulated by brown paper and white lead. A water pipe is almost universally used for an earth connection. All electric conductors should be kept away from gas pipes and most carefully insulated from them by a spacing not less than 1in. thick, no matter what system of wiring be adopted.

Parcels Delivery on Tramways. The Manchester Corporation have decided to adopt a parcels-carrying scheme on the electric tramways of the city. Parcels will be despatched every quarter of an hour, and taken to their destinations by boys or in carts. The charge for the inside area will be 2d. to 6d. for 14 lbs. and 112 lbs. respectively, and delivery in the outside area will be from 3d. to 8d. for those weights.

A Steel Chimney.—In connection with proposed extensions to the corporation electricity-generating station at Portsmouth, Messrs. Kincaid, Waller, Manville & Dawson recommend the erection of a steel chimney shaft, lined throughout with firebrick, 11ft. internal diameter at the top, with brick base supported on concrete and steel foundations; height above firing-floor level, 200ft. The cost of this chimney is put at £4,300, and the total cost of the work at £7,689.

New York Tramways.—The conduit system of tramways alone is permitted in New York proper (Manhattan Island), though the overhead system still prevails in Brooklyn and the outlying districts, and also in Jersey City. In all there are 210 miles (counted as single track) of conduit lines in New York, compared with the 185 miles of tramways (also counted as single track) in the county of London. In New York a universal 5-cent fare ($2\frac{1}{2}$d.) is charged, but as the transfer system prevails (entitling a passenger by the payment of one fare to a continuous ride over two or more lines), so large a proportion of passengers take advantage of it that the average fare per journey is reduced to $3\frac{1}{8}$ cents, or very slightly more than $1\frac{1}{2}$d. A single fare under this system may be made available for a distance of 15 miles. The average speed on all the lines is 10 miles per hour, as compared with 8 miles for London.

CARPENTERS AND JOINERS.

912.—Carpenter used to building, jobbing or estate work.

944.—General Joiner. Alterations, &c., or otherwise. Town or country all-round exp. Trade, carpenter and joiner; mod. s.

CLERK OF WORKS.

866.—Clerk of Works. Good refs., shortly disengaged.

893.—Clerk of Works. Now wkg. on mansion after fire; shortly disengaged.

929.—Builder's Manager or Clerk of Works, Practical; energetic; abstainer; good refs., or manage branch business.

945.—Clerk of Works, practical, exp. and reliable; 3 yrs. last job., mod. s. Town and country.

CLERKS.

861.--Builder's Clerk wants two days per week, abstracting, p.c., and jobbing acs.

869.—Builder's Clerk and Draughtsman (23), wkg. and detail drawings, tracings, quantities, estimating, contract and jobbing.

CLERKS—*continued.*

882.—Builder and Contractor's Clerk. P.C. accounts, book-keeping, drawing, and quantities and estimating, ex. refs.

887.—Builder's Clerk and Assistant. Life exp. jobbing work. Estimating decorating and sanitary work, good refs., mod. s. Could manage.

906.—Builder and Contractor's Clerk. P.C. bookkeeping, shorthand and typewriting, ex. refs.

946.—Builder's Clerk, P.C. accounts, bookkeeping, drawings, quantities and office routine, mod. s., ex. refs.

FOREMEN.

880.—General Foreman, 35, good manager and organiser, used to West End. Experienced. Trade. joiner; abstainer.

895.—General or Shop Foreman of Joiners; 1st class exp.; good technical knowledge; thoroughly practical.

902.—House Painter, &c. (36), wants foremanship; 20 yrs. varied exp., 14 yrs. last two masters.

903.—General Foreman (50) seeks re-engagement, 28 yrs. foreman's exp.; carpenter by trade; 1st class refs.

925.—General Foreman (50); 21 yrs. London exp. as Foreman. Used to best work, 1st cl. refs.

926.—Shop Foreman (Joiners), or leading hand, good stair-builder, quick and accurate setter out. Foreman 8½ yrs.

928.--General Foreman (36), Country estate. Thoroughly practical, abstainer; joiner, 1st class refs.

943.—General Foreman, practical. Knowledge of all branches of building trade; 20 yrs. exp., good refs. Carpenter and joiner, abstainer.

MISCELLANEOUS.

885.—Stone Turning by exp. man, day or piecework. Balusters and finials a speciality.

908.—Leaded Lights, Manager and Designer, trustworthy, experienced, good refs., age 31.

909.—Machinist (Joiner), used to 1st class work, good refs.

910.—Quantities. Taking off, working up, mod. terms.

911.—Electrician. Light, bells, and telephone plant, &c.

914.—Manager or other responsible post wanted. Thorough knowledge of building and decorating trades and estate managing. 8 yrs. in builder's and contractor's.

933.—Brickwork and Pointing wanted, town or country, rod or lump. Good refs.

942.—Builders' Assistant, age 23. Competent, office or outside; books quantities; estimating; abstainer. Draughtsman, ex. refs.

PLUMBERS & FITTERS.

899.--Plumber, good; can take on new and old work; good refs.; 20 yrs. last job.

901.—Plumber wants employment, town or country; can turn hand; wages moderate if constant.

905.—Good Plumber, gas, hot-water and zinc joiner, repairs; draughtsman estate, institution or builder; 12 yrs. refs.

QUANTITY SURVEYORS.

894.—P.A.S.I (Bldg. Sub-division), good all-round exp.; wkg. and detail drawings, surveying, &c.; mod. s.

897.—Quantity Surveyor and Builder's Assistant wants temporary or permanent work; ex. refs.

THE

BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD.

March 1, 1905. Vol. 21, No. 525. 6, Great New Street, Fetter Lane, E.C.

Summary.

Electric hoists and derricks on building operations have many advantages. They are under perfect control, can be moved about with the greatest facility, are economical in working, and are cleaner, cheaper and better than steam hoists. A standard tramway type of 25-h.p., when connected to a winch through double reduction gearing, will lift 1,800 lbs. at the rate of 150ft. per minute, and it will do it day in and day out without winking and at a cost of about one-third to one-half that of a steam hoist for similar service. (Page 110.)

Very great progress is being made with the erection of the Ritz Hotel in Piccadilly. The steelwork is now up to the seventh floor and the stone casing up to the first. (Page 111.)

Mr. Stuart Jones is giving up his directorship of the British School at Rome. (Page 120.)

An action has been decided in favour of the Accrington Brick and Tile Co., Ltd., and others, against a firm making bricks ten miles from Accrington and falsely calling them "Accrington facing bricks. (Page 120.)

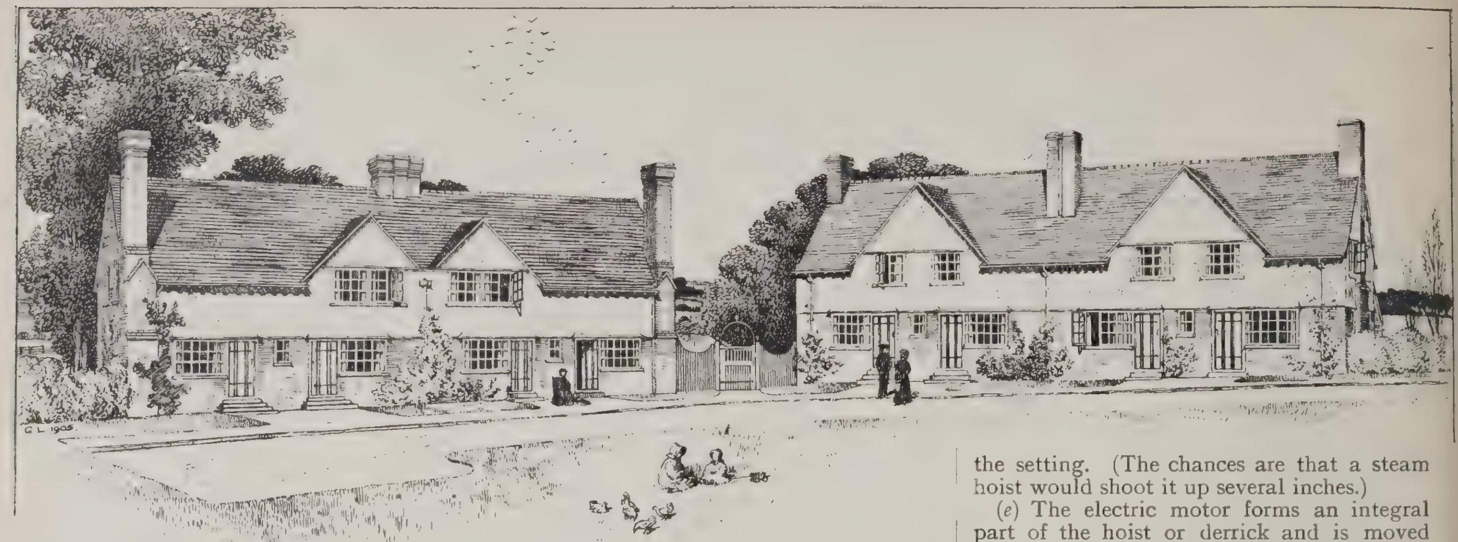
Speaking at the annual dinner of the Edinburgh Architectural Association Mr. Crabb Watt, K.C., referred to the Usher Hall, observing that if the Association asserted its views more forcibly the demolition of a not untasteful structure in the Synod Hall, and the waste of money which could go to the beautifying of a hall on a vacant site, might be prevented. (Page 119.)

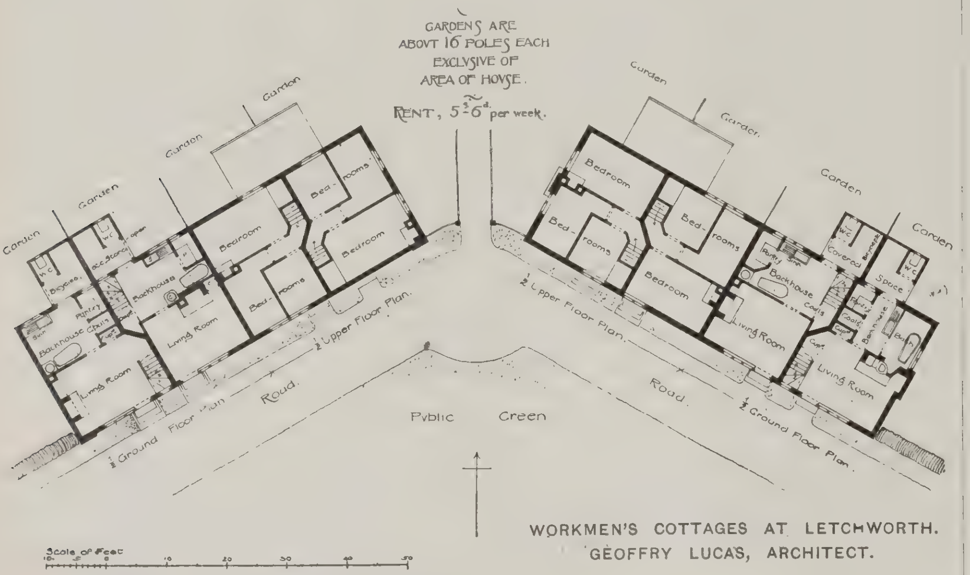
The figure of "Victory" on the Victoria Memorial will probably be of bronze gilt, while the rest of the work will be of white Carrara marble, the figure of the late Queen being 13ft. high. (Page 120.)

In a paper on country houses which he read before the Architectural Association last Friday Mr. J. Osborne Smith said that architects should "design in beauty and build with truth," but there was no reason why truth should take the form of twisted pipes over the fronts and roofs of their buildings. Speaking of sanitary fittings, he said a pedestal closet should be of the wash-down type, not the "wash-out"; urinals should always be avoided in houses, as they were a nuisance at best—the outlet usually supplied with them (in one piece of fireclay) was almost useless. Traps from lavatory basins should be of $1\frac{1}{4}$ins. diameter, while those from baths and sinks (except scullery sinks) should be of 2ins. diameter; scullery sinks should be $3\frac{1}{2}$ins. at inlet. (Page 115.)

The air in the House of Commons is now washed by a new type of water screen, a much more powerful intake fan has been erected, and the passages joining the main airways are more effectively isolated than they were. Further tests are to be made. (Page 118.)

Bitumen. FROM time to time a feeble protest is made against the flagrant misuse of the terms bitumen, asphalt and asphaltum—generally by some engineer or architect who has found himself deceived in a material he has used or contemplates using. It cannot be gainsaid that more often than not the misapplication of the terms is part of a scheme of deception by which manufacturers and others hope to conceal the real nature and composition of the article they have to sell. Such deception is greatly furthered by the ignorance of engineers and architects, who should at least make themselves cognizant of the materials they employ. But at present we find included under the generic term of asphalt a whole host of materials, good, bad and indifferent, many of which have none of the attributes of true bitumen or asphalt, and whose use must be inimical to the works upon which they employed, and to the reputation of the exceedingly useful natural material whose name they have usurped. Asphalt is of course closely identified with bitumen, its chief constituent. Bitumen, as is perhaps known, is one of that subtle family, the petroleum hydro-carbons, the vagaries of which are not yet properly understood, but which present an increasing scale of viscidity, from marsh gas (observable by stirring up most stagnant ponds) through naphtha, petroleum, to bitumen, which last is found in three states, either as liquid-pitch or maltha, "live" or semi-liquid pitch, or as solid "glassy" or "glance" pitch. Examples of these three states are found in many parts of the world, notably in America, which is rich in hydro-carbon deposits. For the origin of bitumen there are two theories, both having a considerable body of adherents. The first regards bitumen as an ultimate distillate of vegetable and animal remains; but when one considers the relatively minute amount of pitch in either a body or a tree compared with the immense deposits of hydrocarbons that exist in, say, the Caucasus or Philadelphia, one has to presuppose the previous existence of men and trees in unthinkable quantities. But the deposits of petroleum are below the coal measures, of admittedly vegetable origin. No valid reason has been adduced for these two different products from the same material. Further, no explanation has been given why hydro-carbons are found in such quantities in some places and not at all in others. We are inclined to pin our belief to the second theory, that of Mendéleeff, the celebrated Russian chemist. This supposes that during the upheaval of the mountain ranges great volumes of water poured down the crevasses in the mountain slopes, and reaching to the heated metallic kernel of the earth (iron carbide) set up chemical action, forming iron oxide and the petroleum hydro-carbons. The latter would probably be in the form of naphtha. An illustration of this action is afforded by the recent terrible catastrophe at Martinique. We have the evidence of eye-witnesses that the first manifestation was the sea running right back from the land; the water no doubt disappeared down a chasm in the sea floor. This was immediately followed by the blowing up of the volcano and the overwhelming of St. Pierre by a rain of fire; doubtless the intrusion of the water resulted in violent chemical action, forming naphtha, blowing up the mountain and precipitating a rain of burning naphtha over the unfortunate city. The Mendéleef theory is supported in several different ways. First, the principal bituminous deposits are found in the immediate vicinity of mountains, particularly those of volcanic origin. Secondly, all natural bitumen contains sulphur, which is not found in the artificial pitches. Thirdly, many of the deposits of "glance" pitch in the United States, such as "albertite," "gilsonite," &c., are found in such positions as to confirm the Mendéleeff theory that they were concomitants of volcanic action. "Gilsonite," for instance, is a pure black glassy-looking bitumen (95 to 98 per cent. pure) found in Utah as veins in the hard rock, having been forced up into the natural cracks and fissures, which it has completely filled. Some of these veins are 10 miles in length, and vary from $\frac{3}{16}$in. to 18ft. in thickness. Of the "live" deposits of bitumen the most famous is the Trinidad Pitchlake, in extent about 110 acres. The Bermudez lake in Venezuela has an area of over 1,000 acres. Both lakes are very similar in appearance. They have shifting pools of water, low vegetable scrub and small trees on the surface. The pitch is a chocolate-coloured earthy-looking substance. In the centre of both lakes it is soft enough to show foot prints, and may be too soft to walk on in hot weather. At the sides the pitch is hard and blacker. In both lakes the material moves or flows, any holes made in the surface being filled up from the sides. The pitch is dug with pick and shovel. There are differences between the deposits, however. The Bermudez is much purer than the Trinidad pitch, but not so stable. The latter is emulsified with water and has a considerable percentage of impurity—about 50 per cent.—mainly consisting of fine clay and vegetable ash from the vegetation on its surface. The Bermudez lake is more liquid; it has several liquid pitch or maltha springs, the largest being 7 acres in extent. So far we have only touched on the origin of bitumen; in a future note we shall deal with its connection with asphalt.





WORKMEN'S COTTAGES AT LETCHWORTH.
GEOFFRY LUCAS, ARCHITECT.

COTTAGES AT LETCHWORTH.

THESE eight cottages for the First Garden City, Ltd., have been built at Letchworth, on the company's estate near Hitchin, in Hertfordshire. The contract amount was £1,510 (including drainage and £10 for contingencies). This is at the rate of £188 15s. per cottage and works out at 5¼d. per foot cube. Each cottage has 16 poles of garden ground adjoining, and the average rental is proposed to be 5s. 9d. per week. The cottages face on to a small common green. The accommodation provided in each cottage consists, on the ground floor, of a living-room 14ft. 4½ins. by 11ft. 3ins. and a back house 10ft. 6ins. by 9ft. containing copper and sink; also a china cupboard, coal-house, pantry, covered space and w.c. Upstairs each cottage has three bedrooms, the largest of which is provided with a fireplace, the other rooms having ceiling ventilators. One of the cottages is fitted with a patent range with copper and bath, presented by Councillor James Cornes, of Leek, and it has been decided to provide baths in the other cottages at a slight addition to the contract amount. The materials employed are local red bricks for facings, lias-lime rough-cast for the upper storeys, and red-tiled roofs with half-round ridge tiles. The outbuildings are of Stockholm tarred weather-boarding. The cottages were erected by Messrs. T. Raban & Sons, contractors, of Baldock, Herts; Mr. Geoffry Lucas, A.R.I.B.A., of 2, Vernon Place, Bloomsbury Square, W.C., and Bancroft, Hitchin, being the architect.

ELECTRIC HOISTS AND DERRICKS FOR BUILDING OPERATIONS.

By E. Kilburn Scott, A.M.I.C.E.

WHILST in Philadelphia recently the writer saw some electric hoists and derricks in use on the new Wanamaker skyscraper building, now being erected. The noiselessness and rapidity with which they worked was remarkable, and not the least pleasing feature was the complete absence of smoke and steam, which are necessary accompaniments of small steam engines and boilers. No one ever thinks of testing such engines, but they would probably run quarry-winding engines a close race as the most wasteful in the world. On the other hand, an electrically-driven hoist has the following advantages:—

(*a*) The electric motor being essentially a high-speed machine, it is therefore easy to attain a high speed of wind with a minimum of gearing.

(*b*) As the electric motor has no dead centre, it starts with the same torque whatever the position of armature, and consequently there is no jerking of the load.

(*c*) The regulation of an electric motor is under the most perfect control, and by the use of a water resistance the current can be adjusted to such a nicety that a piece of masonry or a girder may be settled down as gently as a feather.

(*d*) In case a stone requires slewing round slightly, the electric motor can be rotated just sufficient to take the weight, so facilitating the setting. (The chances are that a steam hoist would shoot it up several inches.)

(*e*) The electric motor forms an integral part of the hoist or derrick and is moved about with it with the greatest facility. On a very high building current is taken up to the motor by a light insulated cable, whereas to lift coal up to a steam boiler is both objectionable and costly; consequently the steam plant is usually in the basement and the progress of the work is not so great, by reason of the driver being away from where the material is delivered.

(*f*) An electric motor is absolutely unaffected by frost, snow or rain when it is completely enclosed. Indeed, on the top of a building and in the open it is working under less onerous conditions than the motors of a tramcar, which travel all day within a few inches of the mud and slush of a street. In cold weather a steam crane has considerable condensation, and under certain circumstances cannot be worked at all.

(*g*) The skill required to work an electric hoist is less than that for a steam hoist, with its boiler, pump and engine, &c. When work is over for the day an electric motor does not require any more attention than possibly occasional renewal of brushes, or oil on bearings. Again, in starting up in the morning there is no time lost, as is the case with a boiler, which must have fires lighted, steam raised, engine warmed up, &c. The electric motor can be switched right into its work directly the 6 o'clock bell goes.

(*h*) There is no insurance to take out with an electric hoist, whereas a boiler must not only be insured but also officially inspected regularly. Even so, there is considerable danger with such small boilers.

(*i*) Water is apt to give trouble with steam hoists because it may not be good enough for boiler purposes by reason of depositing scale; whilst if the crane is at an elevation the water must be taken up to the boiler in buckets, which is a nuisance. In an electric hoist the resistance may be all metallic, but even if water resistances are employed a bucketful a day is enough and any town's supply will do, even if it is hard.

(*j*) The electro-magnetic brake is at once the simplest and safest of any form of brake. It comes into action directly current is cut off or anything goes wrong, and the safety of the thousands of electric lifts, hoists and cranes in buildings is a testimonial to its certainty of action.

(*k*) The running cost of an electrically-driven building crane or hoist is bound to be less than steam, for the same reason that electricity has ousted all other methods of driving overhead travellers. So much is this so that crane makers have practically stopped making any type except electric.

(*l*) One very useful feature of electric hoisting apparatus is that for lifting iron or steel an electro-magnet can be employed instead of hooks and chains. In this way anything made of iron or steel can be handled quickly

with a minimum of labour, as is the case in engineering and steelworks. For buildings erected on the steel-skeleton plan the electric magnet should be very useful.

One could go on giving other advantages of electric-driving and disadvantages of steam, but surely sufficient has been stated to convince the most sceptical.

The question may be asked, Why then do not the large building firms adopt electric hoists? Well, as a matter of fact all the most up-to-date firms in the States and Canada have done or are doing so, and directly others know the results they will follow suit. Of course, in all businesses there are fossils—men who prefer to jog on in the old groove until one day they are rudely awakened by finding themselves without work.

One thing it is important to mention is that electric hoists are not cheap, but then no good thing is cheap. Surely builders know this better than anybody. When comparing costs they must take into account not only the first cost but also the running cost as well. If the saving per annum given by an electric hoist over a steam hoist is capitalized, it will be found to pay for the plant many times over. This is practically true for any form of machine which is worked intermittently, otherwise why should every engineering firm of any standing in this country and abroad have adopted electric-driving?

In future every contractor for an important building should make it a point of first arranging for a supply of electricity from the nearest electric-power mains. It is no more difficult to give a supply to a building in course of erection than it is to a completed building, and electricity-supply engineers are only too anxious to increase their motor load.

A standard tramway type 25-h.p. motor, when connected to a winch through double reduction gearing, is capable of lifting 1,800 lbs. at the rate of 150ft. per minute, and it will do it day in and day out for ever without winking and at a cost of about one-third to one-half that of a steam hoist for similar service. Such a hoist is at work on the Lawyers Title Insurance Co.'s building, 37, Liberty Street, New York, the current being supplied by the New York Edison Electric Light Co.

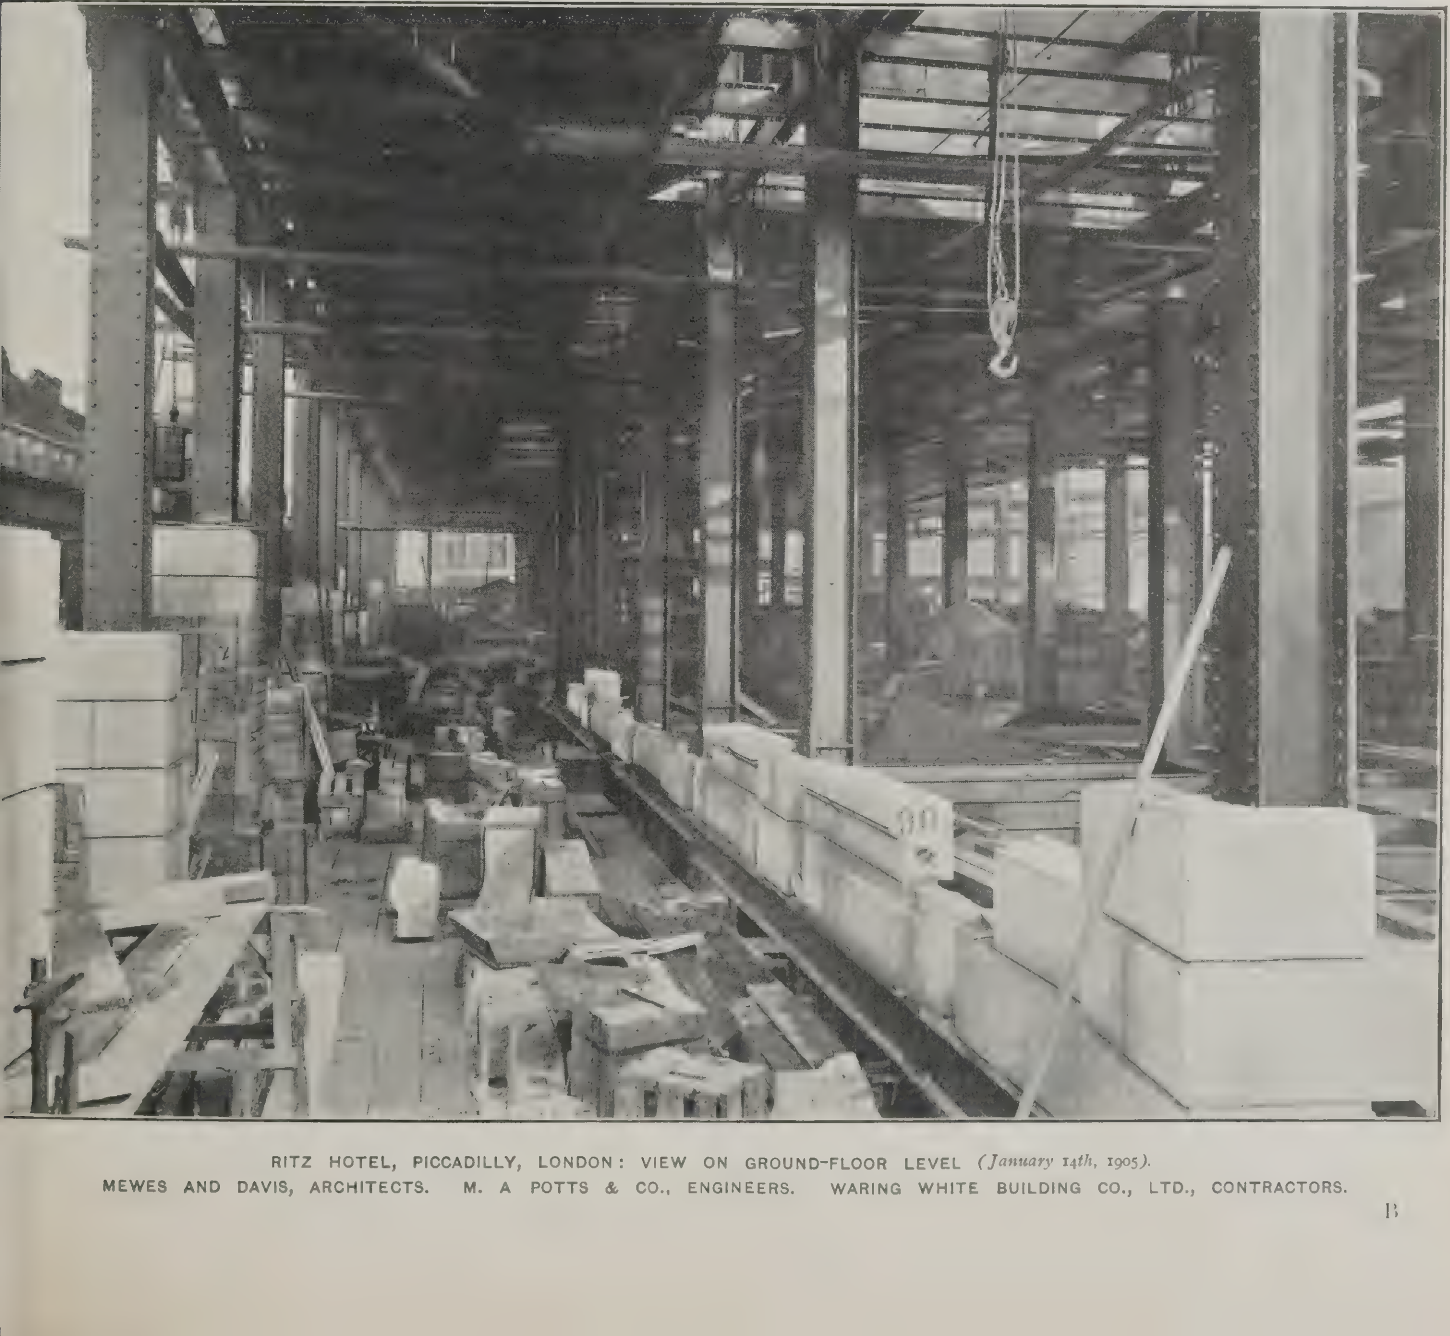
Electricity can of course be used to great advantage in other ways; thus for clearing water out of foundations a centrifugal pump driven by an electric motor makes an ideal arrangement, as they are both essentially high-speed machines, and when coupled are certain in action, take up little room, and are remarkably cheap.

Then when the time comes for finishing off the building, electric floor planers and floor polishers will save a vast amount of labour.

For carpentry work electric glue-pots are quite the thing, and in the case of a very large building there is no reason why the temporary workshop should not be electrically driven.

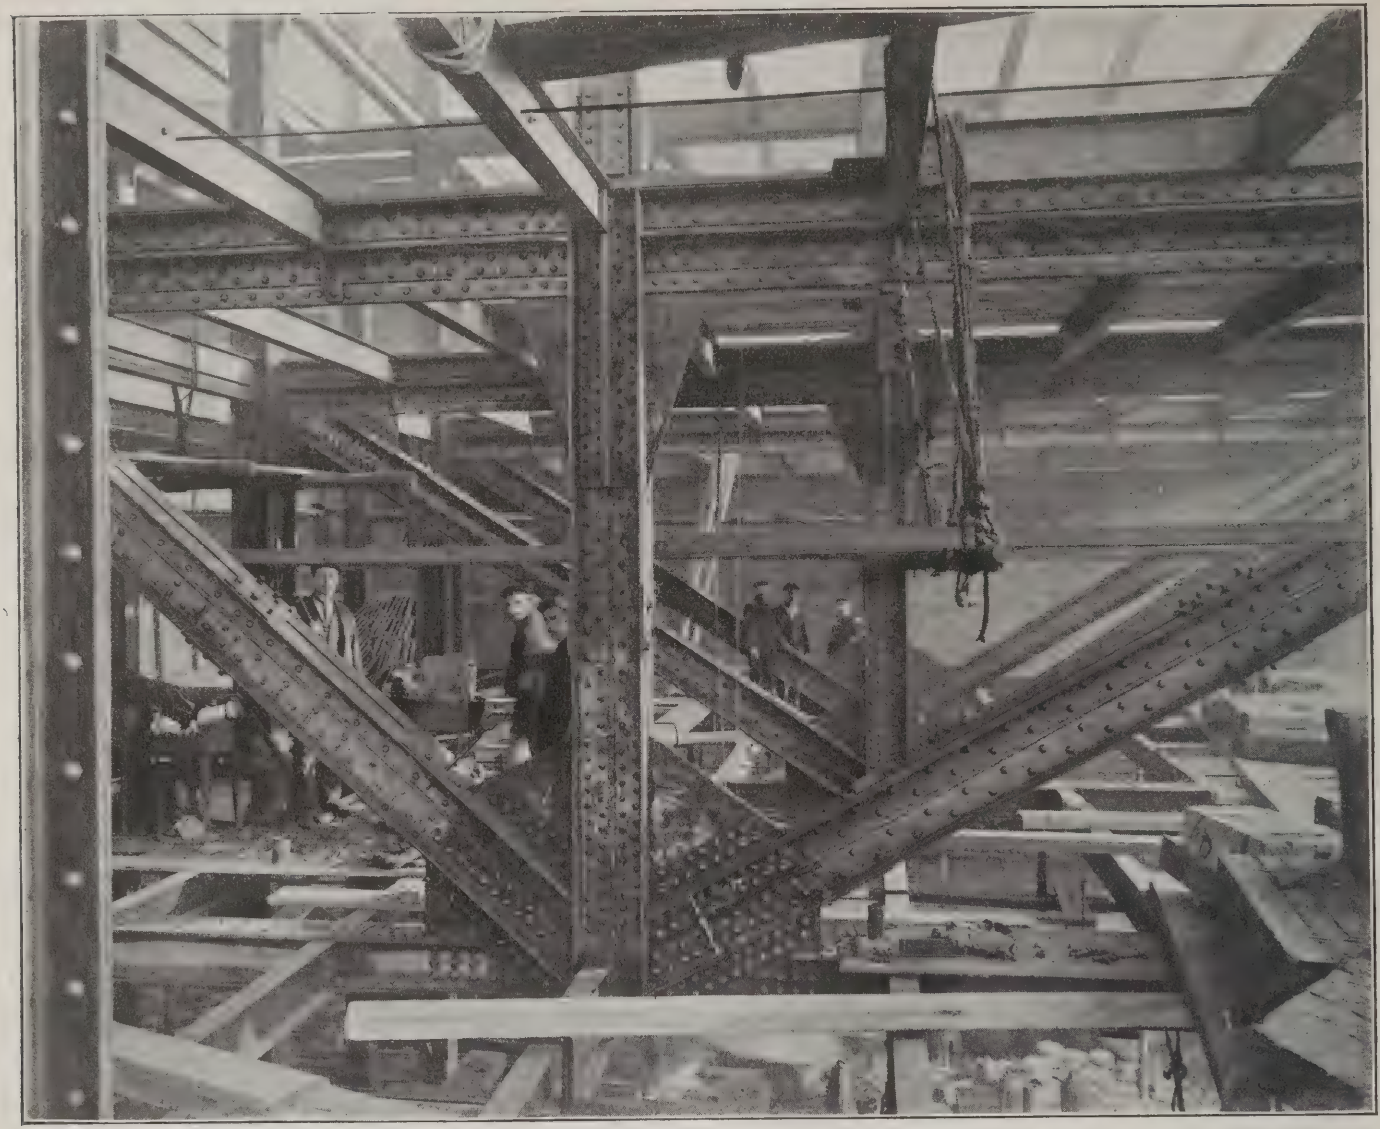
THE RITZ HOTEL.

THIS week we publish a further series of photographs showing the erection of the Ritz Hotel, next the Green Park, Piccadilly, the rapid growth of which has been the subject of keenest interest for months past. By reference to the centre plate in this issue it will be seen what a wonderful change has taken place in the erection of the steelwork since December 19th, the date on which the first of the present series of photographs was taken. The steelwork was then at second-floor level. A month later the framing for the fourth storey was completed and the filling-in of the lower floors was making decided progress. It will be noticed too that our photograph shows a pile of centerings for the ground-floor arches. Attention is also directed to the American cranes (full particulars and detail views of which were given in our issue for November 30th last): in the view taken on December 19th one of these cranes is seen reaching up from ground level; by January 14th it had been raised to second-floor level and another similar crane had been fixed on the front of the steelwork at first-floor level, for convenience in handling materials on to the floors: stonework was then being brought on to the first floor, for, as the view on this page shows, the encasing of the steelwork was well begun by that date. Turning now to the photographs taken on February 1st—about a fortnight later—we



RITZ HOTEL, PICCADILLY, LONDON: VIEW ON GROUND-FLOOR LEVEL *(January 14th, 1905).*

MEWES AND DAVIS, ARCHITECTS. M. A POTTS & CO., ENGINEERS. WARING WHITE BUILDING CO., LTD., CONTRACTORS.



RITZ HOTEL, PICCADILLY, LONDON: DETAIL OF TRUSSES OVER RESTAURANT AT WEST END.

see the steel skeleton being extensively filled in and very great progress made on the Arlington Street front; while the view taken three weeks later, namely, February 21st, shows the work reaching up to the seventh floor, the stone arcade completed, and the whole structure assuming immense proportions. The photographs indicate very clearly the general methods adopted, and we need only mention one or two matters which may pass unappreciated. Of the encasing of the steelwork we have already spoken briefly in connection with the view on the preceding page. In the centre plate the detail photograph taken on February 1st shows how the brickwork and stonework are built on to one another and tied together, and how the expanded metal (to afford a key for the plastering) is stretched across the face of the stanchion and tucked into the brickwork. The detail of the steelwork at the back of the hotel, taken on February 21st, shows one of the steel chimneys in course of erection. The photograph reproduced above is a particularly interesting one. It shows the bracing of the steel framework at the end next the Green Park. The reason for its design lies in the fact that the large room below is to be entirely free of obstructions, so that in this case the ceiling has been suspended.

In our next article we shall publish full particulars of the steelwork, with drawings of representative built-up pieces and a further series of views showing the erection of the hotel up to date. The work already done has been most instructive, but that yet to be done promises to be even more so.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Space in Lecture-room.

Havant.—H. J. W. writes: "What space per ft. super. should be allowed per person in a lecture-room?"

About 5ft. super. The London County Council regulations for theatres should be worked to in this respect.

Gallery Cantilever.

Replying to the correspondence on this subject, Prof. Henry Adams says: "The solution proposed by 'J. B.' on p. 88 of your issue for February 15th does not take account of the fact that the front or cantilever portion of the gallery will frequently have the full external load, while the back or horizontal portion has none; this will make it necessary to do all the holding down at the wall end, whence $\frac{10 \times 6}{11} = 5{\cdot}45$, say $5\frac{1}{2}$ tons anchorage capacity, as given in my reply. The weight on the column under these conditions would be $6 + 5\frac{1}{2} = 11\frac{1}{2}$ tons. When the whole girder is loaded the stress on the wall-hold is reduced, but the load on the column is increased, and to be exact the figures should then be taken as given by 'J. B.,' but I treated the question from a practical point of view, and not as an examination question. At the same time I endeavoured to show by graphic diagram the nature of the stresses induced, upon the basis of $15\frac{1}{2}$ tons on the column, as otherwise a design might have been prepared with the cantilever in two pieces, with merely a joint-plate over the column. With regard to the remarks by 'K. P.', the whole of the 4 tons *when it is there* will act in opposition to the 6 tons."

Reconstruction of Drainage System.

London.—J. E. C. writes: "(1) I have to reconstruct the drainage of a house, and owing to the sewer being very shallow in the road I have to build up piers 20ins. high in the cellar to carry pipes in order to get the required fall, namely, 3ins. in 10ft. Can the Council's surveyor compel me to fill in under the pipes with a bed of concrete, as well as brick piers 14ins. by 14ins. at every joint?—4in. L.C.C. iron drain pipes are to be used. (2) I have also to reconstruct the drainage at a house No. 1, where at present the main runs into the next house No. 2, the branches of No. 1 being connected up at the back of No. 2 and then running through into the sewer. Are the Council supposed to put the drain right which runs through the house and let me connect up to it at the back, as before, or to put a separate new connection to sewer free of charge?"

(1) Yes. Personally we should prefer the brick piers alone, as any leak in the pipes would immediately disclose its presence. But the surveyor is within his rights in ordering concrete. (2) It is a little difficult, without more precise information, to answer this kind of question offhand. If houses No. 1 and 2 belong to different owners, then the drain running through house No. 2 is a sewer from the point where the drain of No. 1 enters it, and is repairable by the authority from that point. But it may only be a "combined drain"; your letter does not state the date when this drainage was carried out, or whether it was done under an order for "combined drainage" or not.

Road Surveyor in Partnership with Contractor.

Referring to the enquiry and answer under the above heading on p. 87 of our issue for February 15th, "A Cleethorpes Councillor" writes: "I do not know what kind of a report your correspondent sent you, but the particulars in the paragraph are altogether wrong, and for the following reasons:—(1) The contractor in question has not at any time made any streets or roads for the council. (2) Any roads that the contractor has made have been for private parties who have had their own surveyor, who has supervized the works, and on completion the roads have been cut open and the highways committee have inspected the section, measured the depth of materials and satisfied themselves that the roads have been made to the council's requirements. (3) The contractor has not stated that the council's surveyor was a partner in road-making at Cleethorpes; in fact, at the contractor's last examination his solicitor stated most definitely that the contractor denied that the surveyor was or ever had been a partner (see report in 'Grimsby News' of February 3rd, 1905). (4) The true statement of the case is that up to two years ago the council's surveyor carried on a private practice, and in that capacity was engaged by the contractor to take out quantities and price his tenders; and on the contractor obtaining the work he set out the works, and there his duties ended, for the surveyor engaged by the owners of the land then had charge."

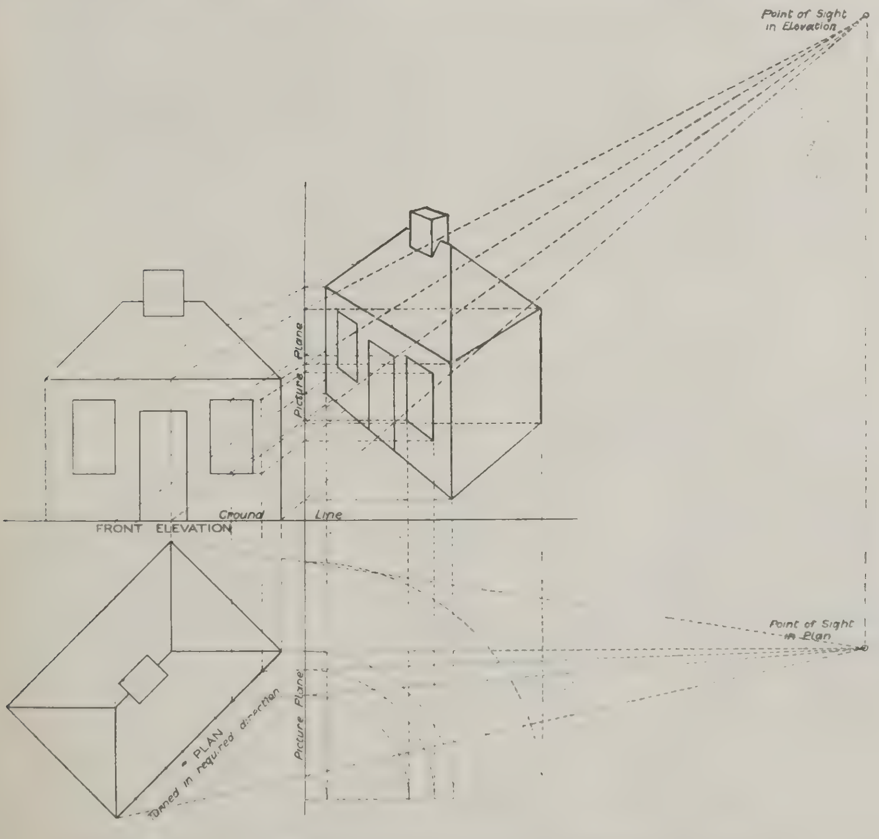
We are glad that our correspondent's letter puts such a very different complexion on the matter in question. Our previous correspondent backed his statement by a local newspaper report which he enclosed. It was obviously impossible for us to comment upon such slender corroboration.

Bird's-Eye Views.

Wood Green.—B. S. writes: "Please give the rules for a 'bird's-eye view'."

A bird's-eye view is subject to the same general rules as other perspectives, the point of sight being taken where desired. The subject may be studied from Middleton's "Principles of Architectural Perspective" (2s. 6d. nett). The diagram below shows the development of a bird's-eye view from orthographic projection. The front elevation is used to give the heights of the various parts, but the projectors to the point of sight must be drawn from where these heights would have been if the elevation had been drawn to correspond with the plan. The dotted construction lines have been shown complete for one window and the main outline. The principle is so simple that probably no further explanation will be necessary.

HENRY ADAMS.



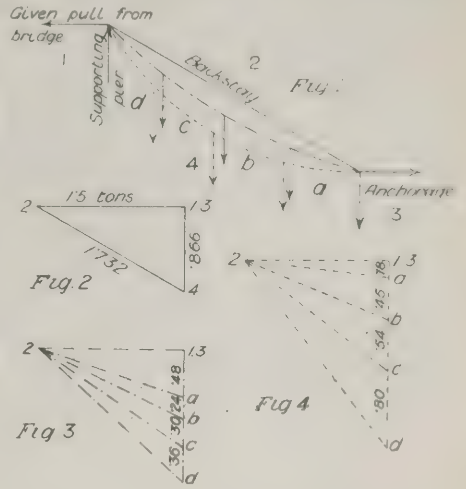
DEVELOPMENT OF BIRD'S-EYE VIEW FROM ORTHOGRAPHIC PROJECTION.

Backstay of Suspension Bridge.

Bradford.—Hydraulics writes: "Does the weight of the backstay of a suspension bridge increase or relieve the pull on the anchorage?"

The weight of the backstay of a suspension bridge forms part of the general anchorage or resistance to the pull of the suspension chains. A diagram will make this clearer. In Fig. 1 the full lines show a backstay without weight, and therefore able to be pulled straight. To the left are shown the supporting pier and the pull from the suspension chains, taken as vertical and horizontal for convenience. To the right are shown the anchorage forces, which may be taken as horizontal and vertical or by their inclined resultant. The spaces are now numbered to enable a reciprocal diagram to be set off, as in Fig. 2. Take the horizontal pull of the bridge as 1½ tons; then the horizontal pull at the anchorage will be the same, and the backstay being inclined at 30 degs. the load on pier will be ·866 tons and the upward pull on anchorage will be the same amount, the tension in the backstay being 1·732 tons. As this latter, of whatever material it be made, must have weight, it cannot remain in a straight line, but will take a parabolic curve. With only a slight dip this will be approximately the same as a circular arc. Draw an arc as in stroke and dot line, Fig. 1, divide it into any number of equal parts, marking the spaces *a b c d* in place of the single figure 4. Now for the stress diagram, Fig. 3; keep the horizontal pull 1-2 as before = 1½ tons, and from point 2 draw lines parallel to the chords of the arcs in Fig. 1, meeting the vertical from point 1 in *a b c d*. Then 1*a*, *ab*, *bc*, *cd* are the loads that must be hung on the backstay (or the weight of the backstay itself) to maintain the same horizontal pull. It will be seen that the vertical component of the anchorage is reduced, but the load on pier is increased. Now it is clear on studying the design that if we have a heavier backstay we must give it a greater dip in order not to increase the horizontal pull, proving that the weight of backstay must be taken into account, together with its curve, in designing a suspension bridge. For further proof add the dotted curve to Fig. 1, and draw stress diagram Fig. 4, showing that heavier weights must now be suspended from the chain in order to give the same horizontal pull, and it will also be seen that when the tangent to the lower end of the curve is horizontal, the whole of the vertical component of the anchorage disappears. In conclusion the short answer to the question is that the weight of the backstay relieves the pull on the anchorage.

HENRY ADAMS.



Measurement of Stonework and Woodwork.

X. Y. Z. writes: "I have a quantity of circular stone and woodwork on a job, and I understand the measurements should be taken from the sizes from which the material could be worked. The architect, however, has deducted all corners and lump waste from the measurements. Does the following clause in the 'preliminary' of his quantities save him and debar me from charging extra?—'Contractors are to accept these quantities as the method adopted by the architect, and no extras will be allowed for any different mode of measurement.' Sketches sent (not reproduced).'

If the stone corbel and the cornice over pier are each in one stone, you are perfectly correct in your contention. With respect to woodwork, it is usual to measure this nett in most cases, but a dimension of "raking cutting waste" or "circular cutting waste" is taken. It would, however, occupy too much space to go fully into the question of woodwork to cover all phases of the question. It is rather unfortunate that you have signed a contract containing a clause such as you quote. Another question is as to whether the quantities form part of the contract, or whether the price was given simply according to the drawings and specification. In any case I very much doubt, with respect to the stonework at least, whether the architect would find any judge who would give a judgment in his favour, in view of the absolutely childish incompetence displayed here. Whatever "method" may be "adopted by the architect," he is expected to show at least some rudimentary knowledge of measurement, and would hardly be allowed to screen his incompetence by such an extraordinary clause (both grammatically and in substance) as he has thought fit to insert. Had he given some indication as to the method adopted either by an explanation of his deductions, or had he referred to any local practice in which such a method was adopted, it would have been on a different footing.

W. E. D.

Value of Land in Westminster.

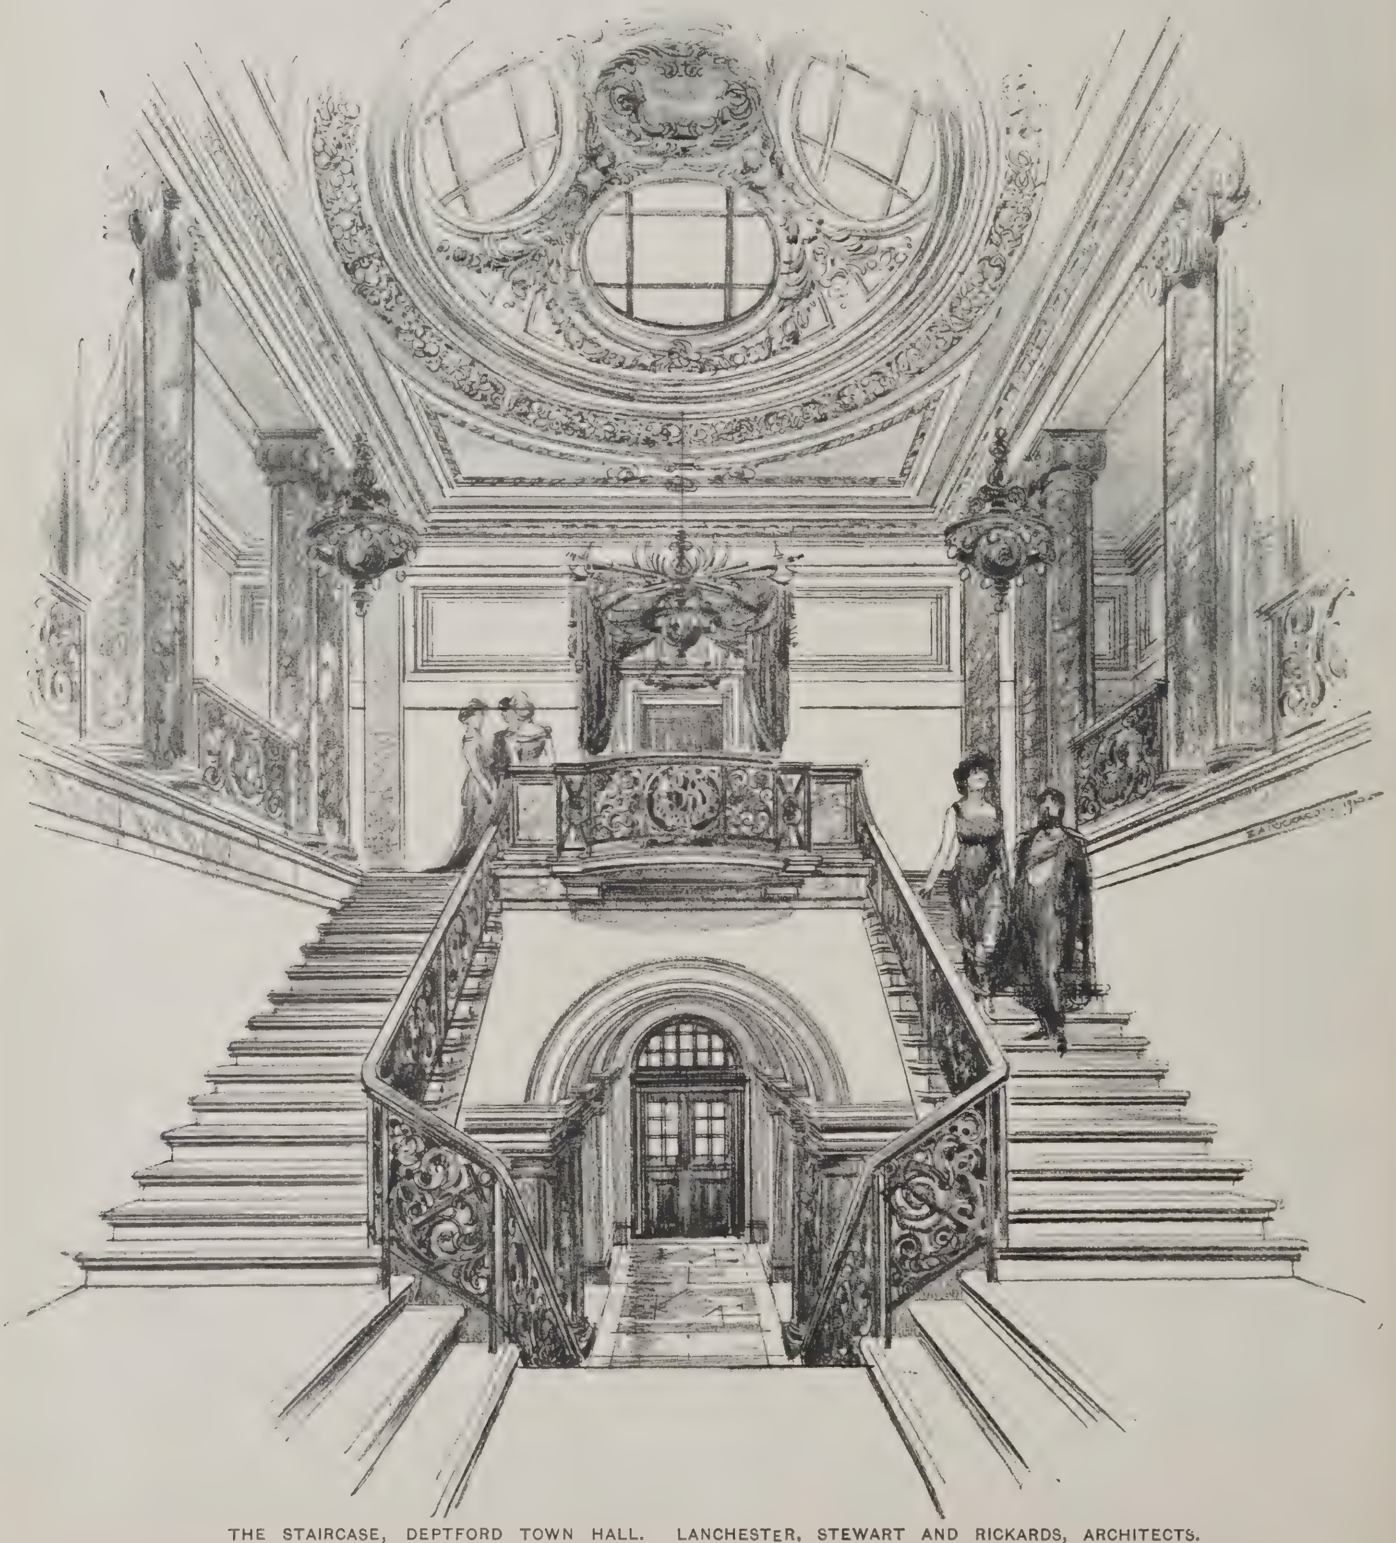
Brockley.—J. F. S. writes: "What is the approximate value of land per square foot in Westminster? The site I have in mind is a corner one of an area of about 2,500 sq. ft. and within three minutes' walk of Victoria Street."

On the particulars stated it is absolutely impossible to give any reliable information. A stone's-throw between two sites both answering the description given would frequently make a difference arrived at by multiplication. W. E. D.

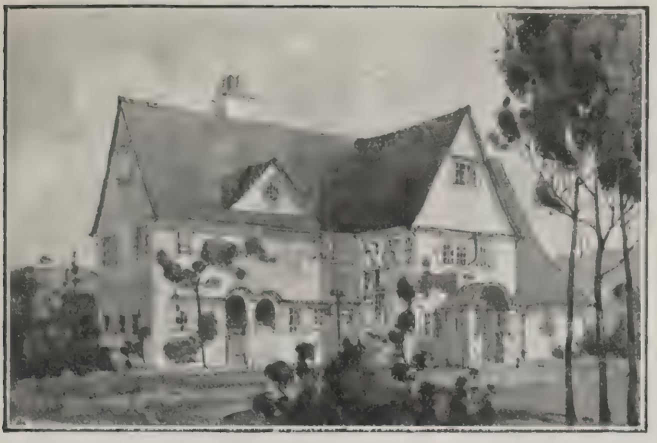
Measurement of "Fair Cutting" to Brick Arches.

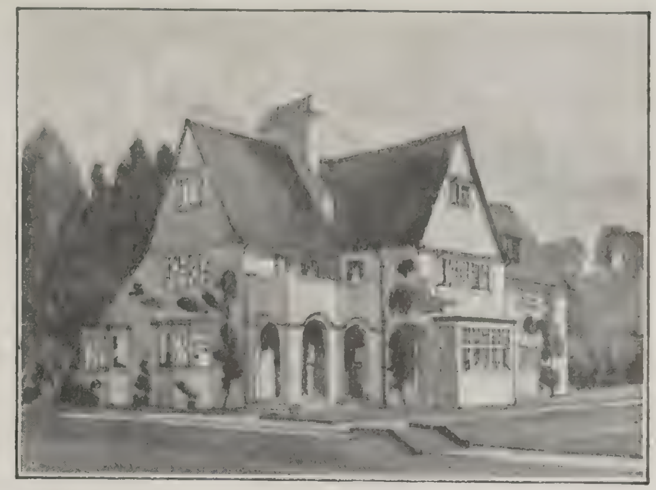
Watford.—Rex writes: "Kindly explain the method of measuring 'fair cutting' to brick arches—gauged segmental and semicircular—including skewbacks, at per foot super."

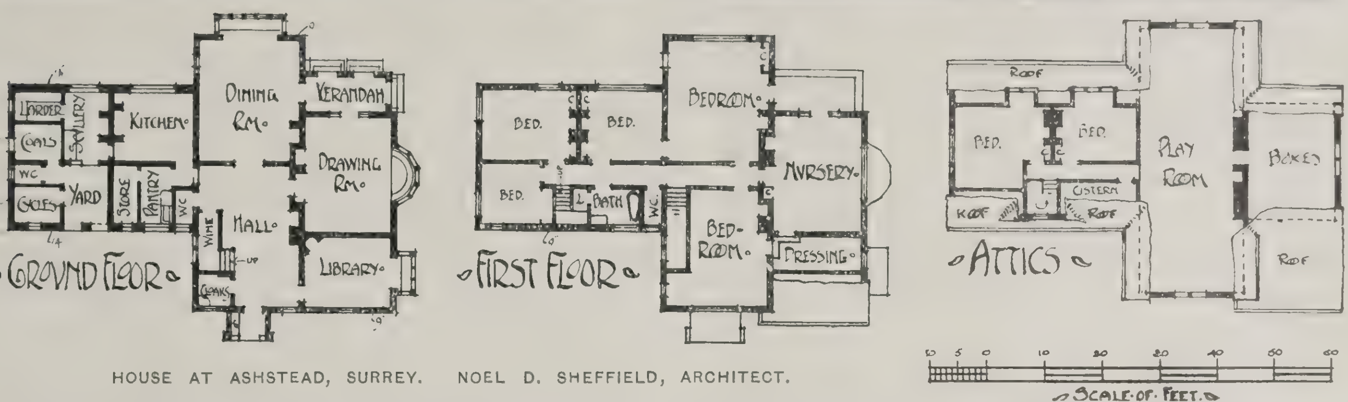
You somewhat complicate the question by practically answering it yourself, though your answer is contrary to the usual practice. "Fair cutting" in facings is usually taken per foot run, which is considered to cover $4\frac{1}{2}$ins. into the wall, any cutting beyond this being "rough." The cutting to the back or extrados of a segmental or semi-circular arch would be described as "circular cutting waste." To a flat arch there would be no cutting on the back: that to skewbacks would be described as "skewback cutting waste"; the sight length in each case being measured and the facing in which the cutting occurs (not the arches) described. W. E. D.



THE STAIRCASE, DEPTFORD TOWN HALL. LANCHESTER, STEWART AND RICKARDS, ARCHITECTS.







HOUSE AT ASHSTEAD, SURREY. NOEL D. SHEFFIELD, ARCHITECT.

This house has recently been erected by Messrs. Gathercole Brothers, of Norbury, from the designs and under the supervision of Mr. Noel D. Sheffield, of Finsbury Square, E.C. The iron casements and leaded lights and the hot-water heating were executed by Messrs. Wenham & Waters, of Croydon. External walls are white rough-casted, with stone dressings to the windows, porch, &c. The roofs are covered with red Reading tiles. All external paintwork is of a bright green colour.

THE ARCHITECTURAL ASSOCIATION.

Mr. Osborne Smith on the Sanitation of Country Houses.

A MEETING of the Architectural Association was held on Friday evening at 18, Tufton Street, Westminster, the chair being first occupied by the president, Mr. E. Guy Dawber, F.R.I.B.A., and afterwards by Mr. James S Gibson, F.R.I.B.A.

Messrs. R. Frank Atkinson, H. Bernton-Benjamin, J. A. Bessant, W. Bouser, R. W. Burrows and F. C. B. Dabbs were elected members of the Association.

The following further donations to the Building Fund were announced :—

	£	s.	d.

Mr. J. Osborne Smith, A.R.I.B.A., then read a paper on "Country Houses and Accessory Buildings," confining himself practically to the sanitation of such buildings.

Architects, said the lecturer, should "design in beauty and build in truth," but there was no reason why the beauty of their design should be marred by truth taking the form of twisting pipes over the fronts and roofs of their buildings; for careful arrangement in planning would obviate this by placing the sanitary fittings in such positions that their necessary pipes could be fixed practically out of view and yet be quite accessible in case of need. This was more easily effected in new buildings than in old ones, yet in the latter the unsightly lines referred to could usually be modified by judicious arrangement without in any way affecting the thoroughness and efficiency of the work.

Water Supply, Cisterns, &c.

Having satisfied ourselves upon the purity and quantity of the water supply—from collecting ground, wells, or town supply—the next consideration was its storage. It might be stored in a reservoir or underground tank, which must be very carefully formed with sound brickwork upon a concrete bottom, and covered in by doming, arches or concrete and iron; the bottom being formed with rounded angles to facilitate cleaning, and the whole of the inside surface rendered and smoothly trowelled in cement. There should also be clay puddling around the outside and over the top, while the opening for access must stand well above ground to prevent surface-water finding an entry. Frequently the situation would not allow of this form of main storage tank, when it might be necessary to build a water tower and allow the water to supply the cisterns in the house, stables, laundry, &c., by gravitation, or otherwise pump direct to the storage cisterns in the buildings, which frequently meant very heavy work for the pumps, owing to long horizontal pipes. Overflows, which should be as short as possible, needed to be provided to all tanks and cisterns, and not be connected to drains.

Storage cisterns inside the building might be of lead, galvanized iron or enamelled fireclay. They should always be provided with a movable cover and be placed in a clean accessible position.

Baths.

The bathroom should be large, light and airy, with cross-ventilation, and the walls and floors formed with impervious material. If of wood, it should be covered with lead. Perhaps the nearest attempt to an ideal bath was the latest pattern independent copper bath, made of copper with roll edge and strong supports or feet; the outlet was at the end, where it should be, and not in the centre, as usual in copper baths, and had large pillar cocks and standing accessible overflow, quick waste and trap. At the end was a plate-glass screen on three sides, behind which were the various plated pipes for shower, spray, wave, douche, &c. The next best type was a first-quality white enamelled cast-iron bath, with roll edge, quick accessible waste and overflow combined, without casing, the outside being decorated in harmony with the room. Glazed fireclay was perhaps the most durable and sanitary material for baths, but owing to its great thickness a bath of this material was very heavy and required to be warmed with hot water when not in constant use.

The noise frequently experienced when the bath was emptying might be checked to a great extent by providing ventilation to the waste pipe, although this retarded the velocity of the discharge.

Speaking of pipes, Mr. Osborne Smith emphasized the importance of fixing every pipe on the surface of the walls, not buried in them. Chases were sometimes advisable, but they should be regarded as recesses in the walls and be rendered in cement or otherwise lined with impervious material to match the wall surfaces, and covered with movable casing.

The linen cupboard might, with advantage, be formed somewhere near at hand, so that the hot-water pipes might, on their way to the bath, be used to keep the linen aired by passing through the cupboard.

Water-closets.

These should not be in the bathroom, nor should access to them be from a bathroom but from a ventilated lobby common to both. Neither was it advisable to have a lavatory basin in the water-closet. The walls and floors and ventilation described for bathrooms applied equally here. Carpets should never be used, a loose mat being far preferable. A pedestal closet should be of the wash-down type, not "wash out," in one piece of fireclay or similar material, strong and neat in appearance, with accessible joints to soil pipe, and no recesses in which dirt might accumulate; the flush pipe from the cistern should discharge vertically into a socket provided at the back, without india-rubber cover, and with two gallons of water should thoroughly wash the inside of the pan and replace the whole of the contents of the trap with clean water. The larger the water area, the less liable was the pan to become foul, but beyond a certain point the contents could not be efficiently removed except by syphonic action. Closets without air-pipes and puff-pipes in the cisterns, but having a second trap, were to be preferred; the simpler the apparatus the better.

Various means for discharging flushing-cisterns for wash-down closets had been devised. Besides the simple pull, there was the push valve, to release confined air and allow the syphon action to start, or to compress air and thus drive the water over the syphon to start it; there was also the plunger, the lifting valve, lifting drum, &c. The lifting valve to start the syphon was the simplest and generally most certain in action, and was passed by most water companies.

The flushing cistern might be of cast-iron, but should be galvanized to prevent rust; lead-lined or cast-lead cisterns were best (when the water did not affect the lead), but were most costly. Porcelain was also a useful and ornamental material. The flush-pipe of lead or copper should be as straight as possible and securely connected to the arm of the pan. India-rubber covers were not desirable for this joint.

Valve closets should be fixed within an enclosure, the floor lined with lead, and the walls and all inside the enclosure painted white. There should be a large supply valve, accessible overflow, and a puff-pipe to the open air from the valve box between the valve and the trap beneath. Slop tops, formed in one piece with the pan, assisted in making a draught-proof seat.

Valve closets required a separate supply cistern containing about 10 gallons.

Overflow pipes from cisterns and floors should not have flaps on their external end, as so often advocated; they invariably became set fast, either open or shut, and were then useless.

Urinals.

In a private house these should be entirely avoided; at best they were a constant nuisance and needed every care and attention, with abundant flushing. The outlet usually supplied with them—in one piece of fireclay—was almost useless.

Urinals should never be fixed on upper floors, as, unless careful attention were given to the fixing and the waste from them, they invariably leaked and caused trouble below. The weak points were naturally the joints; therefore the fewer the better; particular attention should be given to the joint between the urinal and the trap, which should always be formed with a large brass washer, fly-nut and union having a dome grating with bayonet joint.

Housemaid's Sink, &c.

There should always be a small room, with opening window, on each bedroom floor, provided with a slop sink, which should be fitted as a water-closet, with flushing cistern, &c., connected to soil pipe, and also a sink for drawing hot and cold water. The waste from the latter should discharge into an iron (not lead) waste pipe. The combination of these two sinks in one set, so common in makers' catalogues and exhibitions, was often unsuitable for the intended purpose, because the hot and sometimes boiling water produced injurious expansion in the soil pipe, with disastrous results.

The space under these sinks should be kept free from enclosures, and every facility given to minimize the difficulty of keeping these places clean. Above all things, linoleum should never be fixed under sinks; it invariably became wet and decayed.

The main water cistern should never be placed in this room, although it was not an unusual position to find it.

Kitchen and Scullery.

This department should have preferably a north aspect, lofty, well-lighted by windows reaching to near the ceiling. The walls and floors should be of impervious material, which might be readily cleaned. The sinks should consist of one or more for washing purposes, and might be of enamelled fireclay, with wire or teak grid-tinned copper or lead-lined wood sinks—each of which had its respective merits and defects. Fireclay sinks were cleaner than the others, but were easily damaged with saucepans, and were liable to break the crockery unless the grids were used. Copper and white-metal sinks were perhaps the best, but were expensive. While lead lined were very general, they were dirty and frequently needed repair, but were less destructive to crockery. Vegetable sinks should also be provided for washing vegetables, and were best of the deep enamelled fireclay kind, fitted with plug, grating and overflow, being much more easily cleaned than others.

All sinks should be supported upon cantilevers, and the spaces under should not be enclosed, although a guard-rail would be necessary to protect the pipes and traps from injury.

Teak sinks were sometimes used for washing-up purposes, but they needed constant cleaning to remove grease, &c.

Outlets from sinks should always be formed with large cobweb gratings. The trap below should be connected to the sink with a strong brass union, back-nut and lead-washer, instead of the spigot and socket with stoneware pipe so frequently met with in the cheaper class of sink.

Larders

should have a northern aspect, with abundant cross ventilation, and be near the kitchen, but not entered direct from it. Wire gauze (preferably of copper) should be fitted to the windows and secured to wood frames on hinges. Some larders were fitted with pickling troughs, with plug and waste; these, of course, should not be connected to a drain, neither should a gulley be in the floor. If drainage from the floor was necessary, it should be formed by connecting the floor to an outlet through the wall as short as possible and discharging upon the surface of the paving outside. Shelves should be of slate, supported upon cantilevers, the walls lined with white-glazed bricks or tiles, and the floor formed with some impervious material. Personally, he preferred a slate table in the centre of the room, leaving the walls free. Larders should not be formed underground.

Pantry and Stillroom.

The butler's and footmen's pantries and the stillroom required sinks, which might be either of enamelled fireclay or lead-lined. They were usually provided with draining-boards, preferably of beech, if not covered with lead. The space under the sinks was usually enclosed; when this was done the walls and wooden sides should be painted with white enamel and a lead safe formed on the floor, turned up all round at least 6ins., having a 1in. waste-pipe discharging through the wall into the open air. This cupboard was generally used for a pail to receive pieces, tea-leaves, &c., and soon became insanitary if precautions were not taken to ensure cleanliness. Enclosures under or around any sanitary fitting invariably became nuisances, and it was preferable, except in special instances, to omit them and everything that hindered the regular cleaning of the recesses. All these sinks should have drinking water laid on from the main supply pipe.

Soil Pipes.

These were usually of cast-iron or drawn lead—cast-iron made in 6ft. lengths, either coated with Dr. Angus Smith's solution or galvanized; the latter being most suitable when the pipes were to be painted to match the rainwater pipes, because paint would not remain upon Dr. Angus Smith's solution. These pipes were cheaper than lead, less liable to damage, and more easily fixed and jointed, but they were more unsightly, and there was difficulty in obtaining a branch to exactly suit the position, and many branches meant many joints and much cutting of pipe. A cast-iron junction usually meant at least three joints, while in lead pipe only one was necessary.

Drawn lead soil pipe was made of thicknesses corresponding with those of sheet lead. The pipe whose thickness was equal to that of 8 lb. sheet lead was the strength most generally used, or for special purposes 10 lb.

Rarely would it be necessary to exceed 3½ins. internal diameter for any soil pipe, especially in country houses. A ventilating pipe was quite a different matter: for this 4ins. to 6ins. diameter might be often more suitable than 3½ins.

If it were necessary to fix the soil pipe within a building, it should be of 8 lb. drawn lead at least, but should not be buried in the wall, and if in a chase, the walls should be treated as previously described for water pipes and the casing in short lengths secured with brass cups and screws to framed grounds fixed to the walls. The most suitable place to fix a soil pipe was outside the building, in which case it should be arranged in such a manner as to be as unobtrusive as possible. The method usually adopted of fixing soil pipes in 10ft. lengths with three pairs of double cast-lead tacks was certainly efficient, but at the same time it was not elegant. Sometimes astragal joints or socket joints were used instead of the usual wiped joint, with disastrous results, there being insufficient solder to form a lasting connection, more especially if it were fixed with sheet lead tacks fixed 6ft. apart. How could this be remedied? One way he had found very successful was to have strong pipe in, say, 6ft. lengths, to agree with the rainwater pipes, which might also be of lead and fixed to walls with extra strong lead strips wiped on to the pipe at the joint and covered with ordinary sheet lead ears, the joints being "wiped" in the usual way, with a small astragal attached to the pipe above and below the joint. By this means the pipe was securely jointed and fixed, and, except to the initiated, was similar in appearance to the rainwater pipes.

They were told that an "anti-syphonage pipe" was necessary to preserve the seal of the closet trap. Quite so, but in the majority of country houses anti-syphonage pipes were not necessary, there being only two principal floors as a rule. Perhaps in one or two instances it might be necessary, but it need not occur upon the principal elevations in a carefully-planned building.

Soil pipes now invariably discharged direct into the drain, and the upper part was continued above the roof of the same to greater diameter, with a simple open end protected by a stout copper-wire balloon. Cowls had been proved by experiment and practice to have few, if any, advantages over open ends, as these pipes frequently acted as inlets as well as outlets. The less obstruction there was to check the current of air the better.

Boiling water should be carefully excluded from lead soil pipes, otherwise the undue expansion would split or tear apart the lead at the junctions between the branches and the main pipe.

Waste Pipes

from baths, lavatories, sinks, &c., not being slop sinks, should always discharge into gulleys in the open air beneath the grating but above the water. This was very important, as many by-laws required them to discharge into a channel 2ft. from the gulley. A more objectional arrangement it was difficult to imagine. He hoped before long to see the provincial authorities follow the example of the L.C.C. and eliminate this undesirable by-law.

Waste pipes, if more than a few feet long, needed to be of some material which was not easily damaged by hot water. Wrought-iron with screwed joints or cast-iron with caulked joints were most generally in use, although the short lengths referred to previously and short branches might be—and in fact were — preferably of lead. The expansion of iron pipe, if connected directly to a lavatory basin, &c., was very likely to damage the fitting.

Wrought-iron pipes were expensive and more liable to rust than cast-iron, which was cheaper and stronger and allowed a little play at the joints. In course of time the joints would probably need recaulking if the stack was very long and had very hot water frequently passing through it.

Cast-iron pipe lined with lead had been referred to in one of the latest books as the best for all purposes. Mr. Smith, however, pointed out the difference in the expansion of the two metals, observing that while the lead would "creep" under the heat and could not bulge outwards because of the iron coating, it was forced inwards, with the result that the pipe was practically choked.

Waste pipes generally might be considered similar to soil pipes as regards fixing, &c., but they should discharge into a gulley near the foot (which in certain positions should have an air-tight cover and be ventilated at a convenient position away from windows, &c.). The upper part should be carried above eaves and windows, and the traps of each fitting should be protected by a puff-pipe, brought under the basin top to the face of wall outside; this puff-pipe, besides protecting the trap under the fitting, acting as an overflow in case the vertical pipe without heads was temporarily blocked.

The traps should be of strong Anti-D cast-lead type, with screw cap for cleaning and a short length of lead connected to the iron pipe with brass tailpiece and caulked joint outside.

Traps from lavatory basins should be of 1¼ins. diameter, while those from the bath and sinks, except scullery sink, should be 2ins. diameter, and the scullery sink 3½ins. to 2ins.—that was, 3½ins. at inlet, to receive a large cobweb grating.

Drains.

The choice between iron and stoneware drains was generally determined by the nature of the ground and surroundings and the relative positions of the house and drain. On a bad foundation, when passing under a building, or if the drains were near the surface, iron pipes, possessing greater strength and having fewer joints, were less liable to damage, but the inside was not so smooth, nor did it resist acids to the same extent as glazed stoneware. A well-laid stoneware drain, with clear bore bedded upon and protected by good cement-concrete with carefully-made cement joints, was much more self-cleansing than an iron drain. The cost of drainage was practically the same whichever kind of pipe was used, less concrete being required for the iron pipes.

Fall was an important factor in drains—1 in 30 (or 4ins. in 10ft.) was most suitable for a 4in. drain, and 1 in 40 (or 3ins. in 10ft.) best for a 6in. drain. Excess of fall was quite as unsatisfactory as too little.

Gulleys.

All gulleys should be bedded in cement-concrete, fixed as near the surface of the ground as possible, and covered with a 3½in. dished York stone to receive grating. When it was necessary to keep the gulley low down, a chamber 12ins. square (inside dimension) should be formed of 9ins. brickwork in cement, smoothly rendered and brought up to receive the dished cover stone at surface of ground. It was essential that these extensions, and in fact the whole system, should be watertight. Deep chambers over gulleys were not desirable.

Circular gulleys (and square ones, by the use of an adapter) were sometimes brought to the surface with 9ins. diameter stoneware pipes, in which case the pipes should be surrounded with concrete. It was advisable to have all ironwork, except iron drain pipes, &c., galvanized, to protect them from rust. It was sometimes held that the galvanizing soon perished; but Mr. Smith said he had not experienced any inconvenience in that respect.

A flush tank, when connected to the scullery gulley, was very useful for breaking up and driving the grease through long drains. Sometimes the bath waste was arranged to effect this object. The gulleys should be of the self-cleaning, deep-seal type, with 10in. grating. Those used for surface drainage only should be made deep, to retain the grit, &c. When a waste pipe discharged some little distance from a gulley it was often advisable to fix an access shoe at the foot and carry the drain to the inlet of gulley underground. This shoe should have a stone cover similar to those used for gulleys, and a galvanized iron plate let in instead of the grating, to keep out leaves, stones, &c.

So-called grease traps were ineffective, as well as very offensive and dangerous contrivances.

Chambers, or Manholes,

should be placed at intervals in the drainage system, at bends, junctions and at points of disconnection; also in straight runs of considerable length, at least over 60ft., to facilitate sweeping, &c. The chambers should be formed upon a 6in. bed of concrete, with 9in. brick walls, smoothly rendered inside to underside of cover, the bottoms formed of white-glazed channel with three-quarter channel branches, and brick-on-edge placed vertically along the main channel and benched up to an angle of 30 degs., to offer as little facility as possible for lodgment in the event of a temporary stoppage, and also to give a secure foothold, which a steeper angle did not give.

The portion not enclosed by the iron cover should have 3in. York stone firmly bedded in cement. The size of these chambers depended upon their depth. A shallow chamber—that was, up to 2ft. 6ins. deep—should be as nearly the size of the iron cover as was consistent with the number of branches it received, while deeper ones should be about 2ft. 6ins. wide and at least 3ft. long, to give a man room to work in them.

Mr. Smith said he had not advocated iron chambers even when iron drains were used, because he was of opinion that it would be a long time before we were able to find anything better than the chamber of rendered brickwork and white-glazed stoneware channels. Iron chambers were simply inspection bends or junctions; it was difficult to make the covers watertight, and they were difficult to open, especially when it was necessary to remove an obstruction. They were sometimes useful inside a building at the top end of a branch where the drain was shallow. These iron chambers still required the brick chamber, which should be rendered, and an iron cover for access, so that there was little or no advantage in using them.

Chamber Covers

were of various types, those with a condensation seal being undoubtedly the best, especially when inside a building.

Locking covers, except in certain exposed positions, were not necessary. Covers should have eyelets for hooks, instead of hand holes, and be strong and heavy. Locks and bolts only became corroded, rusty or broken, and were then useless. Hinged covers were always a trouble, and were going out of use.

Ventilation of the system should not be forgotten. Soil pipes usually provided the necessary outlets, but they were not sufficient alone in all cases. The idea that two or more pipes taken from different branches to above the roof would secure efficient ventilation was erroneous.

Rainwater Drains.

When the rainwater drain was treated separately from the soil drainage there should not be gulleys at the feet of rainwater pipes, but, instead, stoneware or iron access shoes with cover stone and plate, to prevent surface-water or other undesirable matter finding its way to the rainwater storage tanks. Otherwise the drains should be constructed similar to soil drains. They were usually of 6ins. diameter, with 4in. branches to a single down-pipe.

Rainwater Storage, &c.

Rainwater, especially when gathered in the country, was fairly clean, and if filtered and stored in suitable receptacles was a great acquisition, more particularly for washing purposes. It was best, whenever possible, to collect and store the rainwater as near the roof as practicable, thus saving expensive pumping machines and underground drains and tanks. Needless to say, a large overflow was essential to prevent flooding in time of heavy storms. When stored underground, the tank or reservoir should be similar to that previously described when considering water-supply and storage, with the addition of a filtering chamber.

Purifying Rainwater.

There were two means generally adopted for removing many of the impurities such as soot and roof washings from rainwater. The separator, which allowed the first portion of the water to run to waste and then by a rocking motion passed the remainder to the storage tanks, was effective, but, of course, there was waste of water, which in a dry season was a consideration; while a filter composed of broken bricks, ballast and sand was most useful, but needed occasional cleaning. Some favoured a small settling chamber divided from the filter by a brick wall built with half a dozen courses, dry at the bottom, giving upward filtration, thus avoiding to a great extent choking of the upper surface of the filter, as in the case of downward filtration. All the tanks needed an overflow, but this should not be connected to the soil drains.

Land Drains.

When the subsoil of the site was surcharged with water it was advisable to conduct it away from the building as much as possible. This was accomplished by means of agricultural drain pipes laid without joints a short distance apart in trenches, and covered with ballast or brushwood to within a foot or so of the surface, and topped with ordinary garden soil or mould.

Rainwater or subsoil-water should be excluded from soil drains if the sewage was to be treated either by chemical or bacterial processes, otherwise unnecessary expense would be incurred by the increased volume to be dealt with.

Stables.

The floors of stables should be of hard impervious material, with as few joints as possible, and currented to fall to a channel just outside the stall divisions, which discharged either through the wall into a gulley or into an open end in the channel and thence to a gulley outside. This open end was a small pit formed with a white-glazed channel bottom and cement sides; the pit was made large enough to receive a galvanized cast-iron perforated bucket to catch straw, &c., and was covered with a heavy hinged cast-iron grating. It was often desirable, however, to provide a shallow channel with a cast-iron cover, let in flush with the

ROMAN AQUEDUCT, ALGERIA.
This fine specimen of Roman work is about three miles south of the wonderful city of Constantine. It is more than 60ft. high, and the five arches are in an excellent state of preservation. The photograph was taken by Mr. Charles M. C. Armstrong, of Warwick.

paving, and with similar branches to the centre of most of the stalls, to prevent the straw becoming wet. Loose boxes usually had the open end before described in the centre continued to the gulley outside.

Every channel and drain in a stable needed to be easily accessible for cleansing and sweeping, and there should be no gulleys inside the buildings.

The manure pit should have hard impervious walls and floor, the latter currented to an outlet pipe discharging through the wall into a gulley. These gulleys should be self-cleansing, but required a galvanized perforated bucket to catch straw, &c.

Besides stalls and loose boxes for carriage horses, hunters and cart-horses, there was usually a sick box. This should be quite apart from the others and have a separate drain from it. The washing space should have a deep yard gulley to retain the grit from washings, &c.

If there was a shoeing forge a drain from where the horses stood should not be forgotten.

Drains from stables, cowyards, piggeries, &c., should always drain into a liquid manure tank carefully built in brickwork in cement and rendered watertight, having a rounded bottom to facilitate removal of sediment. There should be a pipe from ground level to about 1ft. 6ins. from the bottom, into which could be dropped the suction pipe of a pump attached to a manure cart. The liquid manure could then be carted to the fields or gardens where required. These underground storage tanks should also be provided with an access hole in their crown, and an overflow to carry off an excess which might accumulate in time of storm from surface-water gulleys, &c., and might be connected to the main drain from the house to the filter beds, &c.

An ample supply of water was important for the stables, but it should be distinct from the house supply. A cistern in the loft or clock-tower, to which the men could pump water, was a great convenience, and a hose could then be used for washing horses and carriages. One or two sinks were necessary in the harness-room or in a small room adjoining, with hot and cold water laid on to them. If a suitable grate with a boiler were fitted in the harness or mess room an ample supply of hot water could be provided for these sinks, which would be found very useful for various purposes.

Cowhouses.

Each division in a cowhouse accommodated two cows, and a wide trough was formed just outside the heel-post. This channel and the dunging passage should be formed of an impervious material with grooves to prevent the cows slipping, and in the centre of each division should be an open end similar to those in the stables, conducted to a gulley outside. The space where the cows stood should be level, and formed of well-rammed chalk or clay. Calving boxes were treated like loose boxes, with an open end in the centre discharging into a gulley outside. Calf-pens usually had an open channel discharging over a gulley. Pigsties should discharge through a pipe into a wide channel outside the sties, and be conducted to a gulley with basket before entering the drain.

Dairies

should be in a cool sheltered position within easy distance of the cowsheds and well-ventilated. Near at hand should be the dairy scullery, with sink, hot and cold water laid on, and paved floor currented to a pipe through the wall discharging on to a gulley, not inside the building, as was frequently the case.

Disposal of Sewage.

The sewage when it arrived from the house and buildings might be treated in various ways, but time would not permit of a description of them all. One very simple and effective method which had proved quite satisfactory in dealing with this class of sewage might, however, be briefly described. The sewage from a large country house with stabling for forty horses and accommodation for twenty cows, after leaving the disconnecting chamber, was first retained in a large watertight settling tank, covered over similarly to the old-fashioned cesspool, except that the inlet and overflow were turned down, thereby, among other reasons, preventing the scum finding its way into the drains. The tank was capable of holding at least one day's flow of sewage. The overflow was discharged upon the surface of a long open-air filter situated in a meadow, and composed of broken bricks, clinker, &c., finished with smaller local material on top. The sewage was distributed over the surface of the open-air filter by channels or a sprayer and allowed to percolate through 4ft. to 5ft. of material, when it reached a layer of land drain pipes at the bottom which conducted the effluent to the end of the filter and thence to the land or ditch. The effluent was colourless and odourless. The water in the ditch which received it was foul and a nuisance before the introduction of this form of filter; after the filter had been in use about three years it was quite sweet and wholesome.

A discussion followed.

IN PARLIAMENT.

(By our Press Gallery Representative.)

ON February 22nd Mr. Wylie, the member for Dumbartonshire, who takes a considerable interest in the amenities of the House of Commons, asked Lord Balcarres, representing the First Commissioner of Works, what had been done during the recess for improving the ventilation and sanitary arrangements of the buildings, and what, if anything, remained to be done to fulfil the recommendations of the committee's report on the subject.

Lord Balcarres stated that during the recess the recommendations of the Select Committee of the House of Commons with reference to the ventilation had been carried into effect, with the exception of the completion of the extract fan. This had been delayed by reason of structural difficulties incidental to the floor of the Commons lobby chamber, but it was expected that this fan would be running within a month from date. The principal improvements already effected were (1) the complete washing of the air by means of a new type of water screen, (2) the erection of a much more powerful intake fan, (3) the more effective isolation of passages joining the main airways. This would be followed by experimental tests having in view the better distribution of air to the Chamber, and also by tests of the air so distributed. It was hoped that the works already completed would result in a very considerable improvement in the quantity and quality of the air-supply.

Replying to Mr. Whitmore on February 17th, Mr. Arnold-Forster, the Secretary for War, stated that the question of the disposal of the site of the Government's military school at Chelsea could not be definitely decided until the provision of accommodation for the school elsewhere was further advanced.

Lord Balcarres has promised to satisfy the curiosity of hon. members by having placed in the tea-room of the House of Commons plans showing how the opening of the Mall into Charing Cross will be carried out, along with drawings of any architectural features that are to form part of the general design.

Lord Balcarres informed the House that a path 65ft. wide was being made from the Victoria Memorial to Piccadilly. It would have a grass border of 15ft. and would be planted on either side with a double avenue of trees. It was not intended to make a road now or in the future.

A petition praying to be heard in committee against the London Building Acts Amendment Bill has been presented by the District Surveyors' Association (Incorporated), London.

Mr. Henry Hobhouse asked the President of the Local Government Board if he would lay before the House a return of the building by-laws made by rural district councils which affect the construction of cottages, and if he proposed to have any enquiry into the subject.

Mr. Long replied that he was afraid that looking to the differences in detail between various series of by-laws it would scarcely be practicable to indicate each area by means of a return. He was receiving representations from various quarters, and the whole question was engaging his attention. He had not at present arrived at a decision with regard to the course to be adopted in the matter.

Keystones.

Mr. H. H. Richardson, of 2, Broad Street Buildings, E.C., has been appointed solicitor to the Society of Architects. He is an honorary member.

Another new Leeds Church.—In Holbeck, Leeds, the new Church of St. Edward is being completed, Mr. G. F. Bodley, R.A., being the architect. The cost will be £30,000.

New Midland Station, Sheffield. — The greater portion of the new frontage to the Midland passenger station, Sheffield, will be completed shortly.

The Tallest Residential Dwellings in London are Queen Anne's Mansions, situated near St. James's Park. These were erected in 1876 and comprise fifteen storeys, reaching to a height of 180ft.

The Gaiety Theatre Design.—Mr. A. T. Franklin, as arbitrator between the London County Council and the Gaiety Theatre Co., has fixed £17,217 as the increase of cost to be paid by the Council for the added embellishment of the new Gaiety Theatre. The company claimed £28,000.

L'Architecte Français.—On the occasion of the first visit he paid to London, M. Redon, the French architect, remarked: "London is wonderful. C'est grand, c'est beau, c'est digne—comme un policeman! I was never so struck by London as when I got back to Paris, the streets of which looked très coquet, mais articles de Paris."

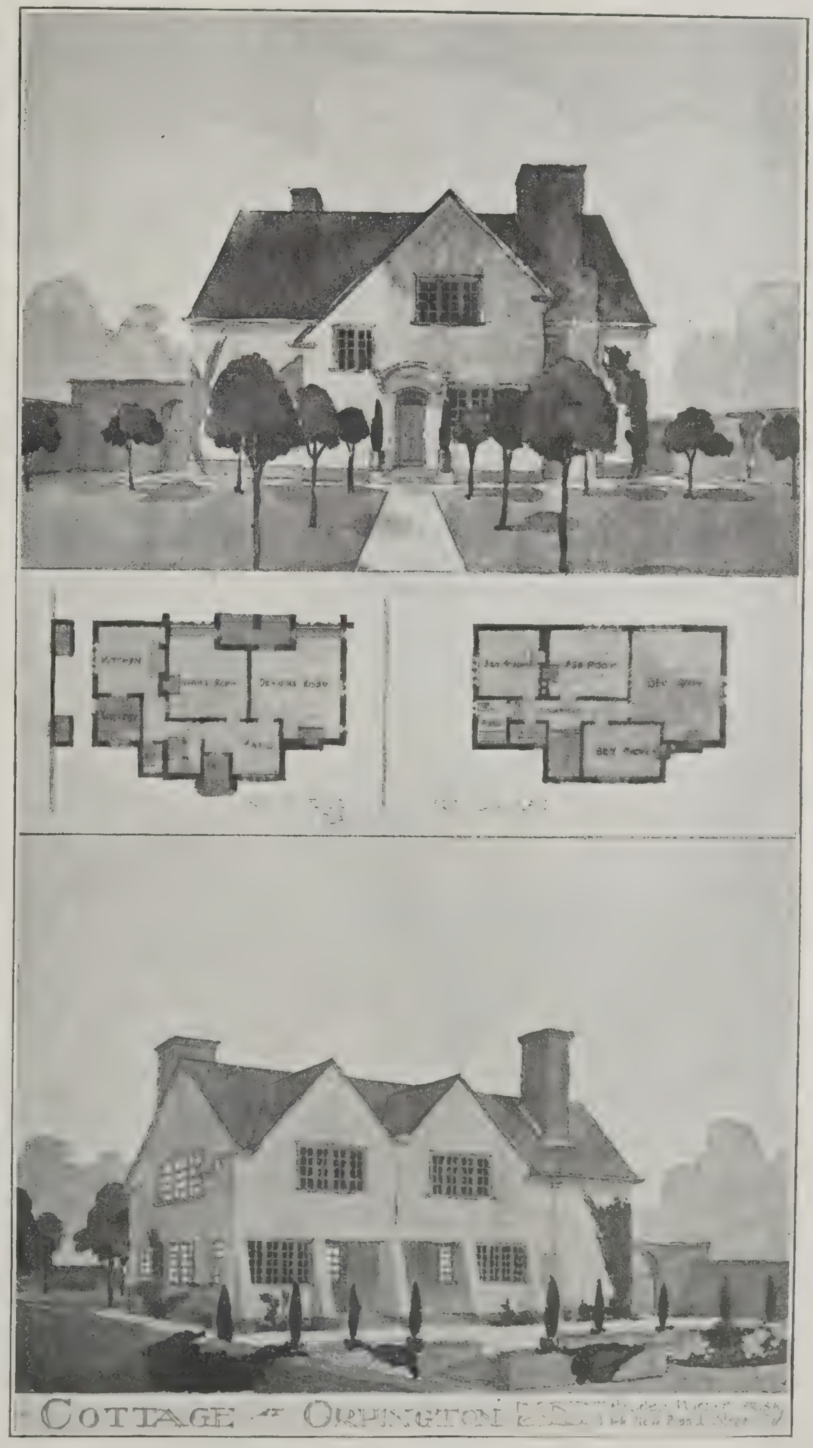
Northern Architectural Association.—At the recent (fourteenth) annual social gathering in connection with the students' sketching club, Mr. A. B. Plummer (secretary of the Association), on behalf of Mr. W. Glover, past-president, asked the Association to accept a presidential chair of oak and green leather, with the arms of the Association carved upon it. Mr. Plummer spoke warmly of the generosity of Mr. Glover, whom they had to thank for the travelling studentship, for the presidential badge, and for the new premises they were about to occupy. During the evening the president, Mr. J. Walton Taylor, F.R.I.B.A., distributed the prizes, the Glover medal and travelling studentship being awarded to Mr. G. S. Twizell.

The Future of Birmingham was the subject of a paper which Mr. William Henman, F.R.I.B.A., read before the last meeting of the Birmingham Architectural Association. After giving his impressions of Birmingham on his first visit thirty-three years ago—for Mr. Henman was born in London — he observed that there was still ample room for improvement. There had been too much self-gratification displayed since Birmingham was called the best-governed city in the world. Mr. Henman asked his hearers whether, from an architectural standpoint, Birmingham had kept reasonable pace with its prosperity. The new Corporation Street might be made an ornament to the city or the very opposite. He regretted that the street was begun under the Workmen's Dwellings Act rather than as a street improvement. The line adopted for it was by no means the best available. Many of the streets crossed at awkward angles, and the older streets were damaged as business thoroughfares. They should be thankful for its construction, however, in that it had provided an airy thoroughfare and had given character to the city. Mr. Henman, by the aid of maps, illustrated the inconvenience caused by the lack of through streets. He suggested improvements between Paradise Street and Five Ways; and on land between the Prince of Wales Theatre and Easy Row, in the neighbourhood of the Crescent, he saw a site for the new cathedral, clergy house and other public buildings. Ready communication could be obtained between the centre of the city and Bordesley by a continuation of New Street.

New Council Offices at Cleethorpes have been erected from designs by Mr. H. C. Scaping, architect, of Grimsby, and Mr. E. Rushton, town surveyor. Mr. H. Marrows, of Grimsby, was the contractor. Fireproofing flooring has been laid by Messrs. Mark Fawcett & Co., of London, and wood-block floors have been laid by Messrs. Hollis Brothers, of Leicester.

Competition for Carnegie Library at Townhill, Dunfermline.—The Carnegie Dunfermline Trust have accepted the designs of Mr. Peter L. Henderson, Edinburgh, and have awarded the premiums of £25, £15 and £10 to the three designs considered next in order of merit, namely, those of Messrs. James T. Scobie, Dunfermline; Henry F. Kerr, Edinburgh, and Kerr & M'Culloch, Alloa. More than sixty designs were received, six of which were submitted to Messrs. Morham & Gardiner, of Edinburgh, who estimated the cost of each. The building is to cost £3,500 and will provide a library for 4,500 volumes, as well as reading, recreation, billiard and smoking-rooms.

Edinburgh Architectural Association. – At the recent annual dinner of this Association Mr. Crabb Watt, K.C., glanced at what had been done during the past thirty years to preserve the charm of the ridge from Holyrood to the Castle, and to promote throughout the city symmetry of outline, ornamentation of elevation, and the breaking-up of skylines. The principal blot was probably the horizontal roof of the Caledonian Station, while the design of the North British Railway buildings would perhaps have been better if it had been Gothic, with a tower like the Marischal tower in Aberdeen. If the Association exercised more authority and was able to assert its views more forcibly they might possibly prevent the demolition of a not untasteful structure in the Synod Hall and the waste of money which could go to the beautifying of a hall on a vacant site. He instanced the National Portrait Gallery in



P. MORLEY HORDER, F.R.I.B.A., ARCHITECT.

This cottage is built with hollow brick and rough-cast walls, red brick chimneys and red-tiled roof. The contract for the whole was £515. The internal fittings are simple but the best of their kind.

Queen Street as one of the best types of architecture that had been seen in this country for the last twenty years; while "The Scotsman" buildings in mass, symmetry and decoration were unequalled in the Kingdom. During the evening Mr. Hunter Crawford, on behalf of the members, presented Mr. William M. Page (who is removing to Glasgow) with several volumes of standard works on architecture, in recognition of his services as secretary of the Association for the past four years.

The New Exe Bridge is nearing completion.

King's College Hospital.—The selection of the design for the rebuilding of this hospital on a site at Camberwell will probably be made in April or May. Six architects are competing.

Mr. H. Stuart Jones, director of the British School at Rome, will be leaving for England on March 6th, and is then giving up his position. The name of his successor has not yet been made public.

Competition for a Clock Tower.—Architects within twelve miles of the site of the obelisk in St. George's Circus, S.E., are invited to submit designs for the clock tower which is to take the place of that monument. Messrs. Thompson & Pomeroy, 49, Hill Road, Wimbledon, have been appointed advising architects and assessors. Designs are to be delivered to them on or before March 31st. Premiums of £20, £15 and £10 are offered.

The Phœnix Fire Office, Leeds, now being erected from designs by Mr. W. H. Thorp, was visited last Saturday by the students attending the classes in building construction at the Leeds Institute. These classes are held on Monday, Wednesday and Friday evenings throughout the session (from September to May), and number 176 students. Last session the examination successes were over 84 per cent., which is excellent. Mr. James Neill is the instructor.

Leeds and Yorkshire Architectural Society.—Mr. Maurice B. Adams, F.R.I.B.A., read a paper on public libraries before this Society last Thursday. After dealing briefly with the history of the subject—mentioning the famous "Record Office" at Kouyunjik founded more than twenty-five centuries ago, the library of the great temple at Nippur (discovered four years ago by Dr. Peters, of New York) carrying back Babylonian civilization to 7,000 B.C., and the great library of Pergamon, founded 200 B.C., with 200,000 volumes—Mr. Adams spoke of modern conditions and the stern realities of the "penny rate," which was fixed more than fifty years ago, though any town could now, by special Act of Parliament, augment its penny rate for library purposes, and twenty-eight boroughs, with satisfactory results, had done so. Mr. Adams said he thought that the Board of Education should have powers to include library enterprise when making grants for educational purposes. The system of State aid for libraries obtained in Canada, Australia, South Africa and the United States. The central library at Boston, U.S.A., cost £473,000, and contained 800,000 books, with ten branch libraries besides, averaging 20,000 volumes each: the yearly cost of maintenance was £52,000, out of which the city purse provided £47,000. Mr. Adams proceeded to deal with the planning of a public library, observing that according to the usually accepted *regime* in proportioning the floor area, with a closed lending department, the following allocation of space for every 10,000ft. super. had been recommended, 3,000 sq. ft. for newspapers, 2,000 sq. ft. for magazines, 2,000 sq. ft. for the reference department, leaving 3,000 sq. ft. for the lending library.

A Prize of £20 for a Lectern in Hardwood is offered by the Carpenters' and Joiners' Companies, who will hold an exhibition of works in wood next June.

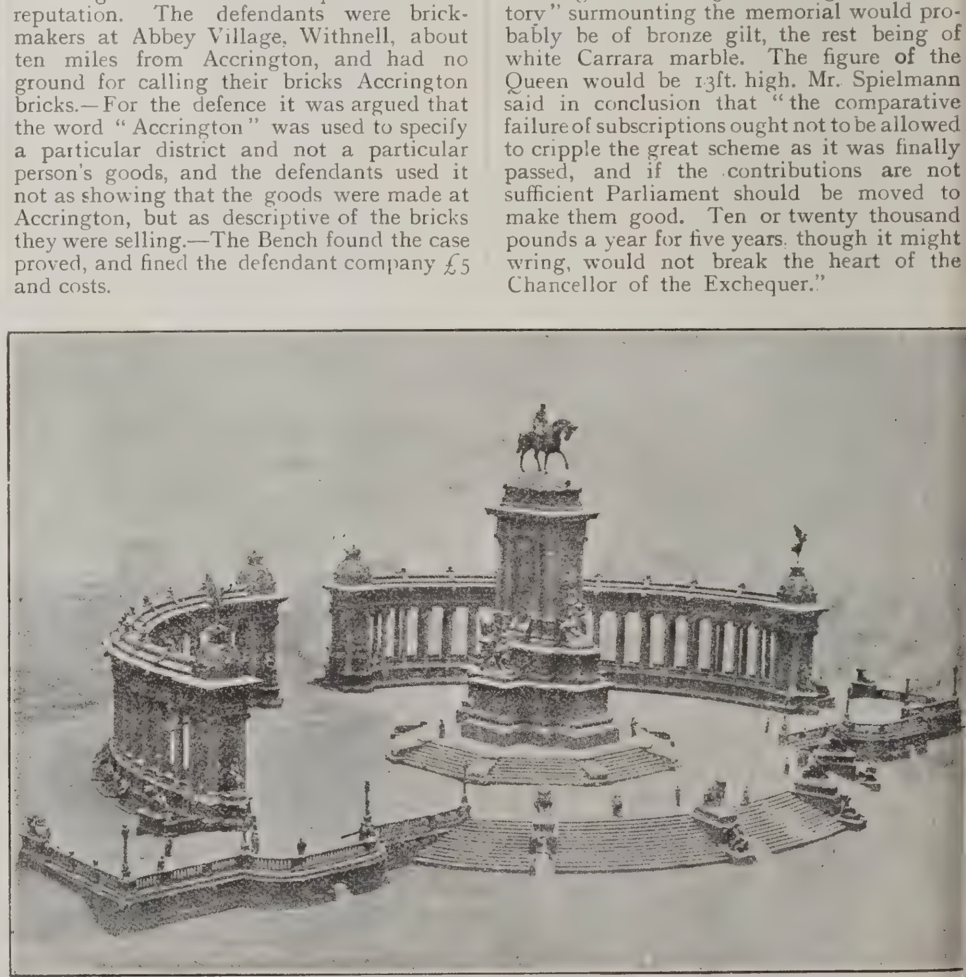
Sheffield Society of Architects and Surveyors.—At last Thursday's meeting of this Society a paper on "The Curvilinear Period of Gothic Architecture" was read by Mr. Mitchell-Withers. The terms under which this period was known by different writers were briefly enumerated, such as "late Decorated" and "the flowing period," but Mr. Mitchell-Withers considered that Sharp's term of "the curvilinear period," dating from 1315 to 1360, was the most satisfactory. The lecturer then proceeded to deal with his subject in detail.

Law Cases.

Accrington Facing Bricks. — At the Chorley Police Court last week Mr. Jonathan Booth, sales manager of the Accrington Brick and Tile Co., Ltd., summoned the Withnell Brick and Terra-cotta Co., Ltd., under section 2 of the Merchandise Marks Act, 1877, for unlawfully applying the words "Accrington facing bricks" to certain bricks made by them. The plaintiff company, said counsel, was established at Accrington fifteen years ago, and there were upon the same field, or within a radius of a mile, three other brick companies, who also manufactured what were known as Accrington bricks. The other companies were the Enfield Brick and Terra-cotta, Whinney Hill Plastic, and Huncoat Plastic Brick and Terra-cotta. The four companies were all within the postal, telegraphic and telephonic area of Accrington, and the plaintiff companies had during the period mentioned spent enormous sums in advertising bricks manufactured on the Accrington brickfield, and "Accrington bricks" had acquired a wide reputation. The defendants were brickmakers at Abbey Village, Withnell, about ten miles from Accrington, and had no ground for calling their bricks Accrington bricks.—For the defence it was argued that the word "Accrington" was used to specify a particular district and not a particular person's goods, and the defendants used it not as showing that the goods were made at Accrington, but as descriptive of the bricks they were selling.—The Bench found the case proved, and fined the defendant company £5 and costs.

NATIONAL MEMORIALS.

At last week's meeting of the Society of Arts Mr. M. H. Spielmann read a paper on the "Queen Victoria Memorial, as compared with other Memorials Abroad," in the course of which he showed views of the memorials of Peter the Great, Alexander I., Alexander II., Nicholas I. and Catherine II. in St. Petersburg; the Empress Maria Theresa in Vienna; Gambetta in Paris; Carnot in Lyons; Alfonso XII. in Madrid (illustrated below, through the courtesy of the Royal Institute of British Architects); several of the modern monuments in Berlin; the Victor Emmanuel memorial in Rome; the great memorial building to be erected on the Maidan in Calcutta (illustrated in our issue for last week), and others. These views formed a suggestive introduction to a detailed description of the National Memorial to Queen Victoria now in progress in front of Buckingham Palace. The model of the principal monument was now being enlarged to one-half full size. But it had unhappily been quite recently decided that the funds available did not permit of the larger scheme proposed for the whole memorial being carried out. The sculptures in the processional road were to be suppressed, and as the Colonies contributed considerable sums, the gates with the armorial decorations of arms and emblems of these Colonies, and the sculptures facing them on the side fountains, would be set up in their names. The Mall side was allotted to Australia, that on the north to Canada, the entrance from the processional way to South Africa, while of the great fountains in the quadrants that to the south-east would be in the name of West Africa and the Indian Dependencies, that to the north-east representing Newfoundland and the West Indies. The width of the chief roadway leading up to the Memorial from Charing Cross was 65ft. The figure of "Victory" surmounting the memorial would probably be of bronze gilt, the rest being of white Carrara marble. The figure of the Queen would be 13ft. high. Mr. Spielmann said in conclusion that "the comparative failure of subscriptions ought not to be allowed to cripple the great scheme as it was finally passed, and if the contributions are not sufficient Parliament should be moved to make them good. Ten or twenty thousand pounds a year for five years. though it might wring, would not break the heart of the Chancellor of the Exchequer."



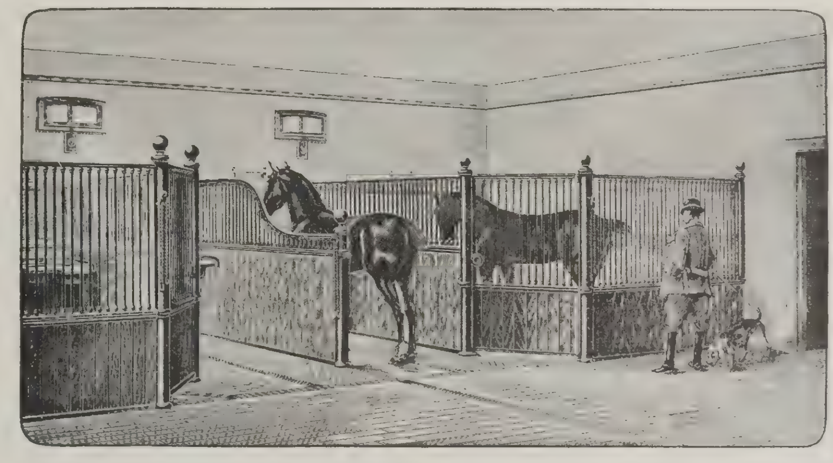
MODEL OF MEMORIAL TO ALFONSO XII., LATE KING OF SPAIN, IN COURSE OF ERECTION IN THE PARK OF MADRID. JOSE GRASES RIERA, ARCHITECT.

CARRON

STABLE FITTINGS

UNSURPASSED FOR EFFICIENCY AND GENERAL EXCELLENCE

Largely adopted by the nobility and gentry throughout the country, amongst whom the following may be mentioned: DUKE OF BUCCLEUCH, MARQUIS OF LONDONDERRY, EARL OF YARBOROUGH, EARL OF DERBY, EARL OF SEFTON, LORD HOWARD, RIGHT HON. J. B. BALFOUR, SIR DONALD CURRIE, SIR SYDNEY WATERLOW, MAJOR CARDEW, CAPTAIN BISSETT, &c., &c.



Stable Interior, showing Two Stalls and Two Loose Boxes with deep panelling, which enables a good view of horse to be had from outside of Box.

Five Stalls and Loose Box, full size, on view at our London (City) Showrooms, 15 Upper Thames Street, E.C.

Plans and Estimates sent on request to Dept. 24.
Write for No. 24 Stable Fittings Catalogue.

Carron Company
INCORPORATED BY ROYAL CHARTER 1773

Works: CARRON, Stirlingshire, N.B.

Carron Company also Manufacture Cow House and Piggery Fittings of every Description.

AGENCIES, SHOWROOMS AND DEPÔTS:—

LONDON (City)—15 Upper Thames St., E.C.; LONDON (West End)—23 Princes St., Cavendish Sq., W.; LIVERPOOL—30 Red Cross St.; MANCHESTER—24 Brazennose St. & Hereford St., Ordsall Lane, Salford; BRISTOL—10 Victoria St. & 12 Welshback; NEWCASTLE-ON-TYNE—13 Prudhoe St.; GLASGOW—125 Buchanan St.; BIRMINGHAM—Guildhall Buildings, Stephenson St., & 76 Pershore St.; DUBLIN—44 Grafton St.; SOUTHAMPTON—Town Quay (The French Prison).

Electrical Notes.

Current for Power Purposes.—The Huddersfield Corporation has resolved to push the sale of energy for power purposes, and to give commission on the cost of motors to any contractor who shall arrange for the fixing of them, and has decided to distribute a sum equal to the commission upon all motors fixed *pro rata* to the number arranged by each contractor, the applications for which motors have not been handed in by any contractor.

Architects and Electric Light.—Commenting on Mr. B. R. Tucker's paper on electric and gas lighting, read before the last meeting of the Society of Architects (as reported in our issue for last week), the "Electrical Review" observes that apparently the author had nothing particularly new to state, "but it is a hopeful sign that this subject is being taken up by architects generally instead of leaving the question of lighting to the builder or contractor. Of course certain architects have made a speciality of the lighting of interiors, and we need only look at some of the latest West End theatres to see how successfully electric light has been used in order to secure the threefold advantages of good lighting, purity of atmosphere and pleasing artistic effects. We believe that many architects in matters of this sort consult electrical manufacturing firms in the drawing up of their designs and specifications; this is a practice that will always give the best results, as, although an architect has to know a great deal about some things, we cannot expect him to be conversant efficiently with everything. It is to the house-lighting question that the architect should devote more attention; and if he studies the subject and his clients at all we cannot see how he can fail to provide for the electric light."

The New York Central Railway is to be electrified at a cost of £10,000,000. The radius extends to 40 miles from New York. The electrified trains will cover all points of the road and its branches for the distance mentioned, but beyond that point the present steam locomotives are to remain in use. The new trains will be drawn by small engines weighing 85 tons each, capable of running at a regular speed of 75 miles per hour and of developing into a rate of 90 miles—a vast improvement on steam locomotion. Each engine will generate 3,000 h.p. Generating stations are to be erected 20 miles apart all along the track embraced in the electric zone, and the current will be transmitted to the engines by means of a third rail, which is to run alongside the lines over which the trains are drawn. Every precaution has been taken to safeguard human and animal life when crossing the track, it having been considerately arranged that there shall be no wagon roads or crossings on a level with the track, for where a road is met with, the track will be either lowered or raised so to pass under or over it. Trains will be run every two minutes, and the fares charged will be on a popular basis, so as to be very little higher than those charged on street cars. It is anticipated that the new system will be in full operation within the next two or three years.

New Companies.

Lower Halviggan Clay Co., Ltd., Victoria Place, St. Austell, Cornwall. Capital: £10,000.

Crateric, Ltd., to acquire the business of the Crater Cement Co. and the process for the production of cements known as Crateric and Vulcanum, 34, Old Broad Street, E.C. Capital: £5,000.

T. and M. Plowman, Ltd., manufacturers of and dealers in bricks, tiles, pipes, &c., Edmonton and Fletton. Capital: £40,000.

Matolin, Ltd., oil, colour and varnish manufacturers and merchants, builders, &c. Capital: £5,000.

James Darby, Ltd., lead and glass merchants, &c., Mill Street, Hull. Capital: £15,000.

Bankruptcies.

[Abbreviations: R.O.—receiving order; P.E.—public examination; C.C.—county court; O.R.—official receiver; Adj.—Adjudication.]

During the week ending February 24th twenty-eight failures in the building and timber trades in England and Wales were gazetted.

J. Ashton, housebreaker, Hackney. Adj. Feb. 17th.

Stevens & Co., builders, Southall. Adj. Feb. 16th.

C. A. Williams, builder and contractor, Bishopston, Bristol. Gross liabilities £1,427; deficiency £148.

H. Lee, painter and decorator, Leeds. R.O. Feb. 14th. P.E., Leeds C.C., March 14th, at 11.

Hards & Bradly, auctioneers and surveyors, London and Birchington-on-Sea. Adj. Feb. 17th.

Canwarden & Puddey, builders, Chiswick. R.O. Feb. 17th.

J. & J. Murphy, builders, East Ham and Catford R.O. Feb. 15th.

Benham & Baker, builders and decorators, Richmond, Surrey. R.O. Feb. 14th.

C. Pountney, retired builder, Bewdley. R.O. Feb. 13th.

J. Fuller, builder, Headley. P.E., Guildford Town Hall, March 14th, at 1.

J. T. Stevens, builder, Eastbourne. Liabilities £1,777; estimated assets £3,729; surplus £1,952.

H. Brookes, painter and plumber, Birkenhead. R.O. Feb. 17th.

E. Turner, joiner, Wakefield. R.O. Feb. 15th. First meeting, O.R.'s, Wakefield, March 2nd, at 10.30. P.E., Wakefield C.C., same day, at 11.

J. W. Bygate, builder and contractor, Rotherham. First meeting, O.R.'s, Sheffield, March 1st, at 12.30. P.E., Sheffield C.C., March 16th, at 2.

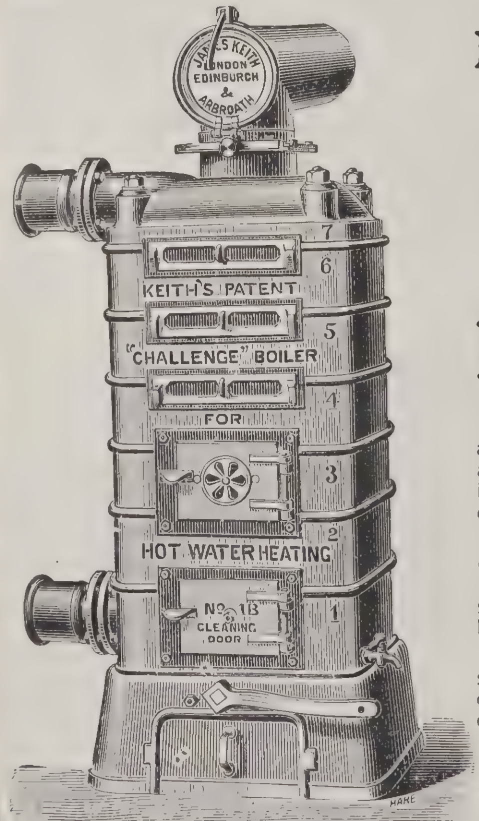
A. J. Corfield, slate merchant, Sheffield. First meeting, O.R.'s, Sheffield, March 1st, at 12. P.E., Sheffield C.C., March 16th, at 2. Gross liabilities £1,791; assets nil.

W. J. F. Andrews, builder, Tottenham. First meeting, O.R.'s, 14, Bedford Row, W.C., March 2nd, at 3. P.E., Edmonton C.C., March 20th, at 11.30.

R. J. Black, marble and stone merchant, Kensington, Acton and Strand. R.O. Feb. 13th. P.E., London Bankruptcy Court, March 29th, at 11.30.

W. H. Chedzoy, builder and plumber, Bristol. R.O. Feb. 17th. First meeting, O.R.'s, Bristol, March 1st, at 12. P.E., Bristol Guildhall, March 10th, at 12.

W. Vizzard, timber merchant, Broadway. R.O. Feb. 14th. First meeting, 45, Copenhagen Street, Worcester, March 1st, at 11. P.E., Worcester Guildhall, March 7th, at 2.



KEITH'S Patent
CHALLENGE
BOILERS
FOR HOT WATER
HEATING

Utilise the fuel to the greatest advantage even while working with a rested fire, all the heating surface being against the fire or immediately over it.

All parts readily accessible for cleaning or examination. Rapid internal circulation. Supplied in sections easy for transport or handling.

In sizes to heat from 500 to 7,000 square feet of surface; also other classes of the "Keith" Boilers capable of heating from 50 feet of 4-in. pipe to 24,000 feet.

Prices, &c. on Application.

SOME "SIMPLEX" FITTINGS.

Fixing block.

Corridor bracket with cast-iron shade.

Insulating facings for wood blocks and iron boxes.

Trade and Craft.

Simplex Conduit and Fittings.

Though this is pre-eminently the day of the specialist, so that the architect is more than ever disposed to leave the working-out of the details for the lighting, heating, drainage—even the decoration—of his buildings to those trade firms who devote themselves exclusively to such work, it becomes correspondingly requisite for him to be familiar with the proper way in which the work should be carried out, in order that he may not be imposed upon by unprincipled contractors. Take electric lighting as an example. He cannot be expected to know the minutiæ of such work, but he should be sufficiently well informed to distinguish between good and bad methods of wiring, to know the relative merits of lamps, their cost and maintenance, and other matters which concern the ultimate success of the installation. It is in this connection that we draw attention to the excellent handbook issued by the Simplex Steel Conduit Co., Ltd, of Westinghouse Building, Norfolk Street, Strand, whose price list for 1905 is also to hand. The conduit system is so well known now that there is no need to expound its advantages. Of course its especial merit is the neatness and facility with which a system can be laid out, and the ease with which any part can be got at; moreover, Simplex steel conduits are so carefully made that there is absolutely no chance of short-circuiting by reason of the wires being abraided by roughness or burrs inside. The parts for attachment to the tubing are so many and various that we cannot attempt to enumerate them here; we must refer the reader to the Simplex handbook for details of each; but a good idea of their neat design can be gained from the four illustrations above, showing a tumbler point, a fixing block, a corridor bracket, and the Simplex clips for attaching lights to girders. In the price list we note there are several important percentage reductions, the light- and heavy-gauge conduits being reduced by 12·4 per cent., couplings, bends, **T**-pieces and reducers by 17·8 per cent., junction boxes by 11·5 per cent., and brackets, pendant fittings, wiring accessories, running joints, &c., by 17·5 per cent.; thus bringing the system more than ever within the scope of the most inexpensive installations.

Builders' Notes.

Battersea Town Hall Estate. — The houses which have been built on this estate by the Battersea Borough Council (by direct employment) will be opened on Saturday, March 11th, at 3 p.m.

London Building Acts Amendment Bill.—The Lord Mayor has fixed Friday, March 3rd, for the holding of a meeting at the Guildhall at which, so far as the citizens are concerned, this Bill will be finally condemned.

Messrs. Main & Co., Ltd., of Glasgow, have secured the contract for the steel buildings to form the new workshops for the Britannia Royal Naval College at Dartmouth. The firm's works are to run day and night to complete the order.

The Patent Victoria Stone Co. has declared a dividend of 10 per cent. for the past year, with an additional dividend by way of bonus of 1½ per cent., less income-tax, on the second half-year's dividend. The nett profit for the year, after making provision for depreciation of plant, &c., was £13,841.

Mr. J. Howard Colls has been presented by the London Master-Builders' Association with a portrait of himself, painted by Mr. Orchardson, in recognition of the services rendered by him to the profession in carrying the case of *Home and Colonial Stores* v. *Colls* to the House of Lords.

Nottingham Master-Builders' Association.—At the annual dinner held last week Mr. E. Hind, alluding to the cry for cheaper houses, asked "How can we build cheap dwellings when we have so much Corporation red tape tied round our necks?" If only they could get in the council-chamber a few more gentlemen representing the building interests, they would not have all that red-tapeism and officialism brought before them in all their dealings.

Llandudno and District Building Trades Employers' Association.—Speaking at the annual dinner of this Association on Thursday last, Mr. H. Lever, of Liverpool, chairman of the Lancashire, Cheshire and North Wales Builders' Federation, said the Federation had done good by endeavouring to obtain a fair form of contract and a fair arbitration clause, and they were endeavouring to put an end to the practice of asking builders to send in priced quantities with tenders.

Sir William Grantham's Plans. — The "Local Government Chronicle" for February 25th gives, for the first time, fac-simile reproductions of the cottage plans deposited by Sir William Grantham with the Chailey Rural District Council, which were the subject of the recent prosecution. A full statement of the facts bearing on the proceedings is also published, so as to enable anyone to form a judgment as to how far the Council were justified in the action they took.

Worcester and District Master-Builders' Association.—At the annual dinner held last week Mr. Sharman Wood, in proposing "Success to the Midland Federation of Master-Builders," said that the Midland Centre had done very good work in the past, and had settled many disputes. Col. Barnsley and himself had to meet the representatives of the National Union of Plasterers in order to try to settle a difficulty, and he hoped they would succeed. At their last meeting a general hope was expressed that 1904 would be a more prosperous year, but prosperity had not arrived, and he feared the outlook was not encouraging. Col. Barnsley, in reply, said there were about thirty associations connected with the Midland Centre, having a membership of about 750. The trade was more depressed now than he had ever known it. Referring to the goodwill of the building trade, he said that in 1871 there were 580,000 men engaged in that trade, and to-day the number had nearly doubled. If they took the low average of £1 per week, they had the sum of 48 millions spent in wages yearly, and the usual percentage for material amounted to 73 millions, so that over 120 millions were spent yearly. That did not sound like a decaying industry, and he sincerely hoped they had now reached the darkest day before the dawn of a bright period of prosperity.

Correspondence.

Cottages with Baths.

To the Editor of The Builders' Journal.

Sir,—Referring to the plan on p. 102 of your issue for last week, for heating a bath by the copper, which Mr. Death, of Ipswich, proposes to register, I may mention that twenty years ago I fitted the same arrangement in a cottage where I lived. In my case the house was already built with a copper in the scullery, and to save space and building the bath was fitted under the kitchen floor across the fireplace. A hole was cut under the hearth-rug, one joist being taken out and the ends trimmed. The trimmers and joists at the sides made a rebate into which the boards (battened together to form a lid) fitted. The lid was hinged and opened away from the fire, making a comfortable bath in cold weather, and when the lid was down the room was as before. The waste from the bath was led into the side of the yard sink outside, just above the water-seal, and had a cock fitted in it which had to be shut to get the lid down. Hot and cold water were sent in *viâ* the copper. A drawing and description of this arrangement were published in the "Pall Mall Gazette" soon after it was fitted.

While Mr. Death's scheme provides a separate apartment for the bath, it has the drawback of the sink and copper being in the kitchen. Considering that this apartment is generally the living-room, these details are better outside in a scullery, in the opinion of—Yours truly, J. H.

Mr. James A. King, retired builder, of Aberdeen, died recently, aged 76.

Mr W. H. Curtin, sanitary inspector for Lincoln, died recently, aged 45, from typhoid fever.

Complete List of Contracts Open.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDERS MAY BE OBTAINED.

Privileges open to all Regular Readers of the "Builders' Journal."

I.—Free Monthly Advertisements.

1. A Free Advertisement of 12 words in the Wanted or Miscellaneous Advertisement Columns, in one issue of the BUILDERS' JOURNAL during each calendar month will be given to any regular reader.

2. The charge of one penny will be made for each additional word.

3. Advertiser's Name and Address or Box Number must be counted, but will in no case be reckoned as more than five words.

4. All advertisements must be accompanied by the correct remittance, and should a receipt be required a stamped addressed envelope must be enclosed.

5. The Proprietors reserve to themselves the right of refusing any advertisement.

II.—Free Answers to Enquiries.

1. The services of a large staff of experts are at the disposal of all regular readers who require information on architectural, constructional or legal matters.

2. Questions should in all cases be addressed to the Editor, and be written on one side of the paper only.

3. Correspondents are particularly requested to be as brief as possible.

4. The querist's name and address must always be given, not necessarily for publication.

Note.—Owing to the large number of enquiries we receive weekly, we are compelled to restrict the advantages of this department to Regular Readers.

III.—Free Accident Insurance of £500.

1. Every regular reader of the BUILDERS' JOURNAL is entitled to the benefit of this Insurance.

2. A Pamphlet giving full details of this and other Insurance schemes inaugurated by the BUILDERS' JOURNAL for the benefit of its readers, and guaranteed by "The Ocean Accident Corporation, Limited," will be sent on application.

What is a Regular Reader?

We have employed the term "Regular Reader" throughout these announcements as the description "subscriber" is often understood to mean one who subscribes direct to the publishing office.

We mean by a Regular Reader anyone who has placed an order with us or any newsagent or bookstall for the BUILDERS' JOURNAL for one year.

Those readers who order the BUILDERS' JOURNAL through their local newsagent or bookstall should send us the newsagent's receipt. Their names will then be placed on our subscribers' list, and they will be entitled to all the advantages set out above.

5 O'CLOCK P.M. MONDAY IS THE LATEST TIME FOR RECEIVING "WANT" ADVERTISEMENTS
OFFICE: 6, GREAT NEW STREET, FETTER LANE, E.C.

Tenders.

Addressed postcards on which lists of tenders may be stated will be sent post free on application to the Manager, BUILDERS' JOURNAL, *Great New Street, Fetter Lane, E.C.*

Information from accredited sources should be sent to "The Editor" at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD.

March 8, 1905. Vol. 21, No. 526.

6, Great New Street, Fetter Lane, E.C.

Summary.

Whilst giving evidence in a Government case at Exeter last week, Sir John Jackson said he had used $2\frac{1}{2}$ million cubic feet of granite in the Keyham extension works, 60 per cent. of which was Cornish, 36 per cent. Norwegian and 4 per cent. from Dartmoor. The Norwegian quarrymen worked more regularly and at half the pay of English workmen. People who put money into English granite quarries were simply throwing it into the sea. (Page 126.)

The new cathedral of Berlin has cost £500,000. Its cupola and cross reach a height of 374ft., which is about 79ft. less than St. Peter's, Rome, and about 9ft. more than St. Paul's Cathedral. (Page 127.)

The Institute memorial as to municipal architecture being placed in the hands of borough engineers and surveyors appears to be very ill-received—in some instances with laughter. (This page.)

The Bristol Society of Architects has passed a resolution in favour of architects' registration. The Sheffield Society of Architects and Surveyors has also reaffirmed its approval of the scheme. (Page 127.)

A dispute has arisen between the master-builders of Dublin and the Brick and Stonelayers' Society as to work being done by piece or measurement for persons who are not regular builders. The employers have decided on a lock-out. This affects 2,000 men. (Page 126.)

A concrete floor constructed at King Cross Wesleyan School, Halifax, by Messrs. Stuart's Granolithic Stone Co., Ltd., was recently tested with satisfactory results. The slab was 9ft. 4ins. by 3ft. 6ins. by 4ins. thick, supported at each end by a girder and on one side by a wall, and was weighted with $2\frac{1}{2}$ cwts. per square foot. The deflection at the centre was not more than $\frac{1}{16}$in., and when the load was removed the slab resumed its normal position. (Page 126.)

An interesting case in which a temperance club committee tried to shuffle out of an arrangement with an architect who prepared a design for them is given on p. 123.

In a paper on paint specifications which he read before the Aberdeen Society of Architects last week Mr. J. Cruickshank Smith, B.Sc., said although it might be natural that architects and engineers who specified or used paints should possess neither the exact scientific knowledge of the manufacturer nor the practical experience of the painter, there appeared to be a supine or neglectful attitude on the part of many towards paint questions, which, perhaps, accounted somewhat for the lack of proper wording in the framing of paint specifications — the phraseology of which appeared to have remained practically unaltered for two generations at least. (Page 122.)

Snubbing the Institute. The memorial against the growing practice of municipal and county authorities entrusting the design of important architectural work to their paid officials, which was sent out three months ago in the name of the Royal Institute of British Architects and its allied societies, appears to have met with very little grace or consideration from noble councillors in different parts of the country. As Mr. Arthur Clyne observed in a speech at the annual dinner of the Aberdeen Society of Architects last week, if local newspaper reports can be relied on, in several instances the memorial has been received with laughter. The latest instance is that of the Levenshulme (Manchester) Council, which laid the memorial on the table when it came before them last week, councillors agreeing that they could certainly do without such "officiousness." We join with Mr. Clyne that is is deeply to be regretted that in quarters where the architect is entitled to look for sympathy and support so little importance should be attached to considerations such as those urged by the Royal Institute and its allied societies.

A Garden Suburb. There has long been a concensus of opinion that, speaking paradoxically, the best way to live in London is to live out of it: but the difficulties of securing comfortable houses at reasonable rentals, in agreeable districts, and at not too great a distance from town, are very considerable. Everyone has his own opinion as to which is the best part of London to live in, but it is generally agreed that Hampstead has many attractions. Thus it comes about that a scheme is now being mooted for the formation of a garden suburb there. An influential committee has been given (by the Eton College Trustees) the option of purchasing 240 acres of land surrounding the new extension of the Heath and sloping towards the north-west: and on this land it is proposed to build houses of all sorts, from large mansions to cottages let at 7s. 6d. a week, and to lay out the suburb on orderly lines. The committee also has in view the preservation of the Heath from the speculative builder. Judging by the announcement made through the Press, there would seem to be a touch of the garden-city mania among the committee, and not a little socialism—as evidenced by their desire that "every resident may share in the church, the chapel, the public library, and the open space, not by forced artificial methods, but as inhabitants of the garden suburb"—nevertheless the idea itself is a commendable one, and we trust it may be carried out, though we fear that it is all a matter of comparative cost; and past experience does not convince us of the business qualities of that section of fanatics who pass under the names of "art architects" and "social reformers."

The Forthcoming Academy. Only about a fortnight remains before the Royal Academy sending-in day—Friday, March 24th—and we therefore take occasion to remind architects once more how desirable it is that they should let us have their drawings as early as possible. A certain few, indeed, have reached us already, but we know from bitter experience that the majority leave it till the last moment, and then we receive so many drawings that it is a very onerous task to get them reproduced and afterwards delivered at Burlington House in good time. We have even known architects to be so dilatory that their drawings have reached us the morning after sending-in day, and they have then learnt that the Academy officials will not consider any excuse whatever, absolutely refusing in every case to take in drawings after the appointed hours. May we therefore again ask for these pictures to be forwarded as early as possible.

An American Gold Medal. While referring to the Academy it is opportune to note that the New York Chapter of the American Institute of Architects has established a Medal of Honour to be awarded through the annual exhibition of the Architectural League of New York. Any architectural work in the United States, or territory belonging to it, if completed within five years previous to the date of exhibit, may be offered for consideration: but—and this is the particular point to note, bearing in mind the present unsatisfactory limitations of the Architectural Room at Burlington House—the architect or architects, in order to be eligible for the award, must present for exhibition one or more photographs of the executed work, as well as one or more drawings, including a small scale plan, and, in addition, they are to submit such working drawings of the structure as the jury may desire to examine. One almost despairs at making any radical alteration in the rules of such an institution as the Academy, but we yet hope to see photographs of architecture hung in its "whispering room"; for there can be no doubt that these afford the best of all representations of completed works

PAINT SPECIFICATIONS.

SOME notes on the specifying of painters' materials were given by Mr. J. Cruickshank Smith, B.Sc., of London, before the Aberdeen Society of Architects last week. He said there were two standpoints from which the question might be approached, namely, the manufacturing or scientific standpoint and the point of view of the craftsman-painter. Usually architects and engineers who specified or used paints had neither the exact scientific knowledge of the manufacturer nor the practical experience of the painter. This was to a great extent inevitable when one bore in mind the enormous scope and complexity of the knowledge required of the architect of to-day. Still, there appeared to be a supine or neglectful attitude on the part of many towards paint questions, which, perhaps, accounted somewhat for the lack of proper wording in the framing of paint specifications — the phraseology of which appeared to have remained practically unaltered for two generations at least. Mr. Smith read extracts from a recent paper by Mr. J. D. Crace in support of this view. Mr. Crace advocated the standardizing of workmanship or quality of work, and Mr. Smith laid stress on the necessity of drawing a clear distinction between that part of the specification which related to materials and that part which related to workmanship. This question of standardizing workmanship, he said, was one which related more particularly to the craftsman, and might well form the subject of discussion and action in the distinctively painters' associations. After reference to the extent of the evil of scamping and its relation to the system of competitive tenders and "cutting," Mr. Smith passed on to discuss present-day conditions in relation to the ordinary materials of the painter's craft, and showed that linseed oil, white lead, priming, knotting, copal varnish, &c., were terms having a very elastic meaning. He discussed in detail extracts from actual specifications and schedules, pointing out cases where these documents, as commonly worded, did not protect the person on whose behalf the architect was employed. Standardization was also required in regard to the materials of the paint trade. At present terms and trade names and descriptions were used in a vague way, and matters were little less than elastic. The old-fashioned rules were (1) to purchase goods from a respectable house and (2) to pay a good price for them — good advice, no doubt, but hardly sufficient for modern requirements. Mr. Smith then alluded to attempts made by large buyers of paints, corporations, &c., to protect themselves by buying to specification, and he pointed out how such a plan might defeat its object unless followed with prudence and technical knowledge. On the subject of protective paints Mr. Smith gave some exceedingly interesting information. Recent researches in America, conducted by officials connected with some of the great railroads, had conclusively proved that within certain limits the chemical composition of the paint was not the prime factor that determined durability. It was the physical texture, or, to be more precise, the smallness in size of the particles, that was essential. Mr. Smith quoted details of actual experiments on this subject, and said that the practical result of the investigation was that durability and comparatively low cost were not incompatible. He went on to discuss a number of interesting details, and emphasized the growing need for the standardization of paints—more particularly the protective paints.

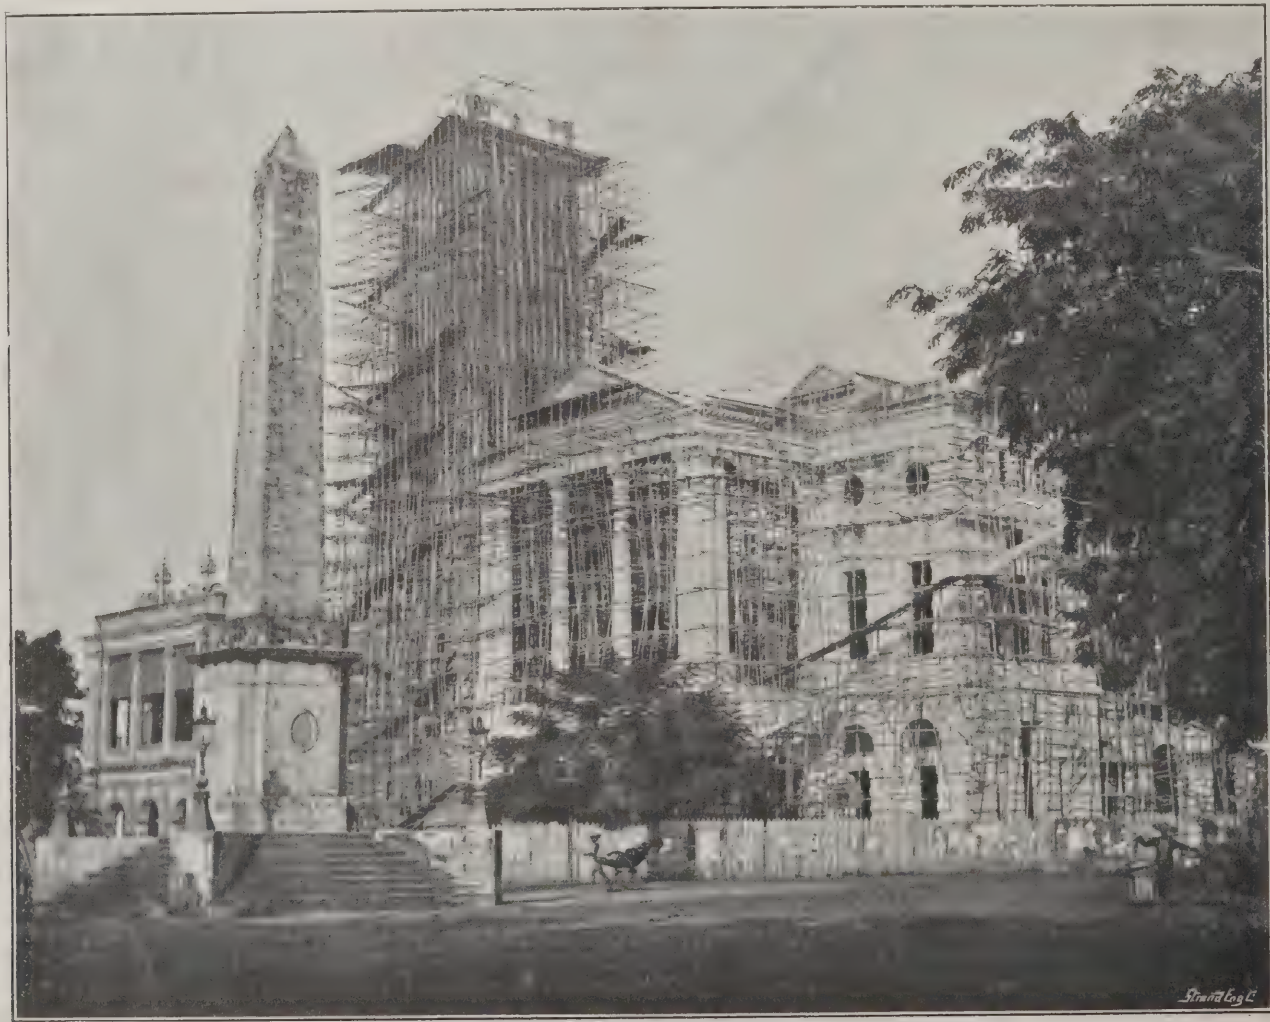
VICTORIA MEMORIAL HALL, SINGAPORE.

THE photograph below of the Victoria Memorial Hall now in course of erection at Singapore is particularly interesting as showing the Chinese method of scaffolding. This, as will be inferred, is of bamboo poles laced together. Particular attention is directed to the runways, which extend zig-zag up the sides of the tower and across the face of the building. These afford a ready, if slow, method of taking up materials as the work proceeds. On these runways it is a common practice to bind short lengths of bamboo in order to afford better foothold. The obelisk seen in the foreground was erected by Chinese and natives to commemorate the occasion of Lord Dalhousie's visit to Singapore. The building on the left is the present town hall, which is to be turned into a theatre and the façade re-erected to harmonize with the Victoria Memorial Hall, which is to be used as the town hall. The building is being erected by public subscription. The foundation-stone was laid by Sir F. E. Swettenham, late Governor of the Strait Settlements. The photograph here reproduced was taken by Mr. H. G. Allen, of Singapore.

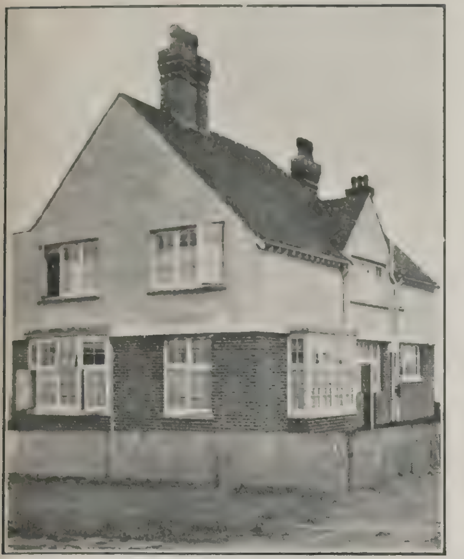
THE USHER HALL, EDINBURGH.

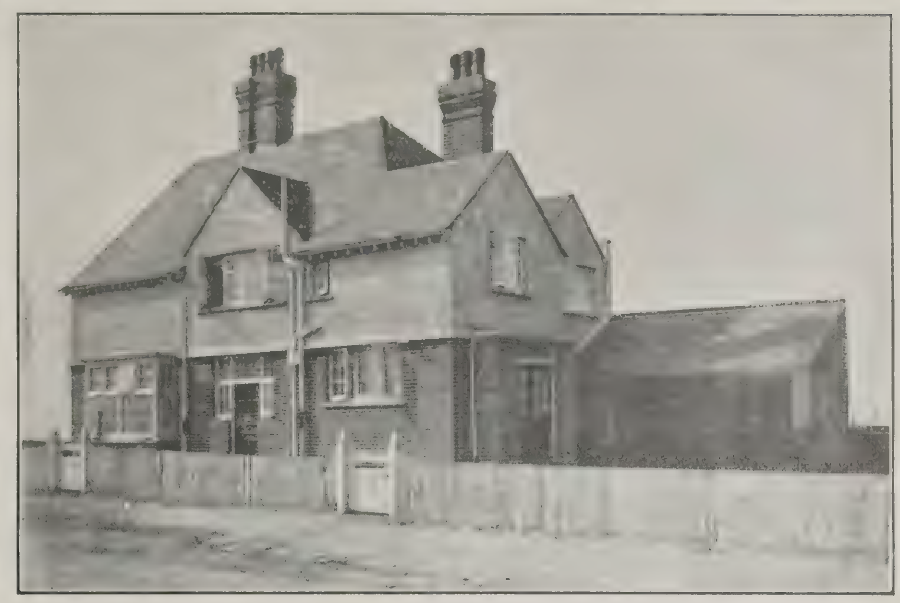
Its Acoustics.

THE proposal to pull down the Synod Hall in order to erect on the site the much-discussed Usher Hall has roused the ire of a large section of Edinburgh citizens, and a public meeting to protest against the proposal was held in the Synod Hall last week. A resolution was passed against the scheme, and a second resolution, respectfully urging on the Town Council the expediency



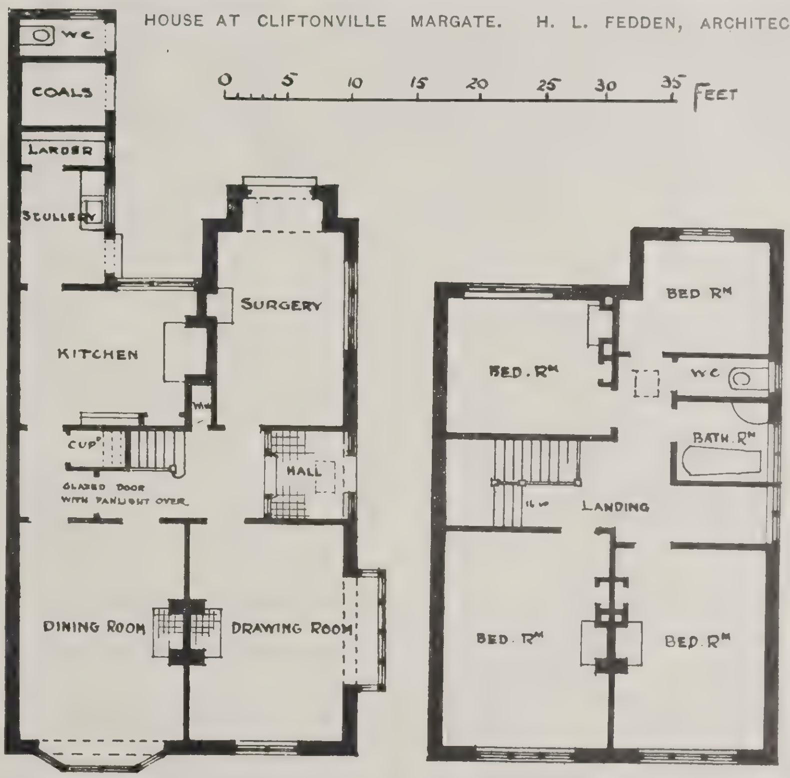
VICTORIA MEMORIAL HALL, SINGAPORE, IN COURSE OF CONSTRUCTION.





of instituting a competition for designs for the proposed hall, was carried on the motion of Prof. Baldwin Brown.

A deputation from the Usher Hall Committee, consisting of Councillor Cameron, Mr. Morham (city architect) and Mr. Williamson (his assistant) recently had a conference at Glasgow with Dr. Joseph Cowen as to the acoustics of the proposed hall. They exhibited to him the amended plan which the city architect had submitted to the Usher Hall Committee, showing extended side galleries. This plan Dr. Cowen condemned for two reasons—(1) that the hearing would be bad, and (2) that the greater portion of the sitters in these galleries would be unable to see the platform. His experience had been that for such a hall shallow side galleries were preferable. In the case of St. Andrew's Hall, those in the back seats of the side galleries could not see the platform. Dr. Cowen expressed his preference for the contract plan, provided there was a plain unbroken ceiling, and that the lunette windows were removed from the cove, as had been suggested by Mr. Cameron. A plain ceiling and cove would be favourable to good acoustics. In regard to the arrangement of seats in the orchestra Dr. Cowen gave valuable information. He suggested 9 sq. ft. for each instrumental performer, that the three lower seats of the orchestral tier should be deep, and that the depth should be diminished as the seats ascended. That was a reversal of the order in the plan. He advised that the seat of the organist should be at least 18ft. above the platform, and that there should be no seats at each side of the organ, as such an arrangement would give the conductor more command over the orchestra He strongly approved, as a matter of detail, a suggestion made by Mr. Cameron that the orchestra recess should be lined with wood. That, in his opinion, would constitute a perpendicular sounding-board for the rest of the hall. The deputation also elicited from Dr. Cowen the view that a somewhat lengthened hall was not a menace to good acoustics. The proposed Usher Hall was 5ft. less in width than the St. Andrew's Hall, but he did not think that diminished width would in any way affect the acoustics, provided always that the ceiling and the cove were kept plain. Dr. Cowen suggested that there should be a centre aisle in the hall, with side passages. That arrangement would not interfere with the architect's seating arrangements, and would be for the great convenience of the audience. The desirablility of having a pitch or rake on at least two-thirds of the area floor was approved by Dr. Cowen. The whole matter will be submitted to the Committee in due course.



HOUSE AT CLIFTONVILLE MARGATE. H. L. FEDDEN, ARCHITECT.

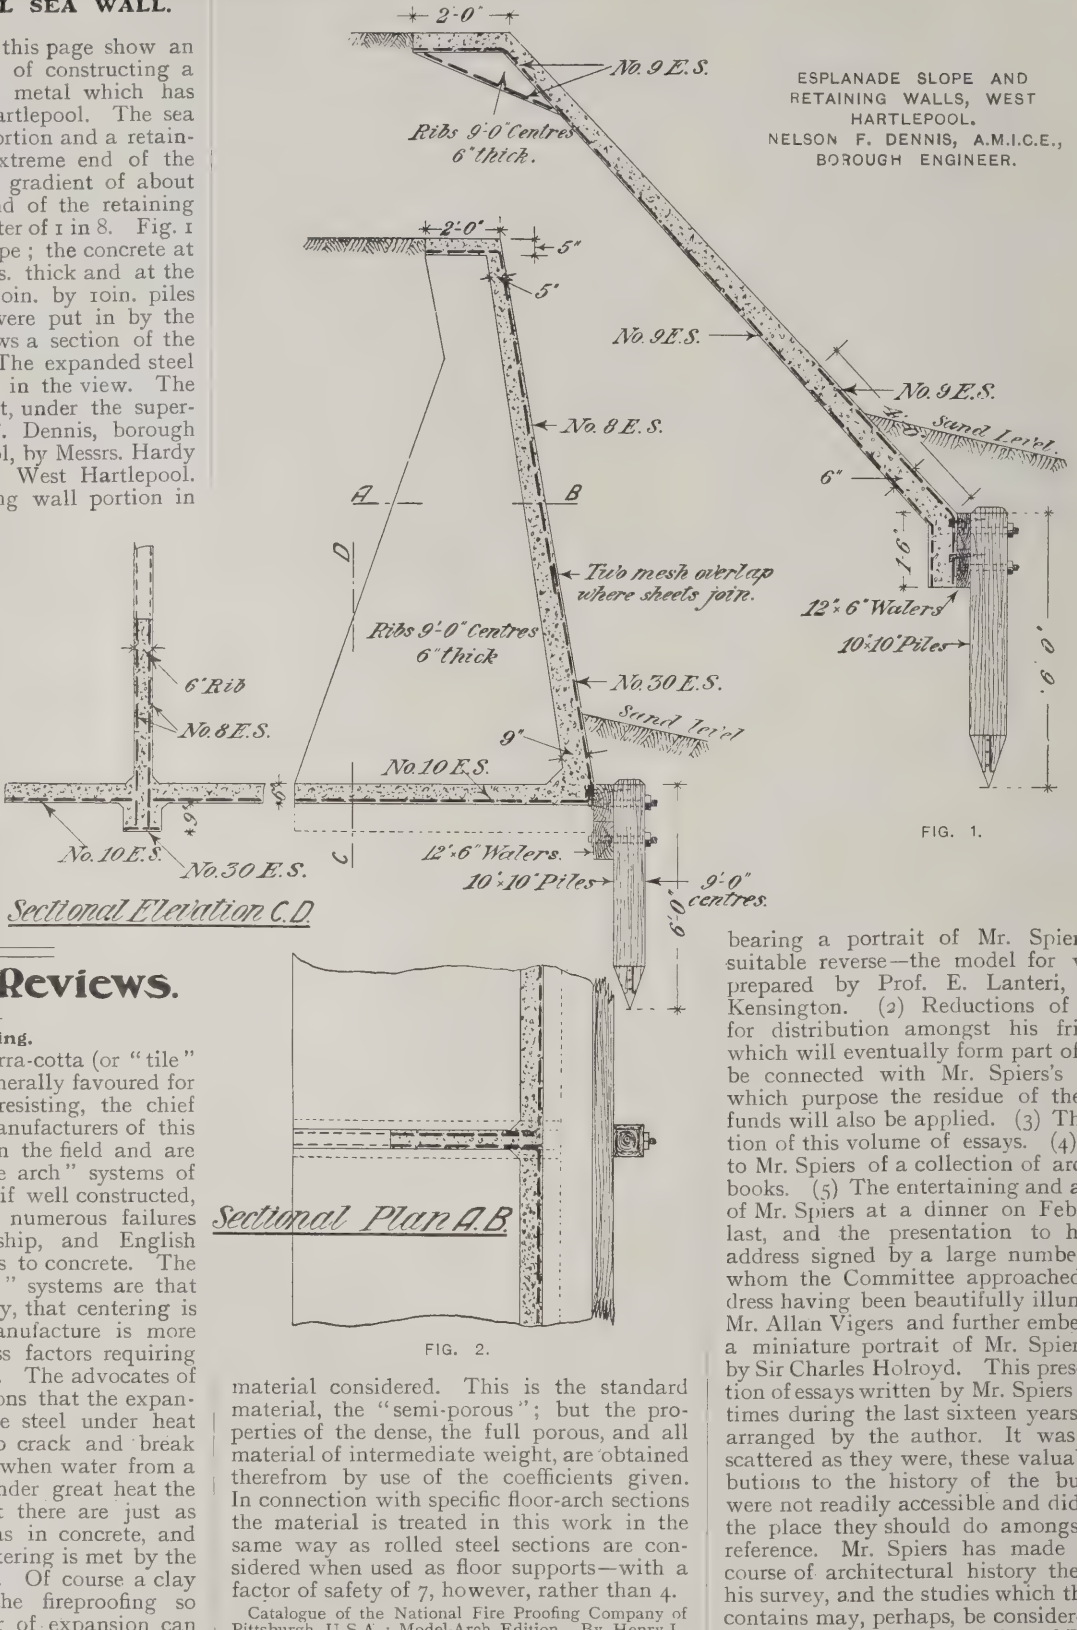
This house was completed about a year ago. The contract price was £750. The external walls are of brick 14ins. thick, rough-casted from the first floor. The roofs are covered with strawberry-coloured Broseley tiles. The house is next High Cliff Hall, on the Lewis estate, and is near the promenade and sea. The architect was Mr. H. Launcelot Fedden, of 11, Hart Street, Bloomsbury, W.C.

Law Cases.

Architects and Committees. — At the Durham County Court recently, before His Honour Judge O'Connor, Mr. J. G. Burrell, a well-known architect and surveyor in Durham City, sued Messrs. W. Willis and J. Lawson, of Langley Moor, for £20 for work done. Defendants were two members of a committee formed in 1901 for the purpose of erecting a temperance club at Langley Moor. Plaintiff applied for the office of architect and was asked how many shares he would take and what would be the extent of his donation. The approximate cost of the building (according to the secretary) would be about £1,200. Plaintiff said that if he received the appointment he would take 100 shares as part-payment of commission and would make a donation of £3 3s. His terms would be 5 per cent. on the total cost. The defendants furnished him with a rough outline, but he said it was impossible to build such a club for less than £2,000. His plans were accepted, but afterwards temporary premises were built, and when he found additions were to be made to these, he sent in his account. Defendants, however, denied liability, arguing that they were simply members of a committee which was afterwards incorporated into a company; so that they could not in equity or law be called upon to pay for the preparation of the plans, as the company had taken the responsibilities which formerly rested on the committee.—His Honour, in giving judgment for the full amount claimed, said that the fact that nothing was said about payment when the defendants visited plaintiff's office had been referred to; but if anyone went to a physician or a solicitor to obtain his advice on important matters, nothing might be said about the charge, but the bill would be sent in just the same. On application he decided that the plans should be retained by the plaintiff's solicitor, who produced them.

WEST HARTLEPOOL SEA WALL.

THE illustrations on this page show an interesting method of constructing a sea wall with expanded metal which has been adopted at West Hartlepool. The sea wall consists of a slope portion and a retaining wall portion, the extreme end of the slope portion being at a gradient of about 1 to 1 and the extreme end of the retaining wall portion having a batter of 1 in 8. Fig. 1 shows a portion of the slope; the concrete at the top of the slope is 5ins. thick and at the toe 6ins. thick. The 10in. by 10in. piles and 12in. by 6in. walers were put in by the Corporation. Fig. 2 shows a section of the retaining wall portion. The expanded steel used in the wall is shown in the view. The work is being carried out, under the supervision of Mr. Nelson F. Dennis, borough engineer, West Hartlepool, by Messrs. Hardy & Atkinson, contractors, West Hartlepool. Fig. 3 shows the retaining wall portion in course of construction. Fig 4 shows the slope in course of construction. The excavation and filling-in is being carried out by the Corporation. It will be observed that the quantity of concrete is materially reduced, and the lateral bond will enable the wall to resist the powerful destructive action of the waves that occurs in the ordinary form of sea wall by reason of a portion being first broken and the rest exposed to undermining and washed away.



ESPLANADE SLOPE AND RETAINING WALLS, WEST HARTLEPOOL.

Views and Reviews.

Fireproofing.

In the United States terra-cotta (or "tile" as it is called there) is generally favoured for rendering buildings fire-resisting, the chief reason being that the manufacturers of this material were foremost in the field and are well financed. The "tile arch" systems of flooring are also efficient if well constructed, though there have been numerous failures through bad workmanship, and English practice generally inclines to concrete. The advantages of "tile arch" systems are that work can be done quickly, that centering is saved, and that the manufacture is more regular and there are less factors requiring attention to avoid failure. The advocates of concrete raise the objections that the expansion of the clay and the steel under heat causes the clay blocks to crack and break away, that the work flies when water from a hose is turned on, that under great heat the clay fuses or twists, that there are just as many points of failure as in concrete, and that the extra cost of centering is met by the cheapness of the concrete. Of course a clay can be selected and the fireproofing so designed that the danger of expansion can be overcome, but the manufacturer of terra-cotta fireproofing does not pay attention to this point. Terra-cotta is, notwithstanding its faults, a very useful material for light floors and where quick erection is essential. The National Fire Proofing Co. of Pittsburgh, U.S.A., one of the chief makers of clay fireproofing, has forwarded us its new catalogue, which is the first attempt that has as yet been made to consider hollow terra-cotta fireproofing sections from the standpoint of the engineer. Terra-cotta of a definite character, embracing all the factors necessary in fire-resisting construction, established by a great number of impartial tests made at the School of Mines, Columbia University (weight 051 lb. per cub. inch) is the special material considered. This is the standard material, the "semi-porous"; but the properties of the dense, the full porous, and all material of intermediate weight, are obtained therefrom by use of the coefficients given. In connection with specific floor-arch sections the material is treated in this work in the same way as rolled steel sections are considered when used as floor supports—with a factor of safety of 7, however, rather than 4.

Catalogue of the National Fire Proofing Company of Pittsburgh, U.S.A.: Model-Arch Edition. By Henry L. Hinton, engineer to the Company.

Mr. Spiers's Testimonial.

This volume is the outcome of a meeting in the spring of last year of old friends and pupils of Mr. R. Phené Spiers for the purpose of initiating a movement to recognize in some tangible form the important services rendered by him during the last twenty-five or thirty years in acting as the friend and adviser of architectural students of various nationalities and helping to raise their ideals of architecture, and also to show an appreciation of the value of his published contributions to the archæology and literature of architecture. The recognition has taken the following forms:—(1) A bronze medallion bearing a portrait of Mr. Spiers, with a suitable reverse—the model for which was prepared by Prof. E. Lanteri, of South Kensington. (2) Reductions of the same for distribution amongst his friends, and which will eventually form part of a prize to be connected with Mr. Spiers's name, for which purpose the residue of the collected funds will also be applied. (3) The publication of this volume of essays. (4) A present to Mr. Spiers of a collection of architectural books. (5) The entertaining and acclaiming of Mr. Spiers at a dinner on February 27th last, and the presentation to him of an address signed by a large number of those whom the Committee approached, this address having been beautifully illuminated by Mr. Allan Vigers and further embellished by a miniature portrait of Mr. Spiers painted by Sir Charles Holroyd. This present collection of essays written by Mr. Spiers at various times during the last sixteen years has been arranged by the author. It was felt that, scattered as they were, these valuable contributions to the history of the building art were not readily accessible and did not take the place they should do amongst works of reference. Mr. Spiers has made the whole course of architectural history the object of his survey, and the studies which this volume contains may, perhaps, be considered as supplementary to his own edition of Fergusson's "History of Architecture." The essays are as follows:—(1) Mahometan architecture: (2) Stalactite (honey-comb) vaulting: its origin in Saracenic architecture; (3) Sassanian architecture; (4) review of M. Dieulafoy's work on the explorations at Susa, 1893; (5) on the influence of Byzantine art in Italy from the fifth to the twelfth centuries; (6) Saint-Front of Périgueux, and the domed churches of Perigord and La Charente; (7) Notes on some churches in Palestine and Sicily; (8) The Great Mosque of the Omeiyades, Damascus; (9) The influence of Greek Art on the Persian order.

"Architecture East and West": A Collection of Essays by R. Phené Spiers, F.S.A., F.R.I.B.A. London: B. T. Batsford, 94, High Holborn, W.C., price 12s. 6d. nett.

OBITUARY.

Mr. George Edward Lowry, of the firm of Messrs. J. & W. Lowry, builders and contractors, of Newcastle, died suddenly on February 27th while at lunch. He was 39 years of age, and was well known amongst builders, architects and contractors in the North of England. His most important recent works were the erection of the Laing Art Gallery, the rebuilding of the Exchange Hotel in Grey Street, and the Sun Insurance offices in Collingwood Street, Newcastle.

Mr. Cuthbert Brodrick died suddenly last week from pneumonia at his residence in Jersey, aged 83. Mr. Brodrick was a native of Hull, and was the architect of the Leeds Town Hall, the Hull Town Hall, the Leeds Corn Exchange and the Grand Hotel, Scarborough. On retiring from practice he devoted his time to art, and many of his paintings were exhibited in Paris.

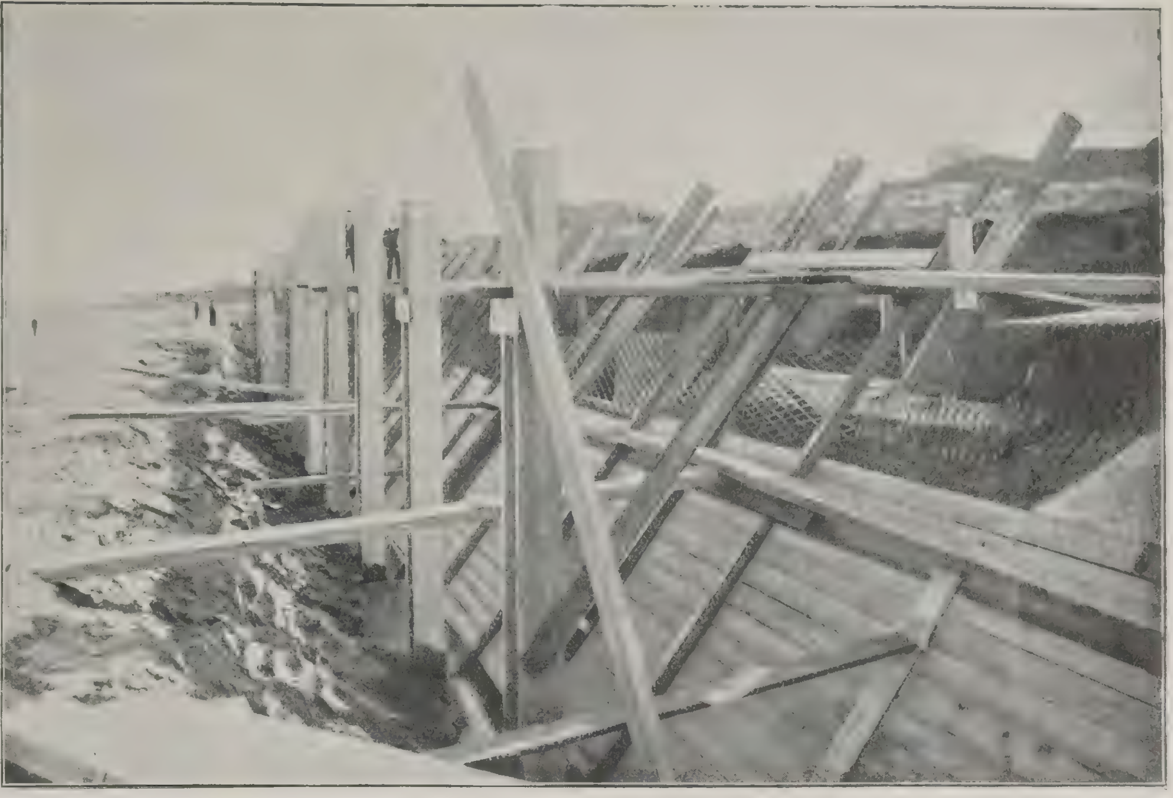

FIG. 4.—ESPLANADE WALL, WEST HARTLEPOOL, IN COURSE OF CONSTRUCTION.

Builders' Notes.

The Tariff Commission has examined the following witnesses (among others) during the last fortnight:—Granite trade, Mr. John Fyfe, Aberdeen; wallpaper trade, Mr. W. B. Huntington, chairman of the Wallpaper Manufacturers (Ltd.) and Messrs. C. & J. G. Potter, Darwen. The Commission has now held ninety-three sittings and examined 208 witnesses, representing the following industries (among others):—Iron and steel, textile, engineering and machinery (including electric engineering, hydraulic and mechanical engineering, and woodworking machinery), glass, timber, building, cement, slate, granite, furniture, brush and wallpaper. In addition to evidence of witnesses, the Commission has received written communications from upwards of 14,000 firms and associations of manufacturers, merchants and others concerned in the trade of the country.

Messrs. Doulton & Co., Ltd., of Lambeth, have been selected to supply the whole of the sanitary fittings and to carry out the plumbing work at the sanatorium now being erected for His Majesty the King at Midhurst, Sussex, from the designs of Mr. H. Percy Adams, F.R.I.B.A., of 28, Woburn Place, W.C.

The British Uralite Co., Ltd., of 50, Cannon Street, E.C., send us a catalogue containing numerous illustrations of buildings in which Uralite has been employed for such purposes as roofs, ceilings, partitions, exterior and interior walls, door panels, &c. The illustrations range from palatial city offices to small colonial bungalows, and from huge tea-plantation buildings to fowl-houses and meat safes, affording unmistakable evidence of the progress which the material has made in the building world. The letterpress is commendable for its brevity. All who are interested in fire-resisting building construction should write for a copy of the catalogue. They can read it without feeling tired.

Builders' Clerks' Benevolent Institution.—The report for the past year shows that the receipts amounted to £777 4s. 4d. The expenditure included a sum of £606 devoted to pensions of £24 each to twenty-four widows and of £30 to one aged clerk. A sum of £5 was granted for temporary relief, and payments were made towards the support of two orphans. Mr. J. Carmichael has been elected president for the current year.

The London Building Acts Amendment Bill and the Bill promoted by the Corporation for providing means of escape from fire in City buildings were opposed last week on second reading in the House of Commons, and they accordingly stand over until Tuesday next, March 14th, at 9 p.m.—At the Guildhall

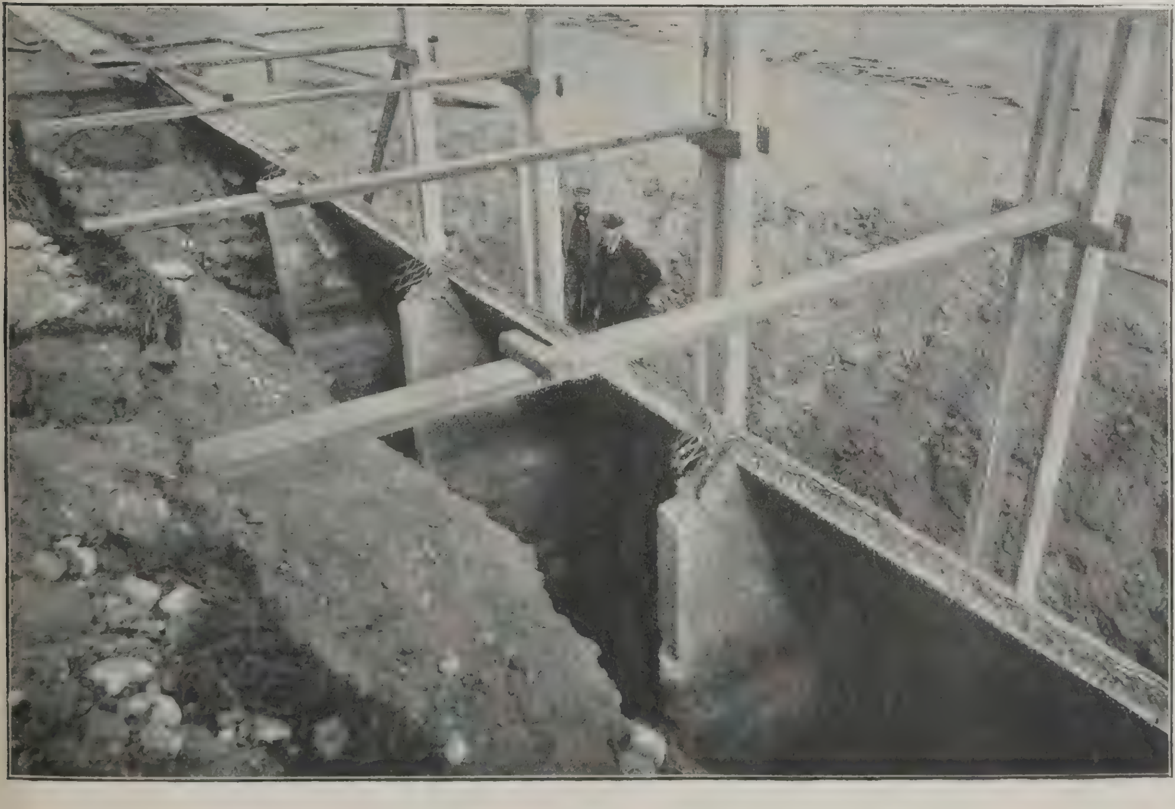

FIG. 3.—VIEW OF ESPLANADE WALL FROM BACK, SHOWING RIBS.

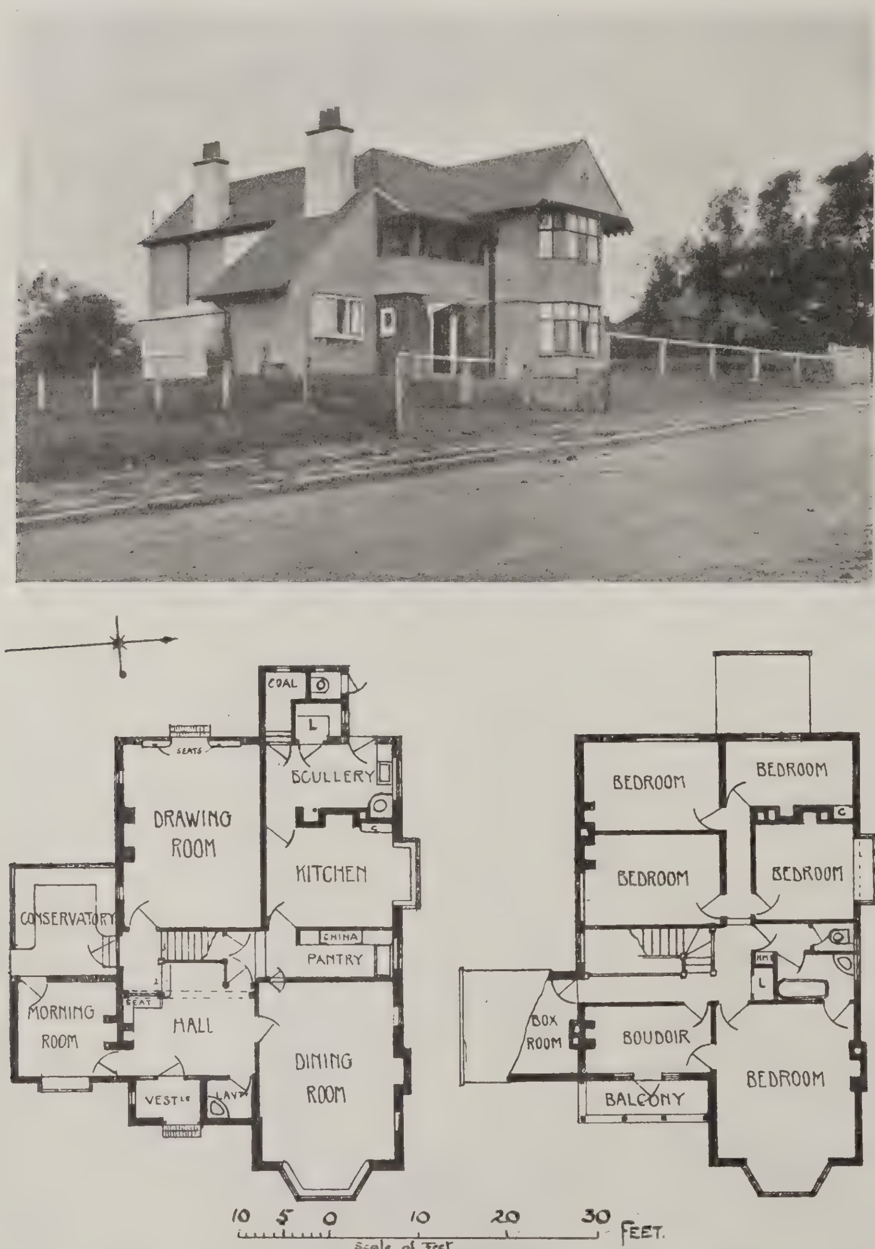
meeting on Friday resolutions were passed condemning the Council's Bill and expressing the opinion that any proposed alterations or amendments to the London Building Acts should be submitted to the local authorities before being presented to Parliament.

A Crane Accident.—On Wednesday last a large crane used in hoisting masonry at the new Waldorf Theatre, Strand, snapped as a ton of stone was being hoisted to the top of the building. The stone fell with a crash into the roadway, but, fortunately, there was no one standing or passing underneath it at the time. Two men, however, who were in the act of receiving the masonry were injured.

Sheffield Master-Builders' Association.—At the annual dinner held last week Mr. J. D. Cook said that during the long spell of bad trade the National and Yorkshire Federations of Building Trade Employers had not endeavoured to reduce the wages of the workmen, and had endeavoured to give a fair day's pay for a fair day's work. The bright star of conciliation was in view to-day, and he hoped that strikes and lock-outs would soon be things of the past. Alderman Jessop, ex-president of the National Federation, said it was important just now to carefully watch affairs in Parliament, for a Bill was to be introduced which proposed to fix a minimum wage. Unless a stipulation were made that the employees should also give a fair day's work, such legislation would be altogether unfair. The National Council were endeavouring to bring about a closer union with the operatives, in the hope that, by means of conciliation boards, strikes and lock-outs might be prevented in future.

English versus Norwegian Granite.—In the course of the arbitration proceedings last week at Exeter between the Government and the representatives of the Calmady-Hamlyn Estate in regard to the proposed acquisition by the former of a tract of land on Dartmoor for military purposes, Sir John Jackson gave evidence. He stated that he had used large quantities of granite in connection with contracts for public works which he had undertaken during the past seven or eight years. At the Keyham extension works he had used 2,500,000 cub. ft. of granite, of which 60 per cent. was obtained from Cornwall, 36 per cent. from Norway and 4 per cent. from Dartmoor. Whilst Norwegian granite was brought into England in comparatively small quantities prior to ten years ago, during the last ten years it had been imported to such an extent that it had absolutely done away with the British granite trade where the stone was required in large quantities. Asked what advantages the Norwegians had, Sir John Jackson said that the granite was of the best, could be shipped direct from the quarry, and there was very little waste. Moreover, "they have more efficient men working in Norway at half the pay. I do not say they work better; they work more regularly. Englishmen go off drinking so often. The Norwegian takes a fortnight about once a year, drinks for a fortnight, and has done with it. The consequence is the work goes on more regularly." People who put money into granite quarries in England were simply throwing it into the sea. The cost of carriage from Norway was 8s. or 10s. a ton.



HOUSE AT WESTCLIFF-ON-SEA. DOUGLAS H. SMITH, ARCHITECT.

This house has recently been erected for Mr. H. J. Cullum. The materials employed are cement rough-cast coloured a medium buff, local red brick facings, with a roof of bright red Essex sand-faced tiles. The hall and dining-room are panelled in dark oak. The architect was Mr. Douglas H. Smith, and the contractors were Messrs. Whur & Campkin, of Southend-on-Sea.

"Sanalene" is the latest introduction of Messrs. Aspinall's Enamel, Ltd. It has a very fine surface, will not crack or peel off, is non-poisonous, and can be obtained either as a glossy or flat enamel. Samples can be obtained from the makers, whose address is New Cross, London, S.E.

Building Trade Dispute in Dublin.—A dispute has arisen between the Brick and Stonelayers' Society and the Master-Builders' Association of Dublin in reference to piecework, and the master-builders have decided on a lock-out. This affects 2,000 men—700 Society members, 300 carpenters and 1,000 builders' labourers. The dispute appears to be due to an unwritten rule of the men's society that their members were free to do work by piecework or measurement for any persons who were not regular builders, with the result, as the masters affirm, that such persons can do speculative house-building work at prices that the regular builders could not, and in consequence a very large amount of work of this class has passed out of the hands of the regular builders. The men have passed a resolution "that piecework, especially sub-contracting, is an injustice to the general public, as it would establish a sweating system, and, as a result, bad workmanship, which, in the building trade, means a source of danger to public life and interest, and in view of the attitude of the various public bodies we consider it hostile to public reform."

Testing a Concrete Floor.—A floor at the new Wesleyan Sunday School, King Cross, Halifax, constructed by Messrs. Stuart's Granolithic Stone Co., Ltd., of London, E., was tested recently. (The company has just removed its Manchester offices from 49, Deansgate to Great Bridgewater Street.) The gallery classrooms of the school, 12ft. by 11ft., are covered with one slab of concrete 4ins. thick without any intermediate steel girders. Some doubt had been expressed as to the adequate strength of these floors, and in order to satisfy the Corporation authorities the contractors requested the building inspector (Mr Goldthorp) to select any floor. Mr. Goldthorp selected a slab in a balcony passage at the rear of the school, the dimensions of the slab being 9ft. 4ins. by 3ft. 6ins. and 4ins. thick, supported at each end by a steel girder and on one side by a wall, the outer edge being entirely unsupported. This slab was weighted with thirty-one 2 cwt. sacks of cement, representing (with the weight of the floor) an actual load of $2\frac{1}{2}$ cwts. per sq. ft. At this weight the deflection at the centre was not more than $\frac{1}{16}$in., and when the load was removed the slab resumed its normal position. As this weight represents more than double that of a closely-packed crowd of men, and the slab selected was admitted to be the weakest in the building, all fears as to the strength of the other floors were set at rest. The test took place in the presence of Messrs. Leslie, Munro and Athol Stuart (representing the company), Mr. Goldthorp, and Mr. A. G. Dalzell, the architect, all of whom were perfectly satisfied with the result.

Keystones.

Mr. Edwin T. Hall, F.R.I.B.A., has been elected deputy-chairman of the Board of Estates Governors of Dulwich College.

New Banking Premises at Plymouth for the Capital and Counties Bank, Ltd., have been erected from designs by Mr. A. G. Bewes, A.R.I.B.A.

Ritz Hotel, Piccadilly.—The name of Mr. John P. Bishop, A.R.I.B.A., should be coupled with that of Messrs. Mewes & Davis as architects of this hotel.

Fotheringhay Church has been reopened after restoration of the clearstory and parapets of the nave roof and the repair of the oak roof of the nave. £5,000 is still required to complete the work of preservation.

Messrs. Norton & Gregory, Ltd., of Castle Lane, Buckingham Gate, S.W., have issued a very neat booklet dealing with their "permanent black line," sepia, cyano, ferro-gallic and ferro-prussiate processes of photo-copying; also their drawing materials and furniture, and double-action spring hinge.

Suffolk County Hall.—It has been decided that the new council-chamber in the county buildings at Ipswich shall be built of Suffolk oak. It was recently proposed that the county hall should be built entirely of this material by means of each Hundred contributing one oak tree, but it was found that this could not be carried out.

The old Proposals for Restoring the Parthenon appear to be reviving in some quarters. At all events, they have taken the alarm in Paris and a formal protest has been drawn up and is to be placed in the hands of the president at the forthcoming Archæological Congress in Athens, with a request that he will transmit it to the King.

A Skyscraper Church—the Broadway Tabernacle—has been erected at the corner of Broadway and Fifty-seventh Street, New York, on a lot 100ft. by 100ft. The building is of steel construction ten storeys high. While the general design is of an ecclesiastical character, the building has numerous classrooms, a library, baths, gymnasium and kitchen—all necessary adjuncts of church work in America.

Islington Library Competition.—The following ten architects have been nominated to compete for the new central library for Islington:—Messrs. Reginald Blomfield, William Flockhart, Henry T. Hare, Mervyn Macartney, Philip A. Robson, A. W. S. Cross, Sydney K. Greenslade, Arthur Keen, Leonard Stokes and Prof. Beresford Pite. An honorarium of £20 will be paid to the unsuccessful competitors, except those appointed for the branch libraries.

Glasgow Institute of Architects.—At the recent quarterly meeting of this Institute the following clause in regard to repairs after electrical work, proposed by the Institute of Measurers for embodiment in specifications of contracts, was approved:—"The contractor to do all mason, brick, joiner, plaster and other works required to carry out and complete his contract, and to make good at his own expense all damage caused by his operations, and he shall be bound to employ the plasterer engaged on the job at the usual jobbing rates." It was agreed to inform the R.I.B.A. that this Institute would be glad if, by putting a clause in the schedule of professional practice as to charges, or in some other way, all doubt as to the ownership of drawings could be removed. It was remitted to the Council to draw up a form of recommendation to the members of the Institute regarding the joint-diploma in architecture recently established by the Glasgow School of Art and the Technical College.

Charing Cross Railway Bridge is to be widened.

The Tower of St. George's Church, Ramsgate, is in a dangerous condition of decay, and a scheme of restoration (estimated to cost £4,800) is now on foot.

Messrs. Oetzmann & Co. have purchased the entire stock of Messrs. Norman & Stacey, Ltd., of 252 to 256, Tottenham Court Road, and are now removing it to their own showrooms and galleries at 62 to 79, Hampstead Road.

Sanitation of Country Houses.—In our report of the paper on this subject read before the last meeting of the Architectural Association we gave the author's name as Mr. J. Osborne Smith, A.R.I.B.A., whereas it should have been Mr. Frederick J. Osborne Smith, A.R.I.B.A., F.R.S.I. We regret the error.

Mr. John Belcher, A.R.A., has designed a large palm house, bandstand and ornamental fountain, which is to be erected in Williamson Park, Lancaster, at a cost of between £5,000 and £6,000. The building will be 120ft. high, with terraces, balconies and turrets, and an octagonal dome. This is to be Lord Ashton's gift, in addition to his recent offer of a new town hall and other buildings costing £100,000.

Partnership Assurance.—A pamphlet by Mr. T. P. Wansbrough on "The Case for Partnership Assurance" has been issued by Messrs. Charles & Edwin Layton, Farringdon Street, E.C., price 1s. 6d. The death of a member of a firm occasions such monetary inconvenience and not infrequently financial disaster to the remaining members that any serious attempt to solve the difficulties of the subject is one of general interest. Mr. Wansbrough exposes the inadequacy of elaborate clauses in partnership deeds, and shows that the only method by which the rival claims can be fully safeguarded is assurance.

Snow Houses.—Mr. F. G. Speck explains in a paper that the houses of the Eskimo are built of snow blocks cut into cakes of the required size; the ground plan laid out in the form of a circle. Now the blocks, beginning from a certain point in the circumference of the base, are cut gradually of less height, so that when the same place is reached in laying the first course the last blocks are so small that they stand merely a few inches above the ground. The simple principle is that of a spiral. Each course is laid on the former till the vault begins to assume definite form. The process is continued, the walls slanting towards the geometrical centre till the keystone is ready to be placed. No scaffolding or support is used.

Berlin's New Cathedral has been ten years in building. The site is close to the eastern arm of the Spree and necessitated extensive piling. The cathedral is built of Silesian grey sandstone in the style of the Italian Renaissance, and has a central cupola with cross reaching to a height of about 374ft.—nearly 79ft. less than St. Peter's, Rome, and over 9ft. more than the height of St. Paul's. The total length of the building is 374ft., and its breadth nearly 80ft. The chief façade and the main entrance on the west side are characterized by an elaborate arrangement of columns and entablature, which is repeated in the second storey supporting the central dome, the dome itself flanked by four minor cupolas surmounting open square towers, the cornices of which are also supported on columns. Over the arch of the great portal is a colossal statue in bronze by Schaper representing Christ in the attitude of benediction. The cathedral has cost £500,000 (voted by the Prussian Diet) and represents the first Protestant Dom erected in modern Germany. The architect, Herr Raschdorff, has been decorated by the Kaiser.

The Old Kent Road Fire Station, just rebuilt upon an enlarged scale by the Works Department of the London County Council, has cost £10,650, with £1,320 for additional land.

Alarming Reports about the Monument in the City of London have been circulated. It has been stated that there is a crack of 6ins. in the abacus, but the fact appears to be that this is but an opening where the cement has worked out. The three horns of the copper dragons, however, seem to be in a dangerous state.

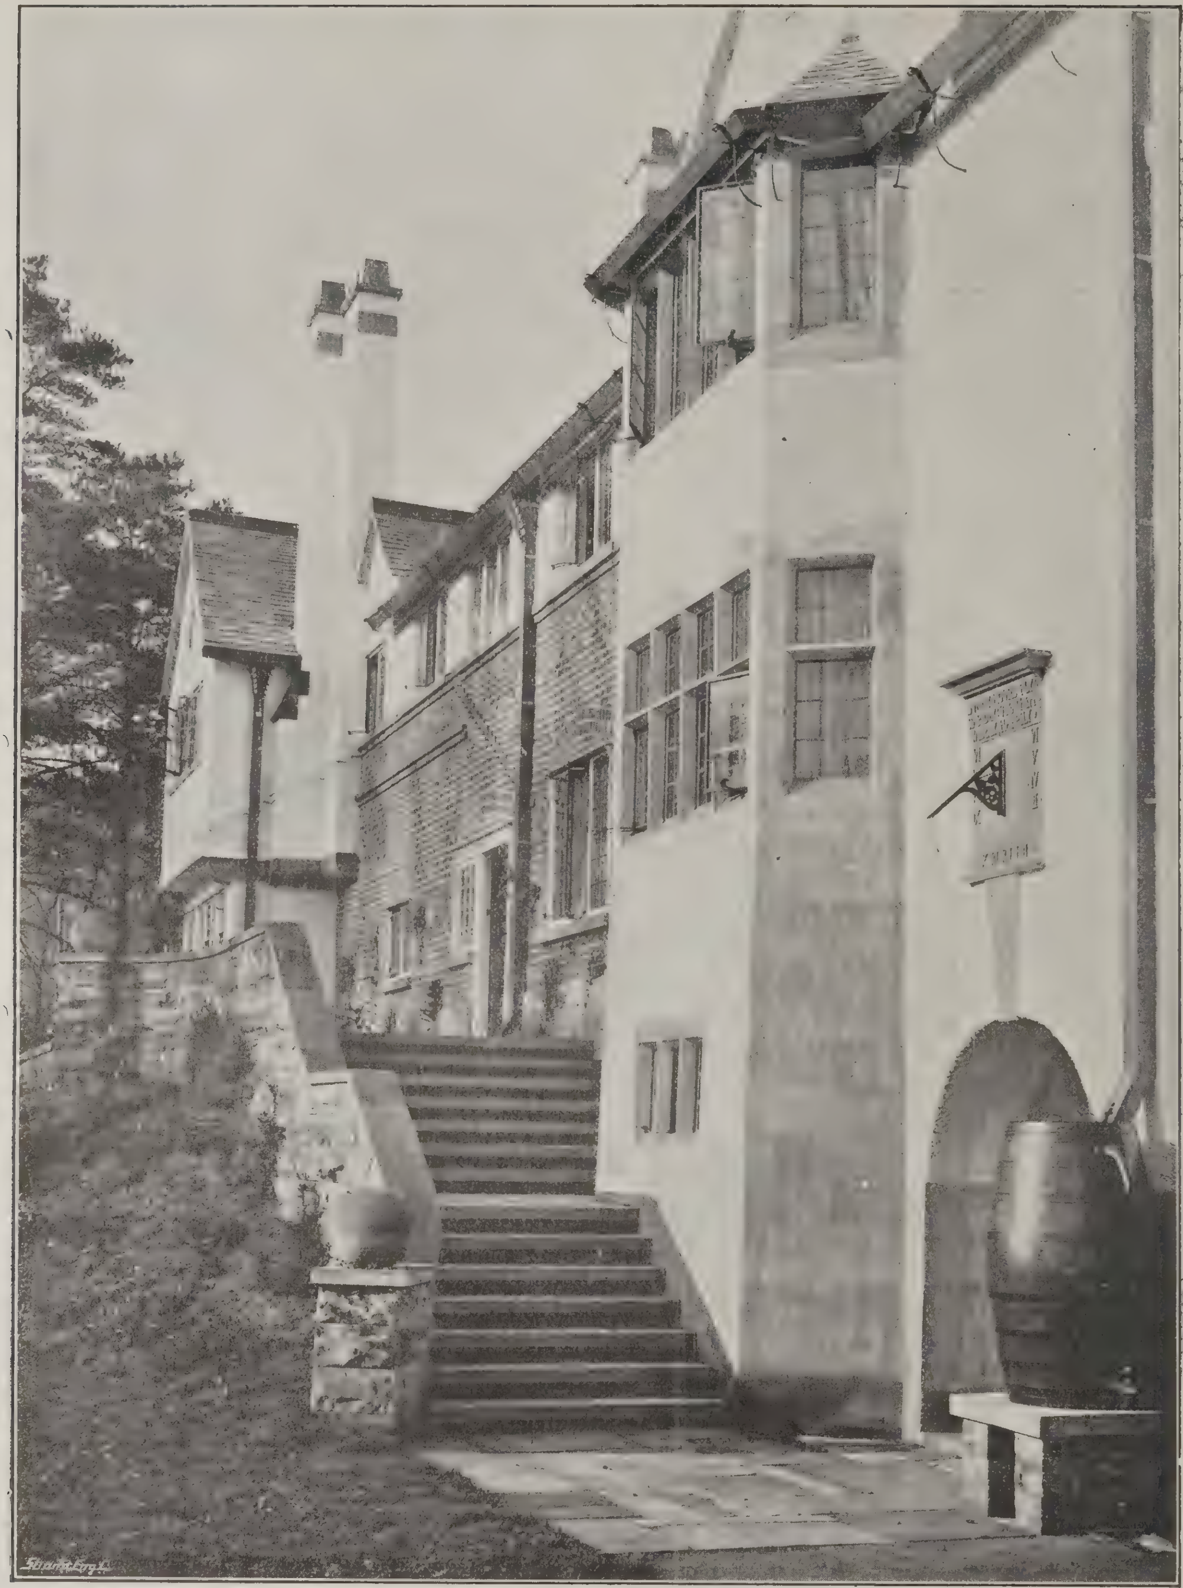
Costly Street Widening.—The Kensington Borough Council has decided to widen Church Street and Silver Street, leading from Kensington High Street to Notting Hill Gate, at an estimated cost of £285,000. The thoroughfare will be made 54ft. wide. The borough council has consented to pay one-third of the nett cost of the improvement.

Alnwick Infirmary Competition.—Mr. Frank Caws, F.R.I.B.A., the assessor in this competition (limited to architects in Northumberland and Durham), has awarded the first premium of £100 to Mr. Douglas, of Alnwick, and Messrs. Boyd & Groves, of Newcastle, joint architects; the second premium of £30 being divided between Mr. Stephen Piper and Messrs. Armstrong & Wright, of Newcastle.

Registration.—On February 27th Mr. A. W. S. Cross and Mr. George Hubbard, members of Council of the R.I.B.A., read papers on "Registration" before the Bristol Society of Architects. A discussion followed and a resolution was carried unanimously "That this Society, having heard the respective papers of Prof. Beresford Pite on one side and of Messrs. Cross & Hubbard on the other, is distinctly in favour of the principle of the statutory qualification and registration of architects." On Thursday Mr. Cross and Mr. Hubbard put their views before the Sheffield Society of Architects and Surveyors, when a resolution was passed "that the Society again affirms the necessity for the statutory qualification of architects, and trusts that a satisfactory Bill will be put forward as soon as possible."

Northern Architectural Association.—At the last meeting of this Association Mr. W. H. Wood (of Messrs. Oliver, Leeson & Wood) delivered a lecture on "The Design and Construction of the Spire of Newcastle Cathedral." Mr. Wood said this was of Scottish form, and there were only four other known examples—St. Giles's, Edinburgh; King's College, Aberdeen; one at Linlithgow, and one in London, by Wren. St. Nicholas's was infinitely the most elegant example of them all; it was repaired at various times—by Sir Gilbert Scott (who put in entirely new foundations and effected a lot of tying up, necessary for the big arches to carry the lantern), and lastly in 1895 by Messrs. Oliver, Leeson & Wood, when portions of the pinnacles were rebuilt and the vane was re-made.

The latest Skyscraper is the "New York Times" building. It measures 419ft. 9ins. over all. The Park Row building is 410ft., but is higher from the pavement level, being 380ft., while the "Times" building is 362ft. 8ins. This building is notable in more ways than one, however. It faces four streets on a site comprising 5,405 sq. ft. The New York subway traverses one corner of the upper basement, and a local station at this point permits the tenants of the building to enter the subway without going on the street. The building has a total floor space of 116,349 sq. ft, 3,712 tons of structural steel, a smokestack 389ft. high, a 30-ton steel girder (the heaviest girder ever used in the construction of an office building), an elevator rise of 326ft., and many other noteworthy features.



WOODGARTH" KNUTSFORD, CHESHIRE: SOUTH FRONT AND TERRACE STEPS FROM PERGOLA.
THOMAS AND PERCY S. WORTHINGTON, ARCHITECTS.

OUR PLATES.

"WOODGARTH" has been built for Mr. George Wragge on the outskirts of Knutsford, a small Cheshire town to which Cranford has assigned a niche in literature. A wood of firs and beeches, oaks and birches has been sufficiently cleared to receive the house and forecourt, and the plan shows how the south front overlooks a sunk garden that was originally a large sand-pit, from which steps lead up to the terrace and down to a grass path along a wooded ravine. A pergola follows the curved line of the sand-pit, with a thatched garden-house in the centre. This arrangement allows the blooms of roses and climbers, so often visible on a pergola, to be seen from the windows of the house. Externally the walls of the house are rough-casted, with base and dressings of Alderley stone, and the roofs of stone tiles. The gutters and down-spouts are of English oak, and the heads have each a carved panel and angles decorated with diaper patterns. Internally, the woodwork on the ground floor and staircase is of oak in panelling, floors and doors, &c., and the plaster decorations have been modelled from the architects' design by Mr. Miller, of Messrs. Earp, Hobbs & Miller. The general contractors were Messrs. Isaac Massey & Sons, of Alderley Edge. The metal-work in iron, copper, brass and lead, and the casements, glazing and decorative colouring, have been done by Mr. Wragge himself. The house has been built from the designs and under the superintendence of Mr. Thomas Worthington and Mr. Percy Scott Worthington, architects, of Manchester.

The East Ham Technical College and Secondary Day School adjoining the Town Hall is to be opened by the Prince of Wales on March 18th. The building has cost £24,000.

THE TIMBER TRADE.

London Market in February.

FEBRUARY was a quiet, uneventful and rather disappointing month for the London wood trade. The Dock deliveries were better than they were in January, but are still about 1,500 standards less than the very moderate figures for February, 1904, and when compared with those, say, for 1902 they show a reduction in the first two months of the year of about 5,000 standards per month. The overside deliveries were a little better, but at this time of year they are quite an unreliable test of consumption, so that the very general expectation of an improvement in our trade is not at present evident, but remains to be justified in the future. There was practically no change in prices in London during the month. Messrs. Churchill & Sim state that the general business in wood for importation from abroad during the coming season has been much less active than in January. Swedish shippers in particular have refused no reasonable offers for deal sizes, and a small Cape demand which shows now some signs of expanding has been met very cheaply. For battens and scantlings, quotations have been fully maintained and now look fairly assured for the season. Large sales of prepared boards continue to be effected at rates which have little to be desired from a buyer's point of view. Whitewood remains firm in sympathy with spruce, for which quotations have been freely advanced in consequence of an unusually hard winter in Canada. Business in pine deals is much restricted by a high cost and lack of demand. Freight rates remain very low from every quarter.

Messrs. Denny, Mott & Dickson, Ltd., state that February produced the natural reaction in feeling with those who, having bought, found no very marked increase in the demand for consumption. On the whole, however, there was a steady undertone of improved confidence generally, and although the increase in the savings of the country finds expression in increased investments in Stock Exchange securities—as it is already doing—the stimulus to general trade is bound to follow, and the demand for wood for renewed house, factory, ship and other constructive work should soundly, if slowly, develop as the year proceeds—given always that no abnormal political event checks the reviving confidence of investors.

The abstract of stock, consumption, &c., for February, published by Messrs. Foy, Morgan & Co., is given in the table at the foot of this page.

Dock Stocks in February.

The stock of wood in the public docks of London on February 28th was as follows :—

	Pieces.
Foreign deals and ends	1,655,000
Do. battens	2,533,000
Pine deals and battens	1,211,000
Spruce do. do.	1,022,000
Boards, rough	3,691,000
Do. prepared	7,157,000

Totalling 17,269,000 pieces, as compared with 20,449,000 in 1904, 17,476,000 in 1903 and 18,967,000 in 1902.

In other kinds the stock was as follows :—

Foreign wainscot logs	257 pieces.
Do oak timber	890 loads.
Do. fir timber	1,053 do.
Colonial oak timber	1,492 loads.
Do. birch timber and planks	2,367 do.
Do. elm and ash timber	810 do.
Do. yellow pine	455 do.
Do. red pine	243 do.
United States pitch-pine timber	20,610 do.
Do. do. deals	54,000 pieces.
East India teak	8,287 loads.

The deliveries for January and February were as follows :—

	Pieces.
Foreign deals and ends	564,000
Do battens	987,000
Pine deals and battens	164,000
Spruce do. do.	241,000
Boards, rough	1,100,000
Do. prepared	2,366,000

Totalling 5,422,000 pieces, as compared with 5,835,000 in 1904, 6,923,000 in 1903 and 7,056,000 in 1902.

The deliveries for February were as follows :—

	Pieces.
Foreign deals and ends	278,000
Do. battens	537,000
Pine deals and battens	79,000
Spruce do do	136,000
Boards, rough	538,000
Do. prepared	1,281,000

Totalling 2,849,000 pieces, as compared with 3,059,000 in 1904, 3,605,000 in 1903 and 3,751,000 in 1902.

Deliveries to Craft.

The deliveries direct from ship to craft for January and February were : —

	1905. P.s.h.	1904. P.s.h.	1903. P.s.h.	1902. P.s.h.
Deals and battens	3,431	3,957	2,591	3,761
Boards	1,292	916	1,438	12,003

and for February :—

Deals and battens	1,797	1,325	661	1,388
Boards	898	514	759	1,423

Soft Woods.

Russian Deals and Battens.—There was no change in the prices for Russian deals or battens. They have varied considerably in accordance with quality and condition, but the basis price remains unaltered. A large number of small sales continues to be made for arrival, for each of which the selling agents have to work very hard.

Swedish Deals.—Messrs. Churchill & Sim state that there is no change to report in the prices for Swedish deals or battens in London during February. The demand was poor, but the stock was very moderate. Prepared boards fell very steadily in price throughout the month, though there was nothing in the position of the London market to account for this. Probably the low cost of boards for shipment from abroad during the season is being rather more than discounted.

Norwegian Boards.—There was a steady fall in the prices for Norwegian prepared boards in London throughout February. Here again figures of the stock or consumption do not furnish a reason, and the fall was so unexpected that the ordinary flow of the supply has not yet been checked ; but clearly it must affect the usual shipments to this market in the spring and summer.

Finnish Battens.—Prices in London remain steady at previous rates ; while for the coming season the probability seems to be that the demand will continue to be fully equal to the easy absorption of the quantities offering for shipment on a very reasonable basis.

Canadian Deals and Spruce.—The demand for pine deals was very small, and prices dragged along just under the January rates. For spruce there has been no change so far, prices having been kept steady by competition with Riga and Galatz whitewood. There has, however, been some excitement among the lower port shippers, in consequence of the abnormal severity of the winter in New Brunswick and Nova Scotia, which has not only hindered the transportation to the shipping ports of the supplies of spruce, birch, &c., cut for early shipment, but has also prevented the work in the forests on the production for shipment later in the season, so that contracts already made cannot be carried out, and shippers are nervous about contracting again ahead. There is no change to report in the prices of oak or yellow pine timber in London, while for birch, elm and ash prices have been a point or two down in February. For birch, at any rate, there is likely to be a prompt and sharp reaction. There was a fair delivery of sawn timber from the docks, and the stock is again reduced, while orders ahead are coming in with rather hopeful persistence. There was practically no change in prices during the month beyond those due to variation in the respective quality of the parcels sold. For deals the demand has been very small and prices have dropped again, remaining at a very unsatisfactory level. These shipments consist almost exclusively of the larger sizes.

Hardwoods.

Teak.—Messrs. Denny, Mott & Dickson report that the landings in the London docks during February consisted of 976 loads of logs and 423 loads of planks and scantlings, or a total of 1,399 loads, as against 591 loads in February, 1904. The deliveries into consumption were 419 loads of logs and 360 loads of planks and scantlings—together 782 loads, as against 788 loads for February, 1904. The increase in the import of logs has been due to the arrival of a small sailing cargo from Bangkok, which feature, however, is not likely to be repeated for a long time to come, owing to the small stocks at the shipping ports not permitting the shippers to commit themselves to the charter of even very small sailing ships. The market has, therefore, only to look to hand-to-mouth parcels by steamers for this year's supplies ; and such chance shipments are mostly sold to the consumer whilst on the way, so that the present meagre dock stocks will tend to still further decrease.

Mahogany.—Messrs. Denny, Mott & Dickson state that this market exhibited little feature during February. The imports were quite sufficient for the moderate demand ; and perhaps prices are slightly weaker, without, however, any appreciable decrease in the confidence of holders in the general soundness of the position. Messrs. Leary report that during the last fortnight of February imports were on a more liberal scale, and the stocks were thereby sufficiently replenished. Only one auction took place, the results being good for all except the most inferior wood.

Odessa Oak.—There have been important enquiries on the market for this wood, and the demand promises to exceed the estimate of next season's supplies. The very marked growth in the appreciation of consumers for Odessa oak is greatly due to the special care taken in the shipments by the chief shippers.

American Whitewood.—Lumber.—A fair market, with first and medium qualities in chief request ; culls have been rather over supplied ; values range from 2s. 3d. to 3s. 6d. per cubic foot for first quality ; 1s. 9d. to 2s. for clear saps, 1s. 6d. to 1s. 9d. for medium, 1s. to 1s. 3d. for culls.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Graving Dock.

BRADFORD.—HYDRAULICS writes: "Draw cross-sections of entrance and centre of a graving dock 60ft. entrance, the substratum being water-bearing sand and gravel."

We have referred before to the abuse of these "Enquiries Answered." This is another instance of it.

S.K. Examinations in Building Construction.

DORCHESTER.—H. M. T. writes: "Where can the examination questions in architecture (and, if possible, answers) of the South Kensington Board of Education of current years be obtained?"

Questions and answers have been published in our columns. See the replies on p. 226 of the issue for October 26th, 1904, and on p. 116 of the issue for March 9th, 1904.

Safe Load on Projecting Pin.

BRADFORD.—HYDRAULICS writes: "A steel pin 3ins. diameter overhangs 3ins. It is firmly fixed at other end. What load applied uniformly, such as the tension of a well-fitting eye-bar 3ins. thick, will the pin bear so as to give extreme fibre stress of 6½ tons per square inch?"

Let P = load in lbs., d = diameter of pin in inches, l = length of pin in inches, f_t = maximum safe tensile stress in tons per sq. in., say 6·5, f_s = maximum safe shear stress in tons per sq. in., say 5. The simplest case would be when the pin was in single shear.

$P = \frac{\pi}{4} d^2 f_s = \cdot 7854 \times 3^2 \times 5 = 35\cdot 35$ tons safe load; but there would be few cases in practice where pure shear stress would occur, although this method of calculation is often adopted. Taking the pin as a cylindrical cantilever, the ordinary calculation would be:—Bending moment = moment of resistance, $\frac{Pl}{2} = \frac{\pi}{32} d^3 f_t$, from which $P = \frac{0\cdot 196 d^3 f_t}{l} = \frac{0\cdot 196 \times 3^3 \times 6\cdot 5}{3} = 11\cdot 5$ tons safe load. But, although this is the method given by Professor Unwin in his "Machine Construction" for finding the safe load on crank pins, it appears that an allowance for shear is also requisite. This would make the working as follows, taking the same working stress in tension and shear:—

$$\frac{P}{\frac{\pi}{4} d^2} + \frac{P \frac{1}{2} l}{\frac{\pi}{32} d^3} = 6\cdot 5, \text{ or } \frac{P}{7\cdot 07} + \frac{P}{1\cdot 764} = 6\cdot 5,$$

whence $P = \frac{6\cdot 5 \times 7\cdot 07 \times 1\cdot 764}{1\cdot 764 + 7\cdot 07} = 9\cdot 17$ tons, or, say, 9 tons safe working load uniformly distributed.

HENRY ADAMS.

Professional Etiquette and Advertising.

W. T. writes: "I am about to open an office in a neighbouring town. Is it considered a breach of professional etiquette to advertise in a local paper to that effect, or would it be more correct to send round a circular to people of position notifying them of my intentions?"

You do not say what you are, but we presume you are an architect. There is no reason why you should not notify through the local paper that you have opened an office in the town, and also, if you wish, circularize possible clients, as suggested; but everything of course depends on the particular way in which you do this. No doubt a lot of rubbish about the dignity of the profession is talked at society meetings, while the very men who are then so zealous act in quite unprofessional manner in practice; nevertheless there is such a thing as etiquette, which every self-respecting architect will observe, and nothing in the nature of touting is admissible. Still, architects have to live and to move with the times, and if no work comes to them while they are sitting in their back offices with the utmost professional dignity they need to adopt some method of drawing attention to their existence. Exactly how this should be done rests for each person to decide for himself, in view of the particular circumstances in which he is placed.

Drain or Sewer.

LEYTON.—MATERIAL DIFFERENCE writes: "Referring to the answer to my query on p. 87 of your issue for February 15th, the 'town hall plan' referred to means the plan approved by the town hall authorities (*i.e.*, the then vestry) when the houses were being built and in accordance with which the drains were ordered to be laid. This house is one of several which discharge sewage into a common drain, the said common drain going under the house referred to."

The point was decided in the case of *Greater London Property Co.* v. *Foot* (1899, 1 Q.B. 972), in which it was held that a mere deviation in the course of a drain from the plan signed by the surveyor (there being no evidence that any houses other than those on the plan were drained by the combined operation) was not sufficient to convert it into a sewer.

Designs of Houses.

PADSTOW.—W. J. W. writes: "Is there a book published giving designs for different classes of houses?"

Innumerable designs for houses have been published in this Journal and in our contemporaries, which you can consult at any

good-sized public library—say Launceston in your case. Numerous books of such designs have also been published, as you will see by consulting our Book List (given in previous issues).

The Orders.

ROCHESTER.—H. V. writes: "Please recommend some books which give general rules for setting out the Greek and Roman Orders."

We recommend Spiers's "Orders of Architecture" (price 10s. 6d. post free from our offices).

Formulae for Wooden Posts.

ROCHESTER.—H. V. writes: "Are the following formulæ for determining the sizes of wood storey posts reliable, and what is the meaning of the various letters?—

Square posts, $5 = \frac{ad^4}{L^2}$.

Circular posts, $5 = \frac{ad^4}{1{\cdot}7L^2}$.

Rectangular posts, $5 = \frac{abt^3}{L^2}$."

These appear to be similar to Reuleaux's formulæ. They may be tested and the coefficient added by taking examples and working them by other methods, say square post 6ins. by 6ins., rectangular post 4ins. by 9ins., and a circular post 6¾ins. diameter, all 10ft. long and of the same sectional area, ends flat. By Table VII., "Notes on Building Construction," based upon experiments:—Square, $\frac{10 \times 12}{6} = 20$ diameters long; area, $6 \times 6 = 36$ sq. ins.; allowance, 115 tons per sq. ft.; breaking load $= \frac{36}{144} \times 115 = 28{\cdot}75$ tons. Rectangular, $\frac{10 \times 12}{4} = 30$ diameters long; area, $4 \times 9 = 36$ sq. ins.; allowance, 90 tons per sq. ft.; breaking load $= \frac{36}{144} \times 90 = 22{\cdot}5$ tons. Circular, $\frac{10 \times 12}{6{\cdot}75} = 17{\cdot}7$ diameters long; area, 36 sq. ins.; allowance (by interpolation), 116 tons per sq. ft.; breaking load $= \frac{36}{144} \times 116 = 29$ tons per sq. ft. Reuleaux's formula for approximate safe permanent load in tons on square fir posts is $50\frac{d^4}{l^2} = 50 \times \frac{6^4}{120^2} = 50 \times \frac{1296}{14400} = 4{\cdot}5$ tons, showing a factor of safety of $\frac{28{\cdot}75}{4{\cdot}5} = 6{\cdot}4$ on the previous calculation, practically identifying the given formula and fixing the coefficient. Applying this knowledge to the rectangular post, we have $\frac{50bt^3}{l^2} = \frac{50 \times 9 \times 4^3}{120^2} = 2$ tons, showing a factor of safety of $\frac{22{\cdot}5}{2} = 11{\cdot}25$. Applied to the circular post, $\frac{50d^4}{1{\cdot}7l^2} = \frac{50 \times 6{\cdot}75^4}{1{\cdot}7 \times 120^2} = 4{\cdot}24$ tons, showing a factor of safety of $\frac{29}{4{\cdot}24} = 6{\cdot}8$. It should be noted that a small *l* should be placed in the formulæ submitted, as the length must be taken in inches; the formulæ may then be pronounced satisfactory. HENRY ADAMS.

Ancient Lights.

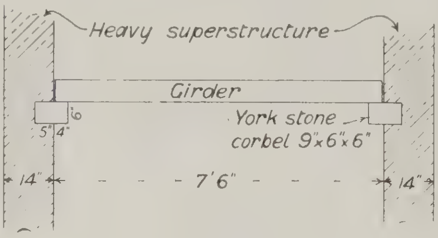
X. writes: "A window on a first floor overlooks an old roof. It is proposed to demolish the old building and reconstruct. The new building is to be finished with a lead flat about 12ins. above the existing ancient light. What are the limits to observe in setting back the flat so as not to interfere with the ancient light? Is it necessary to set back all around the window, or only directly in front?"

It will be necessary to set back to the angle of the existing old roof on one side and to an angle of 45 degs. on the other, otherwise there would be an undoubted obstruction of light. M.

Strength of Stone Corbel.

REIGATE.—C. E. S. writes: "How can I determine the safe carrying load of the corbels shown by the accompanying sketch?—the girder to rest on corbels, and not to be built into wall either end."

Taking the ultimate tensile strength of good York stone as 1,000 lbs. per sq. in, the girder as possibly bearing on outer end of corbel only, the factor of safety 5, then the safe carrying load of each corbel, so far as regards its own strength, will be:—Bending moment = moment of resistance, $wl = zc$, $wl = \frac{bd^2}{6} \times \frac{1000}{5}$, $\therefore w = \frac{bd^2}{l} \times 33\frac{1}{3} = \frac{6 \times 6^2}{4} \times 33\frac{1}{3} = 1{,}800$ lbs. But with 1,800 lbs. at outer end of corbel, the inner end will have a lifting tendency of $\frac{1800 \times 4}{5} = 1{,}440$ lbs. and the face of wall will have to support a load of $1800 + 1440 = 3240$ lbs., or $\frac{3240}{6} = 540$ lbs. per inch run on a line. Taking now the load bearing on the centre of the projection, half the length in wall resisting downward force, and half resisting upward force, we have $\frac{1800 \times 2}{3{\cdot}75} = 960$ lbs. lifting tendency at back, and $1{,}800 + 960 = 2{,}760$ lbs. downward thrust upon a surface of $6 \times 2{\cdot}5 = 15$ sq. ins., $\frac{2760 \times 144}{15 \times 2240} = 11{\cdot}83$ tons per sq. ft.; while the maximum safe load on stock brickwork in mortar is 4 tons per ft. super. The actual stresses will depend upon the exact conditions of the workmanship and material, but it is evident that it will be necessary to increase both the width of corbel and the distance built into wall.



HENRY ADAMS.

Colour-wash on Cement Facing.

KENSINGTON.—W. H. writes: "What is the cause of a cement colour-wash on the external cement face of a house going to powder and coming off? I colour-washed the outside walls of the house in 1900, and again in 1903, and each time the wash has gone to powder and can with the greatest ease be brushed off with the finger."

The colour has perished the cement, and probably an additional cause was the wall not being wetted before application. The work should be cement-washed first, and a colour wash of distemper or water paint put thereon.

Housing.

COVENTRY.—JUNIOR writes: "Can you inform me if any paper has been read on the housing of the working classes, and if so, where can I get a copy?"

A number of papers on the subject have been published in our columns and can be found by consulting back volumes. We may specially mention the papers by Messrs. Louis Ambler and Owen Fleming read before the Architectural Association, and reported in our issue for May 14th, 1902; particulars, with plans and illustrations, of "Some Housing experiments in Glasgow," published in our issue for October 9th, 1901; and a review of the L.C.C. book on "London Housing, 1855-1900," with several plans, in our issue for February 13th, 1901. Cranfield's "Housing of the Working Classes" is a good recent book on the subject.

Books on Brickmaking.

PORTSMOUTH.—X. writes: "Please give names and prices of books dealing with brick manufacture, kilns, &c."

See our No. 1 Book List.

A Fire-resisting Tool Chest.

CRICK.—W. H. C. writes: "Would it be possible to make a joiner's tool chest fireproof by nailing 'Uralite' on the outside? Of course there would be a joint where the lid is hinged."

Yes—the idea is a good one. We suggest nailing sheets of "Uralite" $\frac{3}{16}$in. thick in the positions you propose.

Clerk of Works.

BIRMINGHAM.—STUDENT writes: "I have had seven years' experience in the architectural profession. I am very well up in all branches and have gained several successes in examinations, competitions, &c. Would it be possible, and advangeous, for me to take up the duties of clerk of works for a period of perhaps twelve months? What subjects would I need to study and what are the general duties of clerks of works?"

Yes, it would be sure to do you much good. You should read books on the duties of clerks of works, the conduct of building works, the subject of specifications, and it would be well if you passed the examination for clerks of works held by the Carpenters' Company, whose address is Carpenters' Hall, London Wall, E.C. A book on the duties of clerks of works was written by the late Mr. Leaning. Papers have also been read on the subject before various societies, as you will find by referring to our volumes.

Cottage Baths.

LONDON.—M. A. writes: "Which is the simplest method of providing a bath in a six-roomed labourer's cottage? Is tinned iron the most suitable cheap material? Is a bath less than 5ft. long worth providing? Does not sinking it below the floor mean expense in excavation and great difficulty in emptying and repairing? Are upright cabinets satisfactory? Should the bath be in the scullery in preference to the living-room?"

A painted cast-iron bath is the cheapest, and quite satisfactory. It is not advisable to place it beneath the floor, and it should not be in a living-room. Upright bath cabinets are expensive, and for that reason must be eliminated, though they are convenient. It is sometimes possible to put the bath in such a position that a door can be folded back to enclose it and shield it from view, but perhaps the handiest and most economical position is to place it under the sink and draining-board on hinges to pull out. A 5ft. bath is sufficient.

Miss Ethel Charles, A.R.I.B.A., who won the Institute Essay Medal this year, served her articles for three years with Messrs. Ernest George & Peto, afterwards working for some months in the office of Mr. Walter Cave. She passed the R.I.B.A. intermediate and final examinations, and in 1898 was duly elected an Associate, being the first woman to attain this distinction. Her proficiency in modern languages, combined with her professional knowledge, has made her in request as a reviewer of modern Italian and German books on architecture.

Coming Events.

Wednesday, March 8.

ROYAL SANITARY INSTITUTE — Inspection and Demonstration at Islington, by Mr. James R. Leggatt, at 2 p.m.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Mr. Hippolyte J. Blanc, R.S.A., on "The Arts of the Monastery," at 8 p.m.

Thursday, March 9.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY. —Mr. E. C. Skill on "Architectural Photography," at 6.30 p.m.

CARPENTERS' COMPANY.—Dr. J. Willis Clark on "The Origin and Development of the Collegiate Plan at Oxford and Cambridge," at 8 p.m.

ARCHITECTS' BENEVOLENT SOCIETY. — Annual General Meeting, R.I.B.A., 9, Conduit Street, W., at 5 p.m.

MANCHESTER SOCIETY OF ARCHITECTS.—Exhibition and Discussion of Students' Drawings, at 6.45 p.m.

Friday, March 10.

ARCHITECTURAL ASSOCIATION.—Mr. H. V. Lanchester, A.R.I.B.A., on "Law Courts," at 7.30 p.m.

INSTITUTION OF CIVIL ENGINEERS (Students' Meeting).—Mr. F. G. Helsby on "The Purification of Sewage," and Mr. F. O. Kirby on "The Purification of Sewage by Hydrolysis and Oxidation," at 8 p.m.

GLASGOW TECHNICAL COLLEGE ARCHITECTURAL CRAFTSMEN'S SOCIETY.—Mr. J. S. Boyd on "The Construction of a Stone Dome for a Public Building," at 8 p.m.

UNIVERSITY COLLEGE.—Mr. D. S. MacColl on "Madox Brown and the Pre-Raphaelites," at 4.30 p.m.

Saturday, March 11.

ROYAL SANITARY INSTITUTE. — Inspection and Demonstration at Tottenham disinfecting station and dust destructor, by Mr. J. F. Butler-Hogan, at 3 p.m.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Visits to Midlothian county council buildings and new "Scotsman" office buildings.

JUNIOR INSTITUTION OF ENGINEERS.—Visit to the Ritz Hotel, Piccadilly, at 3 p.m.

ARCHITECTURAL ASSOCIATION. — Fourth Spring Visit to University College Hospital extension, at 2.30 p.m.

Monday, March 13.

BRISTOL SOCIETY OF ARCHITECTS. — Mr. D. M. Nesbit, M.I.M.E., on "Heating and Ventilation," at 8 p.m.

SURVEYORS' INSTITUTION. — Mr. E. Morton on "Surveyors' Reports and Certificates," at 8 p.m.

Tuesday, March 14.

CARDIFF, SOUTH WALES AND MONMOUTHSHIRE ARCHITECTS' SOCIETY.—Mr. Herbert W. Wills, A.R.I.B.A., on "The Architectural Planning of Public Buildings," at 8 p.m.

ARCHITECTURAL ASSOCIATION OF IRELAND.—Mr. W. S. Hayes on "Some House of Lords' Decisions on Building Contracts," at 8 p.m.

Wednesday, March 15.

ROYAL SANITARY INSTITUTE. — Inspection and Demonstration at L.C.C. Municipal Lodging-House, Carrington House, Deptford, S.E., at 3 p.m.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Mr. W. Beattie Brown, jr., on "Spain," at 8 p.m.

ARCHITECTURAL ASSOCIATION (Discussion Section). —Mr. Alan E. Munby on "An Information Bureau on the Products of the Building Trade Industries," at 7.30 p.m.

SOCIETY OF ARTS.—Mr. E. H. Hankin on "Methods of Design in Mahomedan Art," at 8 p.m.

CONTRACTORS' STEAM MOTOR WAGON MADE BY THE ST. PANCRAS IRONWORK CO. LTD.

Trade and Craft.

Heavy Motor Traction.

Motor traction is making steady progress in the building and engineering trades. The motor wagon and motor lorry offer many advantages, particularly in respect of taking heavy loads and in economy of working. Among the applications to which a motor wagon can be put in these industries we may mention the transport of building stone and road materials, bricks, iron and steel work, timber, excavated material, &c. Though the motor trade is prospering, it is as nothing to the boom that will be witnessed within the next few years in the replacement of the multitude of horse carts and vans. Wisely recognising this, the St. Pancras Ironwork Co., Ltd., have recently taken up this branch of engineering in addition to their work in iron fireproof staircases, stable fittings, pavement lights, &c., for which they have a very wide reputation. It may be objected by contractors that in the cartage of excavated material motor wagons would not be able to ascend steep runways, or would sink in the soft ground, but with wide wheels both these difficulties are overcome, and motor wagons have been proved to be even superior to horses for the work. In this connection, by the way, the St. Pancras steam wagon possesses the advantage of exposing no parts of the mechanism to serious damage in the event of its sinking into bad ground, in which particular some of the other well-known types are deficient. The St. Pancras motor wagon is of standardized design and takes full advantage of the Local Government Board regulations. It is steam driven, petrol being advantageous for light cars only. Designed to carry 5 to 6 tons, it will carry and trail a total load of from 8 to 9 tons, according to the gradients to be encountered. This may be taken as the maximum possible load which may be efficiently handled without transgressing the regulations. In this type of motor wagon the machinery is simple and all complication is avoided; the design, materials and workmanship are such that the above loads can be dealt with day in and day out without incurring excessive depreciation and expensive repairs. From experience of the wagon in operation we can testify to its strength and efficiency and can highly commend its design. Every little detail has been thoroughly thought out. The older types of steam wagons suffered from a want of sufficient boiler power, due chiefly to the anxiety of the designers to reduce weight, the boiler usually being too small for the work required of it, with the result that there was a large bill for repairs and a want of sufficient power. In the St. Pancras wagon, the boiler, while not excessive in weight, has a large reserve of power, so that it is easy to maintain a good head of steam, even with inferior fuel. The engine, which is capable of developing 40 h.p., is compound and has cylinders respectively 4ins. by 7ins. bore and 6ins. stroke. The whole of the engine and gearing runs in a dust-proof and oil-tight casing, all the bearings being lubricated on the splash system. This is a great feature of the wagon, and by the unlocking of four bolts, the whole of the engine can be dropped on the ground for repairs, while by means of doors in the floor of the wagon it can be inspected without removing the engine. The wagon is chain-driven, the arrangement giving great flexibility to the drive, at the same time maintaining perfect alignment of the engine and gear shafts. The use of such chains for the drive causes fewer parts to be exposed to dust and dirt and subject to inefficient lubrication, and is superior to gear transmission. If a flying stone got in the cogs and broke them, an ordinary wagon would be put out of action, whereas if one chain broke, a wagon could be driven home with the other. The advantage of a chain gear is also very marked when a special type of wagon is needed, such as one with a very low float body for taking heavy stones, ironwork, safes, &c. This the company are able to do by cranking the back axle, which is of course impossible if it is a live one. A few people, however, prefer a complete gear transmission, and the St. Pancras Co. have so arranged their system that they are able to fit gears instead of chains and sprockets with the least possible deviation from their standard design. Two speeds are provided—six and three miles per hour. The steering gear is on the Ackermann system. The arrangement of operating handles and levers has been studied in order to give the driver complete control of the vehicle without moving from the steering wheel. With regard to the frame, here a very great improvement on ordinary types has been effected, and the St. Pancras arrangement has been patented by the company. The fore-carriage is transversely pivoted, thus obviating the distortion and loosening of the rivets when traversing uneven ground which occurs in other types of frames where the straining is great, as can easily be understood when one considers the heavy weight carried. The frame is of strong channel section steel, suitably braced and tied. Any type of carrying body can be fitted to order to the standard chassis. From the average of several examples taken from actual practice, the cost of operating the St. Pancras wagon under average conditions of loading works out at $1\frac{1}{2}$d. per ton mile. Both in the matter of first cost and expense of working this wagon triumphantly challenges comparison with older wagons, while it is stronger in construction and more powerful. We shall deal with its construction more fully on another occasion. The address of the company is 171, St. Pancras Road, London, N.W.

B. T. BATSFORD, Publisher, 94, High Holborn, London.

Contracts Open.

METROPOLITAN BOROUGH OF FULHAM.
NORTH BRANCH LIBRARY.

The Council of the Borough of Fulham invite TENDERS for the ERECTION of a BRANCH LIBRARY in Lillie Road.

The drawings and specification can be seen at the office of the Borough Engineer and Surveyor, Mr. FRANCIS WOOD, A.M.I.C.E., F.G.S., Town Hall, Fulham, S.W. Quantities will be supplied to each person tendering on the deposit of three guineas, which will be returned on the receipt of a bonâ-fide Tender.

The Contractor will be required to sign a declaration that he pays the Trade Union rate of wages, and observes the hours of labour recognised in the London district as applying to the several trades employed on the works.

Sealed Tenders endorsed "North Branch Library" are to be delivered to my office before 7 o clock p.m., on Wednesday, the 29th MARCH, 1905. The lowest or any Tender will not necessarily be accepted.

R. M. PRESCOTT,
Town Clerk.
Town Hall, Fulham.

COUNTY COUNCIL of MIDDLESEX.

TO BUILDERS AND CONTRACTORS.

MAGISTRATES' COURTS, ENFIELD.

The Finance Committee invite TENDERS for the ERECTION of CARETAKER'S QUARTERS on a site adjoining the above.

MAGISTRATES' COURTS, WILLESDEN.

The Finance Committee also invite TENDERS for the ERECTION of CARETAKER'S QUARTERS on a site adjoining these Courts.

Plans and specifications may be seen, and information obtained (in respect to each building), at my Offices on payment of two guineas, which will be returned on receipt of a bonâ-fide Tender.

Tenders, sealed and endorsed "Caretaker's Quarters," to be delivered at the Offices of Sir RICHARD NICHOLSON, Middlesex Guildhall, Westminster, S.W., on or before Monday, MARCH 13th, 1905.

The County Council will not necessarily accept the lowest or any Tender.

H. T. WAKELAM,
County Architect.
Middlesex Guildhall,
Westminster, S.W.
February 21st, 1905.

NOTICE TO OUR SUBSCRIBERS.

THE INDEX OF "THE BUILDERS' JOURNAL."

The Title Pages and Index to any volume of "THE BUILDERS' JOURNAL" may be had free, upon application being made to the Office, Great New Street, enclosing 1d. stamp to cover postage of same.

VOLUMES I. to XIX. of
THE BUILDERS' JOURNAL.
Handsomely bound in cloth gilt, 7/- each.
Binding Cases for any of the above Volumes can now be obtained, price **1/9** each.

Privileges open to all Regular Readers of the "Builders' Journal."

I.—Free Monthly Advertisements.

1. A Free Advertisement of 12 words in the Wanted or Miscellaneous Advertisement Columns, in one issue of the BUILDERS' JOURNAL during each calendar month will be given to any regular reader.

2. The charge of one penny will be made for each additional word.

3. Advertiser's Name and Address or Box Number must be counted, but will in no case be reckoned as more than five words.

4. All advertisements must be accompanied by the correct remittance, and should a receipt be required a stamped addressed envelope must be enclosed.

5. The Proprietors reserve to themselves the right of refusing any advertisement.

II.—Free Answers to Enquiries.

1. The services of a large staff of experts are at the disposal of all regular readers who require information on architectural, constructional or legal matters.

2. Questions should in all cases be addressed to the Editor, and be written on one side of the paper only.

3. Correspondents are particularly requested to be as brief as possible.

4. The querist's name and address must always be given, not necessarily for publication

Note.—Owing to the large number of enquiries we receive weekly, we are compelled to restrict the advantages of this department to Regular Readers.

III.—Free Accident Insurance of £500.

1. Every regular reader of the BUILDERS' JOURNAL is entitled to the benefit of this Insurance.

2. A Pamphlet giving full details of this and other Insurance schemes inaugurated by the BUILDERS' JOURNAL for the benefit of its readers, and guaranteed by "The Ocean Accident Corporation, Limited," will be sent on application.

What is a Regular Reader?

We have employed the term "Regular Reader" throughout these announcements as the description "subscriber" is often understood to mean one who subscribes direct to the publishing office.

We mean by a Regular Reader anyone who has placed an order with us or any newsagent or bookstall for the BUILDERS' JOURNAL for one year.

Those readers who order the BUILDERS' JOURNAL through their local newsagent or bookstall should send us the newsagent's receipt. Their names will then be placed on our subscribers' list, and they will be entitled to all the advantages set out above.

5 O'CLOCK P.M. MONDAY IS THE LATEST TIME FOR RECEIVING "WANT" ADVERTISEMENTS.
OFFICE: 6, GREAT NEW STREET, FETTER LANE, E.C.

THE STANDARD TEXT-BOOKS ON THE PRINCIPLES AND METHODS OF MODERN CONSTRUCTION.
PRACTICAL—UP-TO-DATE—COPIOUSLY ILLUSTRATED.

NOW READY. 6th Edition, revised and greatly enlarged.
400 pages with **1,000** Illustrations (fully dimensioned). Crown 8vo, cloth, price **3/-**

BUILDING CONSTRUCTION.
FIRST STAGE.
By Charles F. Mitchell.
Architect: Lecturer on Architecture and Construction at the Polytechnic Institute, Regent Street, London.
Assisted by **George A. Mitchell.**

The Builders' Journal says :—"It is undoubtedly the best work a student can obtain on elementary construction The illustrations now number more than a thousand, and are most clearly drawn The price is wonderfully low"

The Builder says :—"The book is a model of clearness and compression—well written and admirably illustrated—and ought to be in the hands of every student of building construction."

NOW READY. 4th Edition, revised and greatly enlarged.
700 pages with **660** Illustrations (fully dimensioned). Crown 8vo, cloth, price **5/6.**

BUILDING CONSTRUCTION.
ADVANCED AND HONOURS COURSES.
By Charles F. Mitchell.
Assisted by **George A. Mitchell.**

The BUILDER says :—"Mr. Mitchell's two books form unquestionably the best guide which any student can obtain at the present moment. In fact, so far as it is possible for anyone to compile a satisfactory treatise on building construction, Mr. Mitchell has performed the task as well as it can be performed. . . . The two parts together should be in the hands of every architect's pupil, and will be found excellent value for their small price.

The Building World says :—"For clearness, thoroughness, cheapness, and general adaptability to the needs of the student, this text-book is acknowledged to be second to none."

The Surveyor says :—"It would be impossible to find a clearer or better exposition of building work in any of its branches, theoretical or practical."

B. T. BATSFORD, 94, High Holborn, London.

Just Published.

REVISED AND ENLARGED EDITIONS OF PARTS I., II., & III. OF RIVINGTON'S COURSE OF BUILDING CONSTRUCTION.

NOTES ON BUILDING CONSTRUCTION,

Arranged to meet the requirements of the Syllabus of the Board of Education, South Kensington.

PART I.—New Edition, Revised and Enlarged (1904), with 695 Illustrations. **10s. 6d. net.**
PART II.—New Edition, Revised and Enlarged (1904), with 456 Illustrations. **10s. 6d. net.**
PART III.—Materials. Sixth Edition, Revised (1904), with 188 Illustrations. **18s. net.**
PART IV.—Calculations for Building Structures. Fifth Edition, Revised (1901), Reissue with new Prefatory Matter (1903), with 597 Illustrations. **13s. net.**

"The work remains, as we said it would become, when the first edition of the first part was published in 1875, the best text-book on the subject extant. For nearly thirty years we have used it, and never found it wanting. It was, and is, the one text-book which the student of building construction cannot possibly do without."—*English Mechanic.*

"For students preparing for any of the professional examinations, these volumes are of great value, as they form a compendium of the science of construction applied to building, and for general reference the architect will find them of service."—*Building News.*

"Each volume is furnished with appendix and index—the latter got up on a liberal scale and apparently with excellent results. From the foregoing, it will be seen that the work is comprehensive in character; by its republication in enlarged and revised form, the proprietors have done a wise and a useful thing, and there can be no doubt they will in due time come in for well-merited reward."—*Building Industries.*

LONGMANS, GREEN & Co., 39, Paternoster Row, London.

HALL'S SANITARY WASHABLE DISTEMPER

In 70 Different Colours which can be varied by combination

It only requires water added to be ready for use, and is applied with a Whitewash Brush.

On Plaster, Wood-work, Brick-work, or any building material whatsoever, there is no wall covering so successful and so easily applied as Hall's Sanitary Washable Distemper. It is made in two qualities, for outside and inside work respectively, and is obtainable in 70 distinct colours, which include rich dark shades as well as light tints. Its covering power is double that of pure white lead paint.

Sample, Shadecard, and full particulars will be sent on application to the sole manufacturers,

SISSONS BROTHERS & CO., LTD., HULL.
London Office—199^{b}, BORO' HIGH STREET, S.E.

***CAUTION**—The Name is on every package of Hall's Distemper.*
Avoid inferior imitations which do not possess the same qualities.

TENDERS—*cont. from p.* xviii.

London, N.—For sanitary and drainage improvements at Dawbeney Road School, Hackney, for the London County Council:

A. E. Symes, Stratford	£2,675
A. Porter, Tottenham	2,559
McCormick & Son, Essex Road	2,519
Durbin & Katesmark, 11, Blandford Street	2,463
J. Willmott & Sons, Hitchin	2,416
Lathey Brothers, Battersea Park	2,405
G. Munday & Sons, Trinity Square	2,352
G. S. S. Williams & Son, Barnsbury	2,313
E. Lawrance & Sons, City Road	2,251
J. Peattie, Baker Street	2,217
Stevens Brothers, Seven Sisters Road	2,207
L. H. & R. Roberts, Islington	2,101
F. Bull,* 31, Old Hill Street, Upper Clapton	2,075

* Recommended for acceptance.
[Architect's estimate £2,282.]

Manchester.—For the erection of a bakery in Lower Broughton Road, for Mr. G. Spink. Mr. Arthur V. Roberts, architect, Great Cheetham Street West, Manchester, N.W. :—

E. J. Coupe & Sons	£393	10	0
D. Portington	385	17	0
W. D. Scott	362	0	0

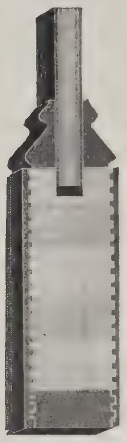
J. W. JACKSON & Co., painters and decorators, Lincoln. R.O. Feb. 20th. P.E., Sessions House, Lincoln, March 30th, at 3.

A. PERRY, monumental mason, Fulham. R.O. Feb. 23rd. First meeting, London Bankruptcy Court, March 10th, at 12. P.E., same, March 31st.

W. YOUNG, builder and contractor, Twyford. Gross liabilities £3,502; £2,778 expected to rank for dividend; assets £498; deficiency £2,279.

THE GILMOUR DOOR·Co LTD
Factories Trenton Canada
53 BERNERS STREET
LONDON



All the material used in the Framing of these Doors is put together as shown here.

The Interior "Core" is made in strips of selected pine with the grain reversed, and dried with 200 degrees of heat.

The Exterior Hardwood Facing is welded to the Core by means of immense pressure, making in effect one solid piece.

RICHLY CARVED DOORS carefully reproduced from old models can be made in any hardwood, possessing all the elegance and richness of figure and colour found in the antique examples.

ARCHITECTS are invited to inspect the specimen doors on exhibition to satisfy themselves as to the construction, quality and artistic merit. Sample doors can be seen at the Showrooms of the various agents, or at 53, Berners Street, London, W.

A GUARANTEE. The Gilmour Door Co., Ltd., will give a guarantee with all their doors that they will not warp, twist, split, shrink or crack. They are absolutely reliable.

COST. A well-made Hardwood Door can be obtained at prices varying from 35s. to £10.

CATALOGUE. A book of designs, prices, &c., will be sent on application to "Dept. B," 53, Berners Street, London.

HARDWOOD

THE BUILDERS' JOURNAL AND ARCHITECTURAL RECORD.

March 15, 1905. Vol. 21, No. 527. 6, Great New Street, Fetter Lane, E.C.

Summary.

Dalmeny Church is one of the most beautiful examples of Norman architecture remaining in Scotland, but it is a great pity that the interior is marred by incongruous modern fittings. (Page 134.)

A quay 1¼ miles long is to be constructed about six miles above Gravesend at a cost of £1,000,000. (Page 145.)

A deadlock has occurred between the master and operative painters at Aberdeen in regard to the date of signing by-laws and the employment of labourers on painting, glazing and papering work. (Page 145.)

Speaking at Penryn last week Mr. Douglas Hall said that on every £1,000 granite contract £666 went in wages, and for that reason he maintained there should be a heavy protective duty on granite. (Page 145.)

The German industrial association has petitioned the Government to allow steel-framed buildings to be erected in Berlin of a greater height than the present limit of 72·18ft. The Government, however, flatly refuse to grant such a request, for reasons of public health, water-supply and fire protection. (Page 137.)

Sir Aston Webb makes a special appeal for the Architects' Benevolent Society. Of all the architects practising in the United Kingdom, not more than 5 per. cent. contribute to it. (Page 138.)

Mr. H. V. Lanchester read a paper on law courts before the Architectural Association last Friday, in the course of which he said that the witness-box should not be less than 10ft. nor more than 12ft. from the judge, and within 12ft or 14ft. of the examining barrister and the jury. If much further than this the witness's replies might not carry, and the facial expression, which was sometimes important, might escape observation. At the new Cardiff law courts the witness-box had been placed on the jury side. (Page 140.)

In a case heard last week in the King's Bench Division the jury awarded £2,000 damages for injury done to a house in Highbury Crescent by subsidence due to the "tube" railway. (Page 137.)

In the course of a paper on sewage treatment which he read before last week's meeting of the Sheffield Society of Architects Mr. A. E. Turnell said a cultivation tank and bed could be built at very small cost, and sewage treated by this method might be turned on the land or into a stream without fear of further putrefaction or of causing a nuisance to adjoining estates. (Page 139.)

Reinforced Concrete. The most appropriate name by which we shall know the combination of metal and concrete in due proportion to best resist stresses has been often debated and seems to be troubling many persons. The French, who were first to elaborate this system of construction, called it "ciment armé," from which we get the term "armoured concrete," but as this suggests an external metal sheathing it is distinctly inappropriate. "Ferro-concrete" likewise seems hardly the word, because it would apply more nearly to a concrete made with a rust cement. In the United States the term "concrete steel" is often adopted, but steel is a kind of concrete from a metallurgical point of view, and this therefore seems unscientific. "Framed" and "trussed" concrete are two other words that have been suggested, but concrete cast in moulds or on centering is, as it were, framed; while beams and floors only are trussed and not columns. "Reinforced concrete" seems to be the best term. Although not altogether descriptive, it is wide and distinctive enough, we think, and is already generally accepted.

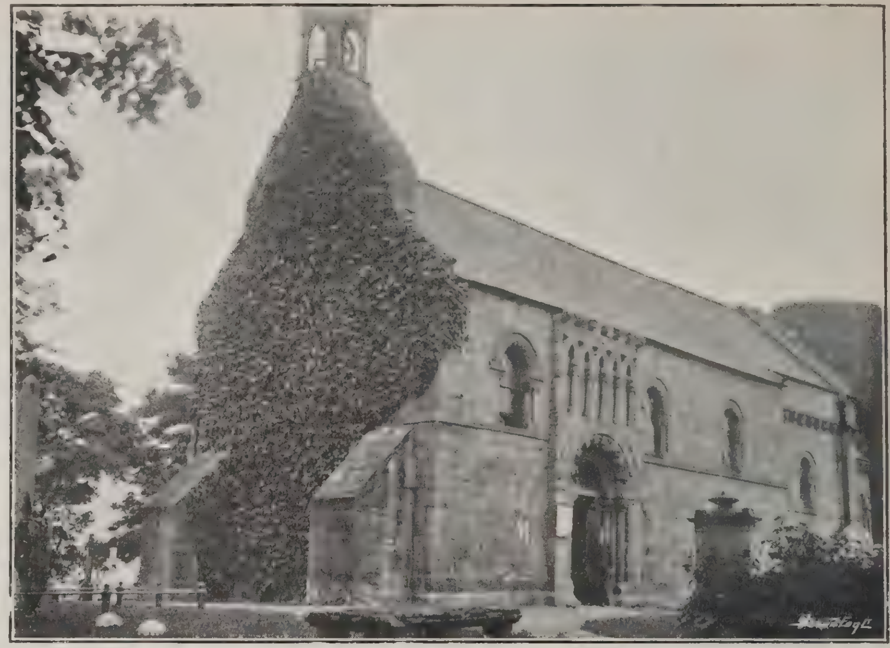
The Greatest Discovery in Egypt. WITHIN the last decade many wonderful discoveries have been made in Egypt, but they all pale in comparison with the tomb of Yua and Thua (parents of the famous Queen Teie) which has just been discovered by Mr. Theodore M. Davis in the valley of the Tombs of the Kings. The announcement of the discovery was made on Thursday last in the "Times," by whom it is characterized as far surpassing any that has ever been made in Egypt, and such that has not fallen to the lot of any explorer since Egypt was opened to European research. The tomb is about 30ft. long, 15ft. wide and 8ft. high, and remains exactly as it was in the 18th Dynasty (*circa* B.C. 2000). It has never been visited or plundered since that remote age, and it is still filled with the royal treasures—the untouched and richest spoil of ancient Egypt. Mummy cases encrusted with gold, huge alabaster vases of exquisite form, chairs and boxes brilliant with paint and gilding, even a pleasure chariot with its six-spoked wheels still covered by their wooden tires, were found lying piled one upon the other in bewildering profusion. It was some days before the band of explorers could even ascertain the full extent of the treasures which the tomb contained, and it will be some time yet before the work of thoroughly clearing out the tomb can be accomplished. Meanwhile it has revealed one striking fact—the ostentatious, not to say vulgar, display of wealth which distinguished Egyptian society in the later days of the 18th Dynasty, when Egypt was the California of the civilized world. There was nothing, however mean or insignificant, which was not literally plated with the gold of the desert mines.

A Valuable Addition to the British Museum. A MOST valuable addition to the architectural treasures of the British Museum has just been made—namely, the complete shaft of one of the columns at the entrance to the Treasury of Atreus at Mycenæ. If will soon be set up in position in the Archaic room, when all interested in Grecian architecture should not fail to take advantage of seeing for the first time this most complete as well as most highly-decorated example known of the Mycenæan column, with its downward taper outline, the immediate ancestor of the developed Greek order. The story of how it came into the hands of the Museum authorities is interesting. At the beginning of the nineteenth century it appears that the second Marquis of Sligo visited Greece and obtained permission to excavate there. Unfortunately there is no detailed record of his researches, but whatever finds he made seem for the most part to have been removed to the family estate of Westport, county Mayo, and it was while studying these last year that the Earl of Altamont, son of the present Marquis of Sligo, came to the conclusion that certain columns in the collection were of unusual importance. He made careful drawings and photographs of them, which were brought to the British Museum, and the probability that they were the missing decorations of the Treasury of Atreus was at once made evident. Lord Altamont soon afterwards paid a visit to Mycenæ for the express purpose of comparing his measurements with the traces left *in situ*, and the result leaves hardly any doubt that the surmise is correct. Thus, with the fragment found at Argos in 1812 by Baron Haller, the companion of Cockerell in the famous enterprise at Ægina, the erection of this shaft is made possible, while a complete restoration of the base, capital and abacus can be made from a combination of the scattered fragments in the museums at Berlin, Carlsruhe and elsewhere. The story of this shaft resembles that of the fragment of the Parthenon frieze discovered by the late Dr. Murray in an Essex garden, and furnishes another instance of the wonderful erudition of leading archæological authorities.

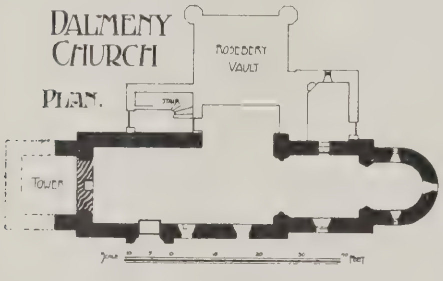
DALMENY CHURCH

By J. JEFFREY WADDELL.

ONE of the most beautiful examples of Norman architecture remaining in Scotland is the church of Dalmeny, situated near the residence of the Earl of Rosebery and within two miles of the south end of the Forth Bridge. It was probably erected about 1130 by Gospatric, the second earl, generally styled the brother of Dolphin, and was dedicated to St. Cuthbert. As is customary, it occupies a site close to the ancient mote or castle of the Norman landholder. It is built in the style which characterizes other remains of this period; several of the details of this church, indeed, suggest that its designer—whoever he may have been—must have been familiar with the work which at that time was being carried on at the great cathedral of Durham, from which the beautiful nave of Dunfermline Abbey (only a few miles from Dalmeny, on the north side of the Forth) was also modelled. Its plan consists of a vaulted choir with an eastern semicircular apse, which is also vaulted, and a nave measuring 42ft. 6ins. by 17ft. 8ins. Two deep buttresses project from the west gable of the nave; these have been shown recently by Mr. P. Macgregor Chalmers* to be part of the wall of a great western tower which must have been similar to that of the tenth-century church of St. Regulus at St. Andrews. The plan of Dalmeny church somewhat resembles that of St. Regulus, but Dalmeny, being the later, shows its date and development in the addition of a chancel between the nave and the apse. The base of the western tower of Dalmeny formed part of the interior of the church, with which it was connected by means of a large arch. Externally the tower must have added great dignity to the church and been a landmark for miles around. It must have been destroyed in pre-Reformation days, as there is no mention of it in later times. Buildings have been erected abutting on the north side of the church in more modern times which do not improve its appearance and have destroyed part of the north wall of the nave. They occupy the probable site of the sacristy. Galleries have also been added to the church, its interior has been lathed and plastered, the roof of the choir has been raised, a belfry has been erected over the west gable, and the modern fittings, as will be seen from the photograph of the interior, are entirely at variance with the plan and architectural arrangement of the building.



VIEW FROM SOUTH-WEST.



In spite, however, of these disfigurements, the original beauty of the Norman architect's ideals are still apparent in the work. He must have been a thorough artist, for he has made the most of everything, yet always stayed his hand at the proper place and allowed the plain ashlar stonework to tell its own tale and enhance and act as a foil to the decorated portions, in which respect his work might well serve as a model and corrective to our pretentious modern structures.

The windows are all single lights, beautifully proportioned and enriched with angle shafts having carved capitals and chevron ornament around the arches. The sills rest on a richly sculptured string-course, and the wall-heads of the church are decorated with a series of carved masks in the typical Norman fashion.

The doorway is very rich. Here the architect has concentrated his ornament where it would have most effect. Two shafts enrich the jamb; the outer one circular, the inner one octagonal. The semicircular tympanum has gone, but the arch with its two orders and hood-mould remain, and many of the sculptured carvings are still in a state of tolerable preservation. These elaborate designs and figures no doubt had a world of meaning for the people of that Norman time, though some of them are unintelligible to us now. The upper portion of this projecting doorway is decorated with a beautiful arcade of five divisions with interlacing arches and double columns having carved capitals, and surmounted by a cornice of large carved masks. The whole forms a most satisfactory piece of design.

The interior, though it is at present disfigured by the fittings, lath and plaster and galleries, is still very fine. The rich arch between the nave and choir is of three orders

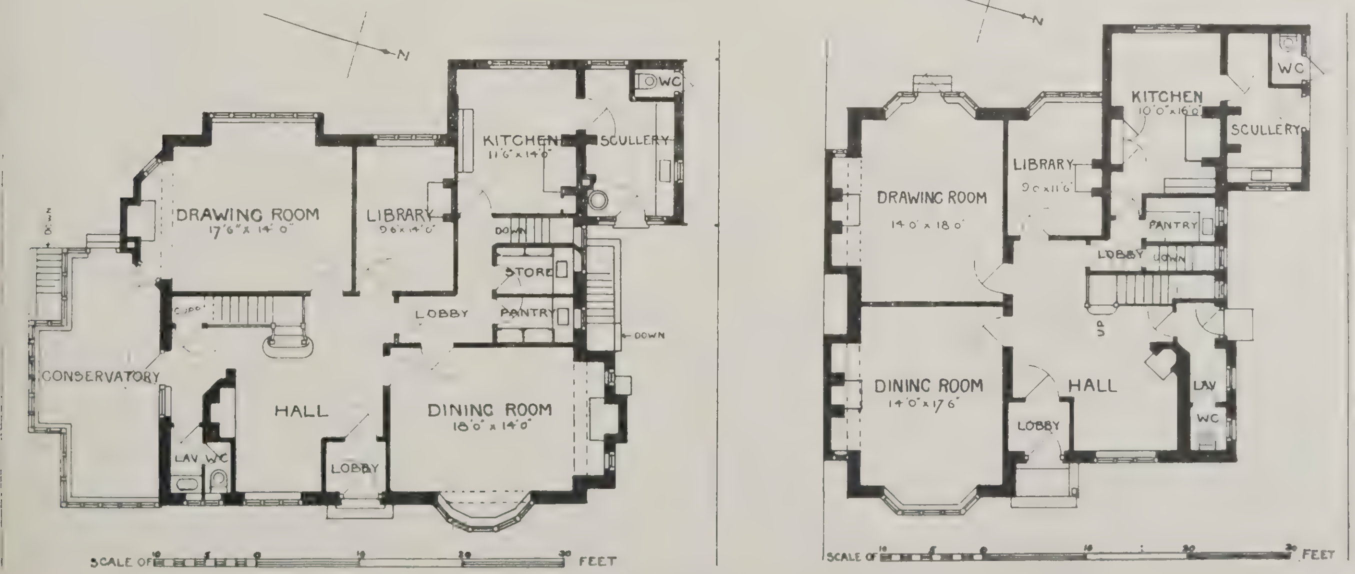
vith hood-mould, that between the chancel nd apse of two orders with hood-mould, and he groin ribs also enriched. Viewed from he west end of the nave, the lines converge hrough the choir to the apse. The interior s undoubtedly the finest of its style in Scotland, and it is a great pity that as it at present stands the original beauty is somevhat marred. Surely in the near future omeone may be found willing to restore his ancient fabric to its original glory, and so nsure its preservation for many years to ome. The work is much needed, and it is o be hoped that it will not be allowed to emain untouched.

The photographs illustrating this article re by Mr. W. Alexander.

OUR PLATES.

THE two houses, Nos. 5 and 9, Oakcroft Road S.E., are situated on the Knoll Estate, close to Blackheath. As will be seen from the plans, the chief feature of each ground floor is the hall arranged as a lounge. Both houses are faced with red bricks up to the first floor and tile-hung above. The staircases are of oak throughout. In the drawing-rooms the floors are laid with rock-maple and in other portions of the ground floors with oak. No. 9 has the hall panelled in oak and oak doors by Mr. John P. White, of Bedford. The conservatory was executed by Messrs. Duncan Tucker, of Tottenham. The cost of the houses worked out at about 10½d. per cubic foot. Messrs Kennard Brothers, of Lewisham, were the general contractors, and Mr. Leonard V. Hunt, F.R.I.B.A., was the architect.

The two pairs of cottages on the Ridgway Road, Farnham, were built about three years ago at a total cost of £1,210. They are of very pleasant aspect, but Mr. Harold Falkner, the architect, says they have not been approved by the working-class for whom they were erected, the British working-man's wife preferring a slate roof, plate-glass arrangement; so that some of them have been modified as indicated on the right-hand bedroom plan. The cottages are built of stock bricks, partly rough-cast, partly weather-boarded, with tile roofs.



NOS. 5 AND 9, OAKCROFT ROAD, BLACKHEATH, S.E.: GROUND-FLOOR PLANS.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Clerk of Works.

Kirkcaldy.—G. M. writes: "Where can I get particulars of the appointments for clerks of works in H.M. Office of Works?"

"The Civil Service Year-Book" and from the Civil Service Commissioners.

Books on Reinforced Concrete.

Sheffield.—E. A. C. writes: "Please give a list of books on reinforced concrete construction, containing all necessary formulæ, details, &c., for the design of such structures."

There are numerous books on the subject in French and German. As regards books in English, a good small one is "Notes on Steel Concrete Construction," by Major J. Winn, R.E. (W. & J. Mackay & Co., Ltd., 176, High Street, Chatham, price 2s. 6d. nett), but the best book is Marsh's "Reinforced Concrete," reviewed on p. 138 of this issue.

Diagrams of Arches and Vaults.

London.—X. writes: "One of the testimonies of study required for the R.I.B.A. final examination is a sheet containing diagrams of arches or groined vaults in brickwork or masonry. Would one of the sheets of Mitchell's 'Building Construction' answer the purpose, or should one go further afield and take examples from measured work?"

It is much the best to take examples from measured work, preferably measuring it for yourself; though a sheet of designed vaulting, such as that by Mr. Ormerod which was illustrated in The Builders' Journal for October 1st, 1902, is difficult to improve upon, whether finished in ink or in pencil and colour. G. A. T. M.

Sketching Prizes; American Architectural Papers.

Harrow.—A. R. B. writes: "(1) Are there any prizes for architectural sketches besides the 'Pugin'? (2) What paper corresponds to The Builders' Journal or The Builder in America, and where can it be procured?"

(1) None that we know of, except the prizes offered by the Architectural Association—including the Architectural Union Co.'s prize of £10—and those offered by the various architectural societies throughout the kingdom. (2) Particulars of the American building and architectural papers will be found on p. 33 of our issue for August 28th, 1901. There is no paper in America corresponding to The Builders' Journal. "The American Architect and Building News" has some good plates, well-written leaders, and oftentimes interesting papers read before American societies, but the news portion is very scanty. It is published weekly, price 50 cents—8 dols. (£2 1s. 4d.) a year post free to this country from 211, Tremont Street, Boston, Mass. "Architecture" (monthly, 30 cents, Forbes & Co., Ltd., 160, Fifth Avenue, New York) is very well produced, being full of excellent reproductions of photographs of current work. "The Architectural Review" (monthly, 50 cents, Bates & Guild Co., 42, Chauncy Street, Boston, Mass.) is similarly well printed, but gives photographs of old work as well. "The Brickbuilder" (monthly, 50 cents, Rogers & Manson, 85, Water Street, Boston, Mass.) is an excellent paper, giving constructional articles, working drawings and photographic reproductions of buildings in "materials of clay." In comparison with them all, however, the English architectural papers are far better value. Quite the best constructional paper of its class published in America is "The Engineering Record, Building Record and the Sanitary Engineer," weekly, price 10 cents, 114, Liberty Street, New York (obtainable in London at Hastings House, Norfolk Street, Strand). You are probably aware that all these publications can be consulted at the Patent Office, off Chancery Lane.

Colouring Cement Floors.

York.—Eboraceum writes: "Is there any preparation, other than Venetian red, for colouring cement floors, the material to be mixed with the other ingredients?"

No, there is no other pigment so suitable as red oxide of iron. Most metal oxide pigments are also suitable if permanent in themselves, though oxide of iron is the cheapest for yellow, brown or red.

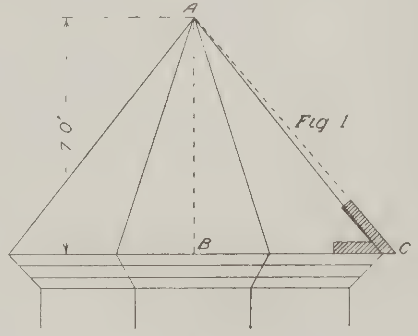
Competition for Garden City Cottages.

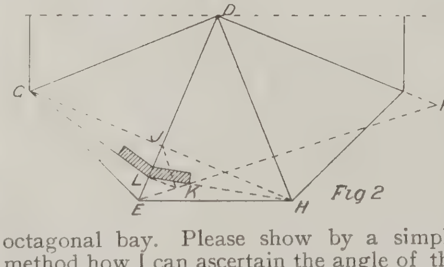
Lincoln.—S. P. D. writes: "Is the competition for cottages, &c., at Letchworth (the garden city) on a sound footing? I should like the opinion of an F.R.I.B.A."

We have not the conditions before us, and are therefore not in a position to express an opinion on the competition. However, the Competition Reform Society is supposed to look after these matters, and we always hear when a competition is regarded as unsatisfactory. In this case we have heard nothing, and therefore presume the conditions are satisfactory. Mr. W. V. Cooper, secretary of the Cheap Cottages Exhibition (347, Birkbeck Bank Chambers, Holborn, W.C.), states that the applications up to the present make the executive confident that the exhibition will be a success. Financial aid has been readily and generously given, and about £850 has been received, of which a large proportion has been allocated to the prize fund.

Bevels for Hip Tiles.

Herne Bay.—S. H. H. writes: "I send a rough sketch (re-drawn) of a roof over an octagonal bay. Please show by a simple method how I can ascertain the angle of the hips so as to have purpose-made hip tiles fixed for neat appearance."

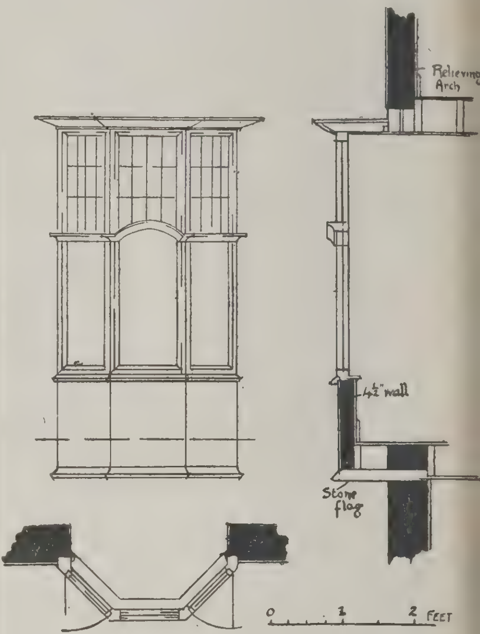




From the apex A in Fig. 1 drop a perpendicular to cut the line of eaves in B. From B take the horizontal distance BC = DE = length of hip rafter in plan (Fig. 2). Join CA, then BCA will be the true angle of the hip with the horizontal, or the pitch of the hip rafter. Now in Fig. 2 draw DF perpendicular to DE and equal to the height AB. In this instance it happens to coincide with another hip, but this is accidental. Join EF and GH, letting GH cut DE in J. From J drop a perpendicular on to EF, cutting it in point K, and from K drop a perpendicular on to DE, cutting it in point L. Join GL and HL. Then GLH will be the true angle between the roof planes meeting at DE, and therefore will give the backing to the hip rafters and the angle for the hip tiles. HENRY ADAMS.

Bay Windows to Houses.

A Northern Architect writes: "I have just finished a new building with a hanging wooden bay window, as per detail, and the local council has decided to summon me for this. The district surveyor says the plans were approved subject to the bay window being constructed of incombustible material. At the time the plans were passed I forwarded a letter stating that the bottom portion would be carried out in stone, with concrete over, but the window above would be constructed of wood and glass. The sanction of the council was conditional. The by-law in force is word for word the same as by-law No. 24 of the Local Government Model By-laws issued in 1877. I find this by-law is in use in a large number of other towns. At the same time, I know of no other town where wooden bay windows are not allowed. Is a window part of a structure of a wall, and if so, can local authorities pass plans conditionally, or must they either pass or reject them? I may say for your guidance that last year the same council permitted me to erect an exactly similar bay window, and took no action. They have also allowed a large amount of sham half-timber work to be fixed in front of gables, and windows to project beyond the outside line of the wall, and in a few instances have permitted wooden bay windows."



Though it is quite possible the urban district council are within the letter of their by-laws, there is little doubt that they are infringing the spirit in which it is intended that these should be administered. Personally I should defend such an action as they are now bringing against you, and think it very probable you will succeed. I regret that I have been unable to find a decided case upon the particular point to which you refer. F. S. I.

HIGH STEEL-FRAMED BUILDINGS IN BERLIN.

Government Refusal.

LAST year the Central Association of German Industrials addressed a memorial to the Government urging that the present building laws, which do not permit the construction in Berlin of dwellings or business buildings with a greater height than 22 meters (72·18ft.) from pavement to cornice, be so far relaxed as to allow steel-framed buildings of greater height to be erected, if not generally, at least in exceptional cases when good reason for such variation could be adduced.

The reasons for the proposed innovation as set forth in the memorial were that the rapid growth of Berlin in population and business interests required more room to be provided, particularly in the central districts, without increase of cost to tenants; that the restriction to a limit of four storeys compelled excessive lateral expansion that had already spread the city over an immense area, and thus lengthened the distance between the homes of many people and their work; and that experience in other countries had shown that high steel-framed buildings, when properly constructed, were safe, comfortable, uniformly better lighted and ventilated, and therefore more sanitary for dwellers and working people than those of ordinary height. Furthermore, it was urged that such a relaxation of building regulations would bring into use great quantities of structural steel and iron now largely produced in Germany, and for which an increased market would be highly appreciated by the steel and iron masters.

Thus plausibly stated, the appeal of the industrial association was submitted to the Ministers of Commerce, the Interior and Public Works, who, after due consideration, made a joint reply in which the petition was flatly refused for reasons which were stated at length but may be condensed as follows:—

(1) The Ministries are opposed to any system of buildings which will lead to an increase in the number of "renting barracks" (Miethscaserne), large buildings divided into a great number of small apartments or tenements, which are leased to families of working people, with the result that a great number of persons of both sexes and all ages are huddled together under conditions which are necessarily subversive of normal family life and prejudicial to public morals.

(2) Buildings so high as to be beyond the level of the present water supply could not be made clean and sanitary.

(3) Any important increase in height beyond the present limit would put the upper storeys of the buildings beyond the protection of the fire department as at present equipped and organized. Whatever might be the material interests involved, the Ministries held themselves bound to consider and protect not only the architectural unity and beauty of the city, but the health and the moral and physical safety of the people, all of which would, in their opinion, be compromised by the proposed innovation.

With this result the authors of the petition are by no means satisfied, and have replied that they had not proposed to carry buildings in Berlin to the excessive heights which are common in the United States, and that had the desired permission been granted it would have been provided by careful and competent engineering that all the requirements of fire protection, water supply and every sanitary necessity should be carefully and completely met. Moreover, in regard to resistance to conflagration, at Baltimore high steel-framed buildings, which offer least food for a fire, fully vindicated their superior safety and were left standing like monuments amid the wide waste of the ruins of four-and-five storey blocks built of stone and brick in the ordinary way.

Thus the discussion stands at present, and it does not appear likely that the Ministries, fortified as they are by considerations of municipal beauty and public health and safety, will recede from their position.

Law Cases.

Damage to House caused by "Tube" Railway.—In the King's Bench Division of the High Court of Justice on Friday the case of *Stockton and others* v. *The Great Northern and City Railway Co.* came before Mr. Justice Lawrance and a special jury. The case arose out of damage caused to 20, Highbury Crescent by the defendants' tube railway, which runs under a corner of the stables. The house was built in 1846, and an addition was made to it in 1865. The railway was made in 1900. Up to 1900 the claimants said there had been no appearance of movement in the house. When the tube was placed in position the defendants took away the lower part of the iron shell and substituted brick. Subsidence followed. At the end of 1901 cracks appeared in the house. In 1903 a cornice fell, and the billiard table had to be removed, as the floor was unequal. In January, 1904, the occupants were forced to leave the premises, as the back wall of the house was cracked from top to bottom and the house was unfit for habitation. The restoration of the house cost £1,111. Mr. G. F. Deacon, member of the Council of the Institution of Civil Engineers, attributed the movement to a displacement of the ground below, such as would occur in the construction of the tube, which could not have been put in without the clay being being left unsupported for a certain time. The settlement of the clay would extend to buildings at the side of the tube. The company had taken out the lower parts of the iron segments of the tube and substituted brickwork for them, which would create further subsidence. The pressure forcing the clay into the tube was 26 tons to the yard. Mr. Shiner, A.R.I.B.A., said he found the building out of plumb 1·87ins., and fallen away towards the tube. Counsel for the defendants said that in the strata in which this tunnel was driven there was no water, and no sand or pockets of soft material were met with. While the Greathead shield was in position, the tube was put in. Between the shield and the tube liquid cement was forced in under pressure. A segment of the tube was then taken out and had a foundation of grouting or liquid cement put in its place. It was said that the exposed end of the shield was without support and that movement could take place there. It had been found by experiment that that was not so. One thing was always to be remembered, subsidence only followed removal. If there was substituted for what was taken out an exact amount of substituted material, no subsidence would take place. The first thing seen in cases of subsidence was cracks in ill-built partition walls and piers. In this case the only portions of the premises over the tube had nothing wrong with them. The places that were affected were affected before the tube went there. Mr. Basil P. Everet, engineer in charge of the works during the construction of the line, said the tunnels were entirely in the London clay, and there was no water. They started grouting within two or three minutes of the shield going forward, and the cement would set within six minutes after the water was added. The cement was forced into the space by pneumatic pressure of 60 lbs. per sq. in. The cement in setting expanded into the crevices of the clay and compressed the clay. They found on inspection, when they opened up a part of the tube under Hornsey Fields, that there was 2ins. of grouting. The maximum surface without support at the face of the shield was 7ft. by 4ft. 6ins. The cutting edge of the shield, which was forced forward by pneumatic jacks, supported the clay. He had made tests, and there was no movement on the exposed surface of the clay. There was no difficulty in setting the brickwork at the bottom of the tube, and that showed there was no movement. Mr. Douglas Young, F.S.I., Mr. Gruning, F.R.I.B.A., Mr. Chatfeild Clarke, and Mr. Leslie Vigers, surveyors and architects, gave evidence for the defendants to prove that the house contained indications of old faults and cracks, and that the movement was due to the treacherous nature of the upper clay, and not to the tube, which was driven in the lower London clay. Other witnesses were called for the defendants to prove that the letting value of the houses in Highbury Crescent was diminishing. The jury returned a verdict for the claimants, with £2,000 damages.

Keystones.

A new Mortuary at Cardiff has been erected at a cost of £2,636 (site £1,500, building £1,136) in Trade Street, Penarth Road.

Aberdeen Society of Architects.—At the annual meeting held last week Mr. R. G. Wilson was elected president and Mr. John Rust vice-president.

Competition for Carnegie Library at Nelson.—Mr. G. H. Willoughby, F.R.I.B.A., of Manchester, has been appointed assessor in this competition, for which more than two hundred designs have been submitted.

Heraldic Glass.—At the recent annual meeting of the Exeter Diocesan Architectural and Archæological Society, Mr. F. Morris Drake read a paper on the heraldic glass in Ashton Church, which has been restored by him under the direction of Mr. C. E. Ponting, of Marlborough.

Manchester Infirmary Site.—The Royal Infirmary Special Committee of the Manchester Corporation has decided to prepare a report for presentation to the Council showing how the site of the infirmary could be utilized for the purposes of an art gallery and free reference library, and the City Architect has been instructed to prepare a block plan showing what portion of the site is available for building purposes.

A new Congregational Church is about to be erected at Seacombe, Cheshire, from designs by Messrs. Smith & Matley, architects, of 14, Ridgefield, Manchester. It will be faced with Ruabon bricks, with terracotta dressings, and the roofs will be covered with Westmorland green slates. The church will seat 650 and will have an octagonal tower with spire reaching to about 100ft. Messrs. Hughes & Stirling, of Bootle, are the contractors.

The Scottish Stonehenge.—Considerable interest is being taken in antiquarian circles in Scotland in a proposal to restore the Standing Stones of Stenness, often alluded to as the "Scottish Stonehenge." Mr. Cathcart Wason, M.P., suggests that if the proprietor, Colonel Balfour, were approached by the Society for the Preservation of Ancient Monuments he would afford every assistance in setting up the stones which have fallen and in making firm those which are likely to fall.

Northern Architectural Association.—The annual general meeting was held last week, when Mr. J. T. Cackett was elected president for the ensuing year and Mr. G. T. Brown vice-president. The annual report of the council stated the membership to be 221, which, excepting Manchester, was greater than that of any other allied society of the R.I.B.A. Finances were satisfactory, there being a balance of £129 to the good. Mr. A. W. S. Cross and Mr. G. Hubbard read papers on "Registration."

Preston Schools Competition.—Mr. F. W. Catterall has been appointed assessor in the competition for new schools at Preston, for which fifty-five sets of designs have been submitted.

An International Exhibition at Liege is to be held from April to October this year under the patronage of the Belgian Government. An International Housing Congress will be held in connection with it, and prizes are to be offered for a special competition in regard to the construction of workmen's dwellings, to be used as actual dwelling-houses after the exhibition has closed. The international committee for the organization of the congress is represented in this country by Mr. Henry R. Aldridge, 432, West Strand, W.C.

The Marine Drive at Scarborough, now being constructed around the foot of Castle Hill to connect the drives skirting the north and south bays, is proving a much more costly and difficult undertaking than was first anticipated by the Corporation, whose borrowing powers amount to £82,700. On Thursday last a Local Government Board enquiry was held, when an application was made to increase the borrowing powers by £25,000. The work was to have been finished in two years, but it has already occupied eight years, though it is now approaching completion.

A new Central Fire-brigade Station for Dublin is being built on a site at the corner of Great Brunswick Street and Tara Street, from designs by Mr. C. J. MacCarthy, the city architect. The corporation have entered into a contract for £17,000 with Mr. J. Donovan for the erection of the building, but the total cost is estimated at £25,000. Irish materials will be used as far as possible. The lower portion of the building, as well as the cornice and balustrade, will be of Irish limestone, and the walls of county Dublin bricks, faced externally with red bricks from Mr. Plunkett's works at Portmarnock. The roofs will be covered with Killaloe slates. Work on the foundations is now in progress, and the building will give employment to a large number of men for the next eighteen months or two years.

Architects' Benevolent Society.—At the fifty-fifth annual meeting held on Friday in the rooms of the Royal Institute of British Architects, Sir Aston Webb, R.A., made a special appeal for subscriptions, stating that not more than 5 per cent. of the architects practising in the United Kingdom contributed to the Society. Last year £950 was distributed among seventy-seven applicants for relief, and at the end of the year the accounts showed a deficit of £47. He feared that the benevolent work of the Society would be crippled this year unless there were a considerable addition to the number of annual subscribers. He had the pleasure to announce that Mr. William Glover, a past-president of the Northern Architectural Association, had that day presented the Society with £300, and further contributions of £25 each had been received from Mr. T. E. Collcutt, Mr. Edwin T. Hall and Mr. William Woodward, and to this list Sir Aston added his own name. As the majority of cases relieved by the Society come from the provinces, the Council note with much satisfaction that an appeal made in recent years to the allied societies has met with a sympathetic response. Last year the Leeds and Yorkshire Architectural Society (through their president, Mr. Bertram Bulmer) gave a donation of £10 10s. and added their name to the list of annual subscribers. To fill vacancies on the Council rendered vacant by the retirement of members in rotation, the following have been elected:—Col. Robert W. Edis, Mr. H. L. Florence, Mr. G. Bertram Bulmer, Mr. F. W. Hunt and Mr. Walter Spiers.

Views and Reviews.

Gas and Oil Engines.

As a cheap elementary book on gas and oil engines this is excellent. It is essentially practical in treatment and is illustrated by a number of diagrams clearly drawn and of a good size. There is, too, a very readable introductory chapter briefly tracing the development of the gas engine from its inception in the seventeenth century to the culminating Otto cycle. The author has aimed at furnishing just that information which is most needed by the user and the amateur builder of small power engines, and in place of a mere list of common engine troubles and their remedies he has given a full and clear explanation of the fundamental principles and essentials of good running. The contents of the book may be judged from the chapter headings, which are as follows:—The component parts of an engine; how a gas engine works; ignition devices; magneto ignition; governing; cams and valve settings; oil engines.

"Gas and Oil Engines simply explained," by Walter C. Runciman. London: Percival Marshall & Co., 26 29, Poppin's Court, Fleet Street, price 6d. nett.

A Sketch-Book.

We have received from the Manchester Society of Architects Parts I. and II. of their sketch-book, containing a number of lithographic reproductions of measured drawings and a few sketches. Mr. J. Harold Gibbons is the author of all the illustrations in Part I., these being of the principal drawings and sketches which gained for him the Pugin Studentship two years ago. They comprise plans and elevations of Chetham's Hospital, Manchester, Winchester Cathedral (including a good sketch of the tower and crossing from the north-east), a detail of the stone sedilia in Heckington Church, drawings of Leverington Church, sketches of Walpole Church (with a detail of the oak font cover) and a drawing of the tile pavement in Prior Crauden's Chapel in the Close at Ely. The drawings are carefully executed, but the reproductions of them are by no means faultless, there being innumerable weak and broken lines. The best of Mr. Gibbons's drawings is that of the sedilia at Heckington Church, Lincs. Part II. is similarly devoted to church work, with the exception of a drawing of a door and panelling in the ballroom at Haddon Hall. To this part Mr. Frank P. Oakley contributes some excellent measured drawings of oak screens in Manchester and Carlisle Cathedrals; Mr. Gerald S. Salomons drawings of Tideswell Church, Derbyshire; and Mr. R. Vernon, Mr. Joseph Holt and Mr. C. Paterson respectively drawings of the organ screen in Middleton Church, a screen in Cartmel Priory, and elevations and cross-sections of Whiston Church, Northants. Mr. Paterson is also the author of the Haddon Hall drawing mentioned above. The sketch-book is published by Messrs. Sherratt & Hughes, of London and Manchester.

The Best English Book on Reinforced Concrete.

This is undoubtedly the best book which has yet appeared on the subject in the English language. Reinforced concrete is rapidly coming to the front in this country, and such a work as Mr. Marsh's was greatly needed. Though there are excellent books in French, they are not convenient, nor would they be popular. After a general review of the subject, Mr. Marsh deals with the various systems employed, giving short descriptions of each system in alphabetical order, which is easy of reference; the third part is devoted to materials; Part IV. to practical construction, discussing the methods employed in the erection of reinforced concrete structures; Part V. to experimental research and data deduced therefrom; Part VI. to calculations; and Part VII. to illustrated descriptions of some structures which have been erected in reinforced concrete. There are also three appendices dealing respectively with M. Considère's test to destruction of the Pont d'Ivry, prevention of leakage in concrete structures containing liquids, and works constructed by Major Stokes-Roberts, R.E., in India. Mr. Marsh's arrangement is an admirable one, and allows the subject to develop naturally and clearly. The author limits the term "reinforced concrete" to the introduction of iron or steel sections into the substance of the concrete in such a manner and in such positions as to take up those stresses which cannot be resisted by the concrete unaided. In the author's opinion a joist surrounded by concrete is not reinforced concrete, but rather protected ironwork, as the joist bears all the stresses. A reinforcement employed in an unscientific manner greatly reduces the economy of this form of construction, as in such a case there will always be a waste of material and also a reduction, or rather no increase, in the elasticity of the concrete in tension. The part relating to calculations is elaborate and covers most forms of construction. It is concise and clearly written. The formulæ for slabs and beams, although giving somewhat smaller dimensions than those recommended by M. Christophe in "Le Beton Armé"—deservedly considered a standard work on the subject, and to which Mr. Marsh is chiefly indebted—are still well on the side of safety, and tables and diagrams are given with the object of saving the labour necessary in making the requisite calculations. The author adopts the theory for calculations based on the elasticity of the materials, although some constructors adopt empirical rules, and we may quote the following words from the book on the point: "To arrive at the true principles on which to base theories for obtaining the areas of the concrete and reinforcing sections many tests have been made and many theoretical formulæ have been established, but they have been carried into practice in very few instances, and consequently have seldom been subjected to the test of practical working. Although much has been done of late years by experiments, and mathematical reasoning based on the elastic properties of the materials, there are still some doubts to be cleared away and phenomena to be explained. Theory based on the elasticity of the materials, which is of necessity the true one, has not been used up to the present time by a great majority of the patentees or constructors of the several systems of reinforced concrete, nearly all of these using more or less empirical formulæ, and some no formula at all. The properties of the materials when combined are still under dispute, some engineers maintaining that the concrete, by having a reinforcement of iron or steel, obtains different properties than those it has when alone. The behaviour of reinforced concrete in works and in tests made to elucidate this point certainly seems to point in this direction, but there still remains a great deal of diversity of opinion upon this and other matters relating to the theoretical treatment of reinforced concrete." Although the author has dealt somewhat extensively with materials, this is the portion of the subject we think more attention should have been paid to; the chemistry of iron and steel is complicated, and that of cements almost equally so, while the nature of aggregates and water for mixing, and temperature, all have their bearing on the strength of the work, and much of the discrepancy that arises in experiments may be traced to neglect of proper study of this. The book is very fully illustrated with 512 views and diagrams.

"Reinforced Concrete," by Charles F. Marsh, A.M.I.C.E., A.M.I.M.E. London: Archibald Constable & Co., Ltd., 16, James Street, Haymarket, price 31s. 6d. nett.

DRAWING INSTRUMENTS.

WE are in receipt of two useful instruments manufactured by Mr. W. J. Brooks, namely, a parabola curve and a flexible curve. The former is accurately cut in transparent celluloid by specially designed appliances, and its axis, focus and latus rectum are engraved on it. It is of obvious utility as a set curve for draughtsmen, although primarily intended for students of the mathematics of the parabola. The curve is accurately constructed for use on squared paper, the unit being 1in. As to its use in geometrical conics, it will come in handy for drawing the curve $y = x^2$ (this graph can be used for reading off squares and square roots of numbers) and to solve an equation of form $x^2 - x - 1 = 0$. The flexible curves are made in three patterns: (A) a flexible strip of transparent celluloid or steel provided with tabs at intervals along its whole length, the curve being held in position up to the 8in. size by placing the fingers of one hand on the tabs, while the pen is used with the other, or, in the larger sizes, by securing the tabs by weights or drawing pins; (B) a self-clamping steel strip retained in any shape by means of a stiff-hinged linkwork attached to the tabs; and (C) a self-clamping steel strip specially designed for drawing long curves such as are required by ship- and boat-builders, made in sizes from 1ft. up to any length, the tabs in this type being held in position by light wooden cross-bars sliding through brass spring clamps and thereby held friction-tight against a long wooden bar running the length of the curve. These instruments are well made, and are deserving of adoption by draughtsmen having to settle problems for which they are designed.

Prof. D. A. Low's improved drawing appliances will appeal to almost every draughtsman, and we are happy to welcome them. Prof. Low is well-known for his books on geometry, &c., and he has done considerable service in devoting his attention to drawing instruments with such good results. His appliances comprise several designs of set-squares, adjustable protractor set-squares, tee-squares, protractors, scales, &c. These were introduced about a year ago, but the small stock was quickly exhausted, and the makers have since acquired greater experience and knowledge of their manufacture, the finish has been much improved, and the printing on the protractors and diagram measures has been made more indelible. The set-squares have bodies of a strong and tough white wood edged with transparent celluloid or with hard ebonized wood, as preferred. These are framed and faced with thin white polished celluloid. The celluloid facings give great strength to the squares, enabling them to be made much thinner than the framed set-squares which have been in use hitherto, and they are exceedingly light and convenient to handle; while the faces which come in contact with the paper, being smooth and white, any speck of ink or dust is at once seen and can be easily wiped or washed off. A special feature is that the thin celluloid facings leave off within about $\frac{1}{10}$th of an inch of the drawing edges of the square, so that when a square is resting on the drawing paper the drawing edges stand above the paper to the extent of $\frac{1}{100}$th of an inch. This slight elevation of the drawing edge above the paper does not interfere with accuracy in drawing, and it is found that in inking-in it reduces very considerably the chances of blotting or smearing. The tee-squares are made on the same principle as the set-squares, the edges being likewise in celluloid or ebonized wood, as preferred. A vector set-square is an immense aid in drawing stress diagrams. Professor Low's design consists of two arms at right angles to one another, and a movable arm hinged at the junction of the other arms. This arm can be turned and set at an angle at once. An adjustable protractor set-square to various designs and sizes is stated to be in preparation, consisting of a right-angled part and a segmental part working inside the angle, the circular edge of which has a tongue fitting in a corresponding groove on the angular part. The circular edge is graduated in degrees, so that the straight or drawing edge may be set at any angle from 0 degs. to 90 degs. A new form of protractor printed from an accurately engraved plate on thin white celluloid is very serviceable. The new cheap drawing scales printed on thin strips of wood are much superior to the usual kind on cardboard. An instrument for measuring the areas of irregular figures, and specially useful for determining the mean effective pressure from indicator diagrams from steam, gas and other engines, consisting of a piece of clear transparent celluloid, is also very useful.

Brooks's parabola curve, price 1s. Brook's patent flexible curves; prices: Pattern A, 4in. celluloid 9d., 8in. celluloid 1s. 6d.; steel: 16ins. 2s. 6d., 24ins. 3s. 3d., 32ins. 4s., 40ins. 4s. 9d., 42in. 5s. 6d., 56in. 6s. 3d.; Pattern B (steel) 9in. steel 3s., 18ins. steel 6s.; Pattern C (steel), 1ft. 4s. 6d., and 2s. 6d. each additional foot; (lancewood) 2ft. 12s. 6d., 3ft. 16s. 6d., 4ft. 21s. London: W. J. Brooks, 33, Fitzroy Square, W.

Prof. D. A. Low's improved drawing appliances. Set-squares 45 degs. 4ins. to 12ins.; 60 degs. 6ins. to 17ins., price 1s. to 4s. 6d. Tee-squares, 18ins. price 3s. 6d., 24ins. price 5s., 31ins. price 6s. 6d. Adjustable protractor set-square, 7ins. by 4½ins., price 2s. 6d. nett. Vector set-square, 7ins., price 1s. 9d. nett. Celluloid protractor, 3ins. radius, price 6d. nett; 4ins. radius, price 9d. nett. Sets of drawing scales 9ins. long, price 1s. nett; 12ins. long, price 1s. 6d. nett. Diagram measurer, price 1s. nett. London: Longmans, Green & Co., 39, Paternoster Row, E.C.

NORTHERN OUTFALL EXTENSION.

ON Saturday last the Northern Polytechnic Building Students' Association paid its first visit, to the northern outfall enlargement works extending from Old Ford to Plaistow. The students were conducted over the works by Mr. M. H. Marshall, one of the engineers, and were able to see the new sewers from the commencement of excavations in parts to the finished stage. Two new sewers of 9ft. internal height are being built (directly by the side of the old sewer), these being increased to four in number and decreased to 7ft. internal height at Stratford to pass under the Stratford Road, which does not allow sufficient head room for the larger sewers. The land in this district being of a very marshy nature, the foundations to the sewers are built in the form of a sunk concrete viaduct, the arches of which spring from concrete piers taken down to a hard bottom at a depth of 26ft. below the inverts. The sewers are horseshoe-shape with blue-brick inverts and are built in three rings, the bricks used internally being hard smooth facing bricks, and those externally wire-cuts. The concrete is composed of 8 parts ballast to 1 part best Portland cement, and it is interesting to note that over each gang of labourers mixing concrete there is an inspector. Where carried over roadways or over the River Lea the sewers are built up of cast-iron sections, supported between girders 10ft. deep.

The various difficulties that had to be contended with, and the methods adopted to overcome them, were pointed out by Mr. Marshall. In two places the sewers pass under railways—at Old Ford under the North London Railway and at Stratford under the Great Eastern Railway. At one place they are to pass over the London, Tilbury and Southend Railway, where a new bridge is to be erected in place of the present brick arches, and the old brick sewers are to be replaced by cast-iron sewers supported between the girders. In all cases the sewers have to be built without interfering with the traffic in any way, necessitating careful underpinning. For this purpose balks of timber are being prepared to support the rails during operations, those for the North London Railway, where the traffic is not very heavy, being 16in. by 16in. pitch-pine, while those for the Great Eastern Railway, where trains continually pass, weighing as much as 100 tons, are 24in. by 24in. oak balks. The work of underpinning will necessarily have to be done at night or on Sunday mornings, when traffic is somewhat quiet. This vast undertaking gives work to a great number of men, while there are in use about a dozen steam cranes and two locomotives. The whole of the work is being carried out by the London County Council at a cost of about £500,000.

BACTERIAL TREATMENT OF HOUSE DRAINAGE.

AT last Thursday's meeting of the Sheffield Society of Architects and Surveyors Mr. A. E. Turnell read a paper on "The Bacterial Treatment of House Drainage." He said it had long been known that the complex elements of which organic bodies were built were broken down and reduced by decomposition to their simpler forms, but it had only comparatively recently been realized that this change was brought about by the agency of the organisms present in these bodies, whose number and activity were increased by some alterations in the physical conditions by which they were surrounded. Sewage was an ideal nidus for bacteria, but it was a breeding place only, for as far as they were at present aware there was no such thing as spontaneous generation among these organisms, as they were all normally present in other spheres and under less favourable conditions before they were mixed up with or became part of the sewage. The satisfactory purification of small quantities of sewage was now an accomplished fact.

At the present time there were from 10 to 12 reorganized processes for the biological purification of sewage, which were only variations of the principle of cultivating the different species of bacteria present in the sewage itself. These processes were open and closed septic tank, with single and double contact beds, open and closed septic tank, followed by continuous filtration and single and double contact beds alone. The septic tank, or more properly speaking the cultivation tank, was the old cesspool slightly improved and dignified with a high-sounding name. This tank was the home of the anaërobes, which broke down, made soluble and liquified the organic compounds present in the sewage. The cultivation bed was the home of the aërobes, whose chief functions were those of oxidation and nitrification, and the solids in suspension in the sewage after treatment on this bed almost disappeared. A cultivation tank and bed could be built at very small cost, and sewage treated by this method might be turned on the land or into a stream without fear of further putrefaction or of causing a nuisance to adjoining estates.

Obituary.

Mr. Alexander Robertson, builder, of Newport, Dundee, died last week.

Mr. H. T. Neilson, quantity surveyor, of Darlington, died recently, aged 59.

Mr. G. Fowler Jones, F.R.I.B.A., of Malton, formerly of York, died on March 1st, aged 87.

Mr. S. J. Thacker, A.R.I.B.A., of Rottingdean and Totland Bay, died in London last week in his 73rd year.

Mr. T. D. Barry, architect, of Liverpool, was buried on Wednesday last. He retired about ten years ago, having been in practice since 1845.

THE ARCHITECTURAL ASSOCIATION.

Mr. Lanchester on Law Courts.

A MEETING of the Architectural Association was held on Friday evening at 18, Tufton Street, Westminster, the chair being occupied by the president, Mr. E. Guy Dawber, F.R.I.B.A.

The president announced the Committee's nominations for the House list for 1905-6 as follows:—*President:* E. Guy Dawber. *Vice-presidents:* John Murray and Louis Ambler. *Committee:* R. S. Balfour, Walter Cave, F. Dare Clapham, H. Gregory Collins, Alfred Cox, J. B. Fulton, Theodore Fyfe, J. S. Gibson, H. T. Hare, R. P. Jones, Arthur Keen, F. Lishman, Geoffry Lucas, Arnold Mitchell, H. Passmore, W. A. Pite, E. A. Rickards, J. MacLaren Ross, S. J. Tatchell, Maurice E. Webb, R. Douglas Wells, A. Needham Wilson.

Mr. H. V. Lanchester then read a paper on "Law Courts," illustrated by plans of the new Cardiff Town Hall and Law Courts, now approaching completion from designs by Messrs. Lanchester, Stewart & Rickards (illustrated in our issue for December 28th last). He said:—

When you kindly invited me to read this paper I selected law courts as the subject not so much in the hope of being able to contribute very much to the knowledge that most of you already possess, as because it seems to me that of the various problems in planning that the architect is called upon to solve this is one that involves the use of nearly all the expedients that are demanded, and is perhaps the most typical of the methods to be adopted in matters of arrangement, while at the same time there is considerable scope, in larger examples at all events, for the study of

Architectural Expression.

In this matter the Continental nations are noticeably our masters. Comparing most of our public buildings with those of equal importance abroad, while we find that at home they are too frequently pinched and ineffective, wedged into irregular sites between commercial premises, abroad we see a massive and imposing pile, its dignity enhanced by judicious isolation from all mean and unworthy surroundings, approached by a noble avenue or a spacious square. The rooms are lofty, the corridors wide, and everything is calculated to impress one with the importance of the building and its uses; but as far as ingenuity of arrangement goes, it is inferior to the cramped little concern familiar to us at home, and as regards the specific provision for its purpose, very little study seems to have been expended; in many cases an outline plan would hardly inform one whether the building was municipal, legal or residential in its intention, while few modern plans in our own country would fail to show at a glance whether they were for town hall, law court or palace. Lest we should feel inclined to congratulate ourselves unduly, it behoves us to consider whether we do not attach too much importance to our clever little schemes for specializing the routes and entrances in our designs, and whether the Englishman's mania for privacy is not carried beyond what is either essential or desirable. I certainly incline to this view myself, and think that we should occasionally make some concessions in minor points, if by such a course we can strengthen—if one may use the term—the dramatic force that a fine architectural treatment exercises. As an example of the importance attached abroad to worthily and suitably expressing the purpose of such a building, one need only cite the law courts of Brussels, where the intention of impressing the mind with the power and dignity of the law is so successfully fulfilled. The courts at Paris, though most interesting in themselves, are less suitable as an example, for, in spite of Dues's masterpiece, they represent, as a whole, a gradual aggregation which cannot be regarded in the same light as a completed study from one hand.

London Law Courts.

While far from desiring to detract from the design of our own courts of justice, combining as it does remarkable grace of detail with vigorous composition, it must be admitted by all that the internal arrangements fail, both from a practical and an architectural point of view, the chief defects being the divorce of the great hall from the courts and the consequent meanness of the approaches to the latter.

Manchester Assize Courts.

One of the most striking and typical examples of assize courts is that at Manchester, by Mr. Alfred Waterhouse, of which a plan is published in the "Transactions" of the Institute of June 12th, 1865. If you refer to this you will note the skill with which the somewhat complex problem is met, and, taking into consideration the fact that the public galleries are practically on the same floor as the courts, the satisfactory separation of the officials, bar and witnesses, with the consequent avoidance of awkward cross-currents.

You are doubtless familiar with the plan of the

Birmingham Courts,

which are universally considered to be most admirably arranged. In this case the large hall is in daily use, as it serves both police and assize courts; in fact, the latter are very much used throughout the year, and the large hall is a great convenience.

In the case of the

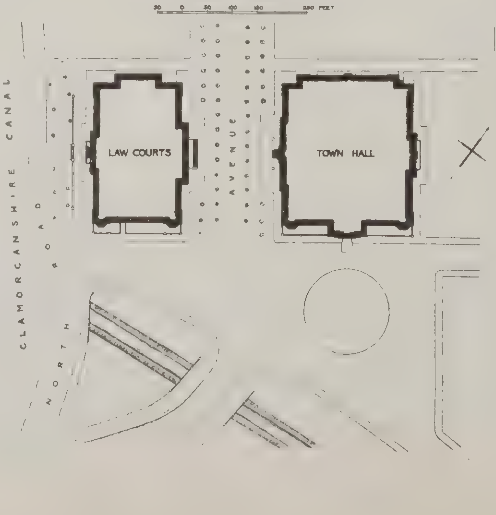
Old Bailey Courts

the site was a somewhat limited one for the accommodation required, and on this account the problem is treated in a simpler manner. As most of you have recently visited the building, it is hardly necessary to embark on a detailed description, and it may suffice to mention that the courts are grouped in two adjacent pairs, separated by the main staircase and lighting area; while a corridor in front serves witnesses and bar, and another behind the bench, the judges, and juries, the barristers' rooms are on an upper floor, and a suite at the south end of the building is provided for the Lord Mayor and City authorities.

Cardiff Law Courts.

Very fortunately for us, the site provided for our work at Cardiff is quite an exceptional one, and though not laid out with the skill that one sees exercised in France or Germany, it is nevertheless of a noble spaciousness and liberality, so that the buildings stand four-square, open on all sides, and the façades only broken by the surrounding trees. The design of the Cardiff courts was to a great extent governed by the relation of the building to the town hall on the east side, to which it corresponds in architectural detail and in its dimensions from north to south. This also suggested the arrangement of the assize courts and their adjuncts on an upper floor, though such a course is in this case justified on economic grounds alone.

CARDIFF MUNICIPAL BUILDINGS
BLOCK PLAN



The very general objection to placing the courts on the first floor is to some extent met by the arrangement of the steps, those not external forming, as it were, part of the design of the assize hall or *salle des pas perdus*.

You will, I trust, understand that in illustrating my paper by means of these plans, it is not with any idea of their representing a standard type; as a matter of fact, the conditions themselves preclude such a supposition; but that such a course makes it easier for me to formulate the various points with which I ought to deal.

With the plan before us, I should mention that the buildings include the following:—

The Assize Courts.
Police and Wreck Courts.
The A Division Police Station.
The Chief Constable's Offices.

Beyond pointing out on the plan the accommodation allotted to the two latter, I do not propose to refer to them, as they present but few variations from the usual practice. Basing our ideas on the examples quoted, it will be best to commence with the

Assize Courts,

and taking one of these and its surroundings in detail, the practical problems that I referred to at the commencement of this paper will become obvious.

We shall not then need to consider the lesser courts at the same length, as they will follow to a large extent the same principles. You have in those attending the court the following six main divisions:—1, judge; 2, jury; 3, bar; 4, witnesses, solicitors (and litigants in civil cases); 5, prisoner and police; 6, public—each of which it is desirable to keep to some degree distinct, while the first two must be able to pass direct to their retiring-rooms without emerging into any of the general corridors.

You will see at once that it is practically impossible to secure this degree of sub-division on one floor, but the removal of the public to an upper gallery and the provision of steps from the dock to a lower floor for the prisoner simplify things very much.

A corridor in front of the court will serve division 4, and also jurors in waiting and when discharged. Corridors on one or both sides will provide for the bar and officials, while the judge enters (through his private room) from suitable access provided at the back of the bench. Thus we may mentally picture as the ideal arrangement a central block consisting of the court plus the judge's and jury's retiring-rooms, surrounded by a corridor, outside which are suitably placed the various rooms for officials, bar, witnesses, &c. Taking this as a starting-point, it will almost inevitably occur that exigencies of lighting, access, &c., will demand modifications; for instance, the courts may require to be grouped, as at Birmingham and the Old Bailey; the site may be too small to allow of all the rooms on one level, as at the High Courts; or, again, the lighting of a lower floor may have to be considered, as is the case in our building at Cardiff. At the High Courts of Justice the officials' and barristers' rooms are very ingeniously dealt with on a mezzanine below the judges' rooms, &c., at the back of the bench; the bench being raised, these rooms are conveniently near the level of the court. On the other hand, the jurors' retiring-rooms are not well managed, being in the basement, two floors below the court level. The witnesses' rooms are next in importance, and if it is difficult to place those in close proximity to the courts, an enclosed space may be provided at the back of the court for witnesse immediately wanted, though I think the more usual provision of a few seats in the court and a good room close at hand preferable.

The Grand Jury,

an important factor in the conduct of our assizes, need not be in such close touch with the court, as it only assembles there at the commencement of the session to receive the judge's charge, and then withdraws to deal in a preliminary way with the cases. It hears sufficient evidence to decide whether a case should proceed or not, and its communications are handed in to the clerk in the form of a "true bill" or otherwise.

The grand jury, twenty-four in number, is drawn from the magistracy and more important residents in the circuit.

It is a general practice to put its rooms on an upper floor with an opening into the court by which the bills can be delivered on the usual "fishing-rod." The arrangement of our building enabled us to put a gallery in the court which would accommodate the grand jury while being charged, but it is very possible that judges will prefer to have them in the body of the court instead.

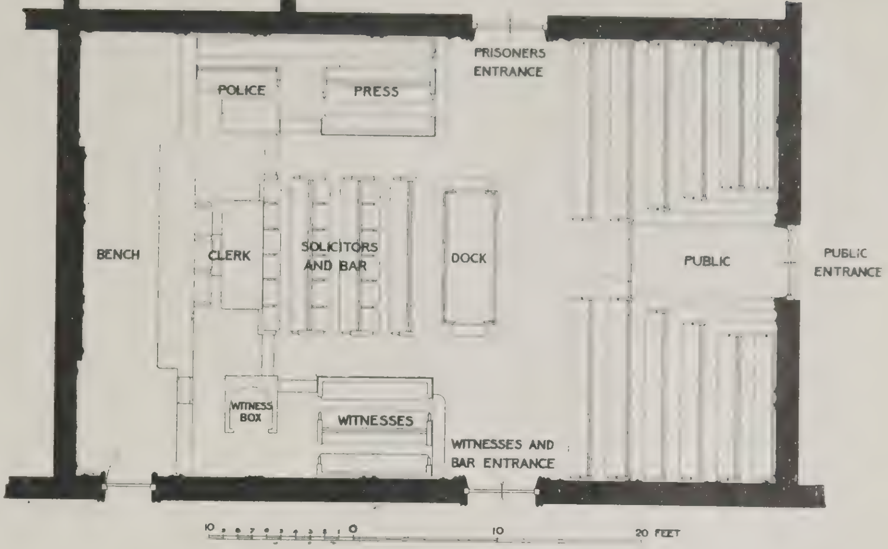
Before going into the arrangements of the courts themselves it is worth while to run through a short schedule of those for whom accommodation must be provided.

(Schedule below.)

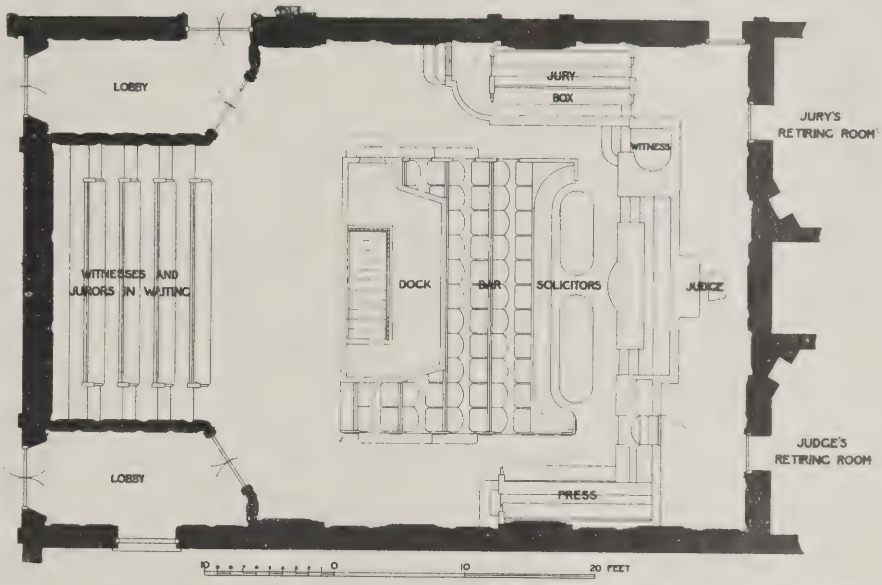
Details of Court-room.

We now come to the details of the court-room itself. Taking assize courts first, we find that the usual form of court is now a short oblong with a width of 30ft. to 40ft. and a length of 40ft. to 60ft., but at Gloucester the courts (erected some sixty years back) are semicircular in form, with the seating in concentric semicircles struck from the judge's throne; this arrangement seems a good one, both practically and architecturally, and might, I should imagine, be more frequently employed where the site is suitable. We will assume, however, that the rectangular plan is adopted. After arranging for the bench, which should be about 25ft. long by 6ft. or 7ft. in width, and raised 2ft. 6ins to 3ft. above the floor of the court, the chief point on which any difficulty arises is the position of the witness-box; this should not be less than 10ft. or more than 12ft. from the judge, and should again be within

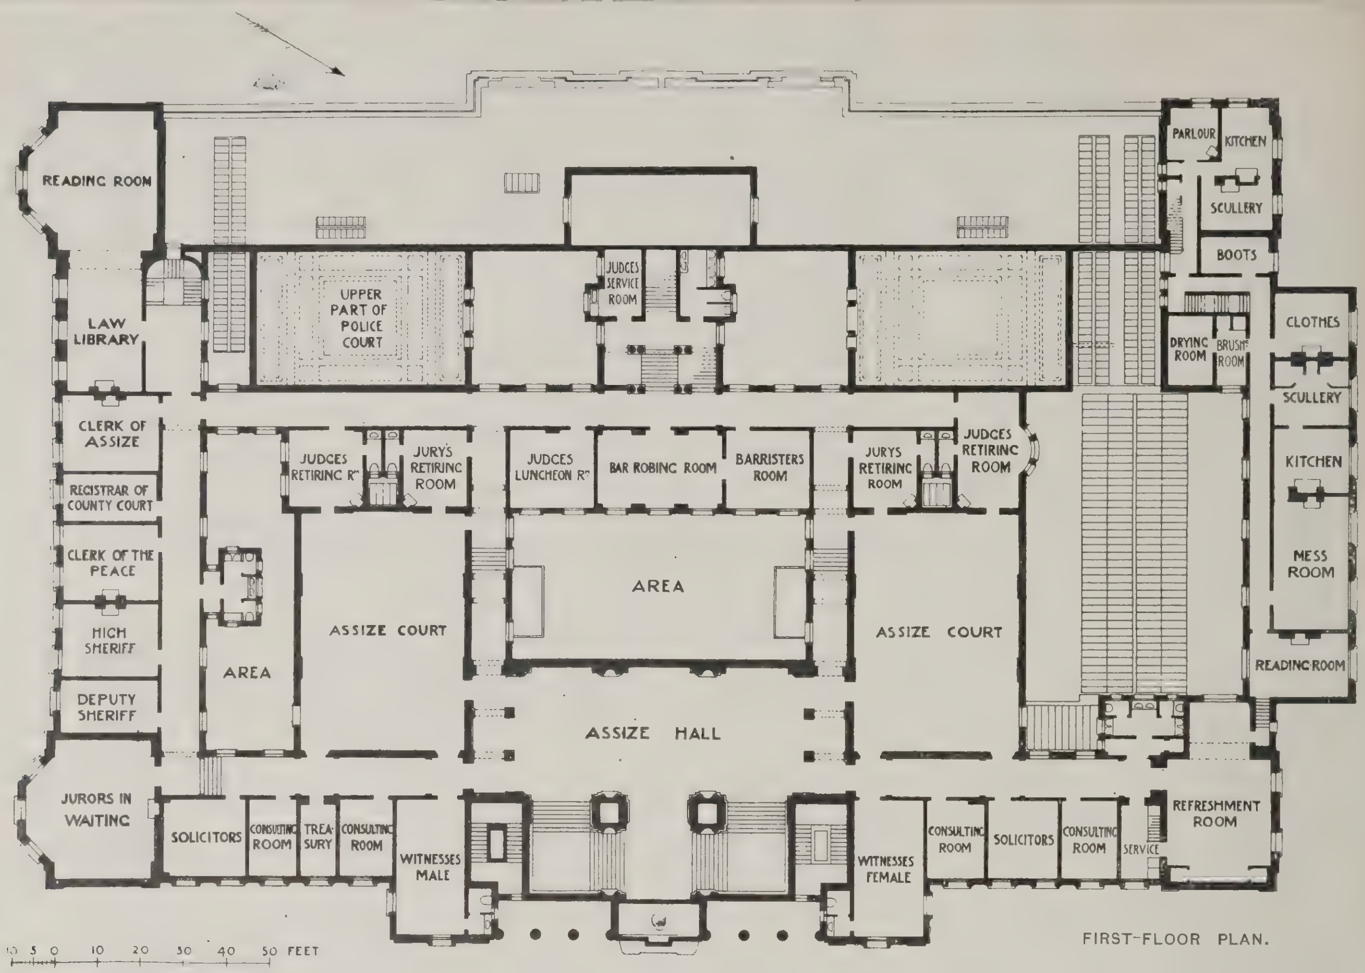
PLAN OF POLICE COURT CARDIFF



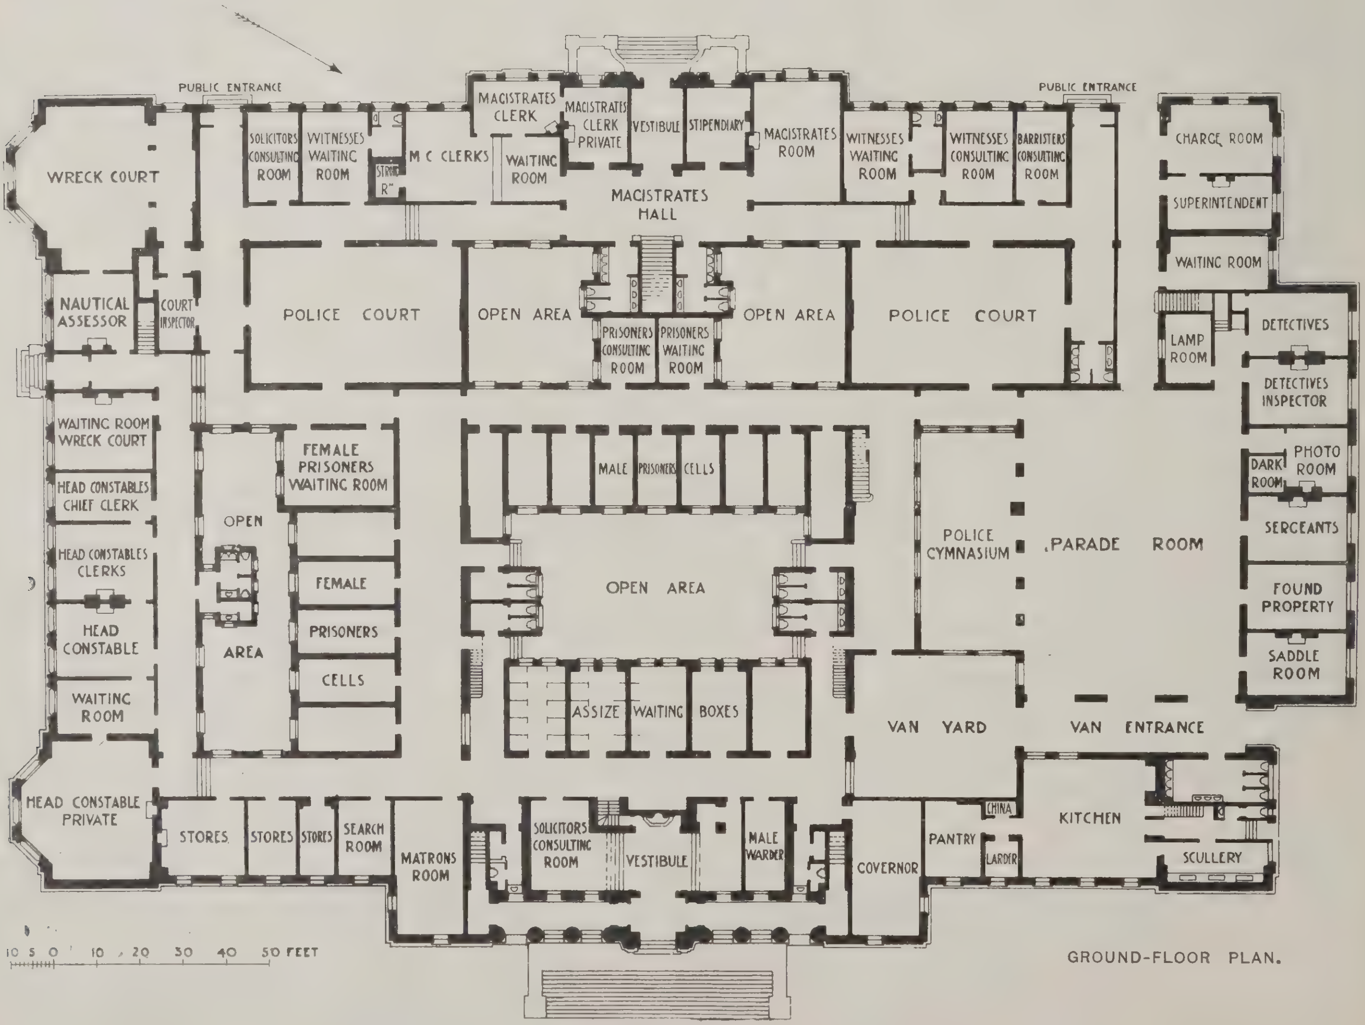
PLAN OF ASSIZE COURT CARDIFF



(1) Assize Court. (Criminal.)	Sheriff. Deputy Sheriff. Judge. Judge's Marshal. ,, Clerk. Assistant Clerk.	Jury of Twelve. Jurors in waiting.	Bar.	Witnesses and Solicitors. Ushers. Official Reporter. Press.	Prisoners. Warders. Police.	Public.
(2) Assize Court. (Civil.)	As above.	As above.	,,	As above and Litigants.	None.	,,
(3) Quarter Sessions. (Appeals from police and petty sessions in minor cases; licensing cases.)	Magistrates with Chairman of Bench or a Recorder Clerk.	None.	,,	Applicants. Witnesses and Solicitors.	Prisoners and Police.	,,
(4) Petty Sessions. (Country police court.)	Magistrates or Stipendiary Clerk.	None.	,,	Prosecutors. Witnesses and Solicitors. Press.	Prisoners and Police.	,,
(5) Police Court.	Magistrates or Stipendiary Clerk.	None.	,,	Prosecutors. Witnesses and Solicitors. Press.	Prisoners and Police.	,,
(6) Wreck Court.	Stipendiary. Nautical Assessor. Clerk.	None.	,,	Ship's Officers. Witnesses and Solicitors. Press.	None.	,,
(7) Sheriff's Court. (Compensation cases and assessment of damages.)	Deputy Sheriff. Clerk.	Jury of Twelve.	,,	Plaintiff and Defendant. Witnesses and Solicitors.	,,	,,
(8) County Court.	Judge. Registrar. Clerk.	Jury of Five.	,,	Plaintiff and Defendant. Witnesses and Solicitors.	,,	,,
(9) Coroner's Court.	Coroner.	Jury of Twelve.	,, (Occasionally).	Witnesses.	Occasionally prisoner under escort.	,,



FIRST-FLOOR PLAN.



GROUND-FLOOR PLAN.

LAW COURTS, CARDIFF. LANCHESTER, STEWART AND RICKARDS, ARCHITECTS.

12ft. or 14ft. of the examining barrister and the jury. If much further than this the witnesses' replies may not carry, and the facial expression, which is sometimes important, may escape observation. It is more usual to put the witness on the other side of the judge to that occupied by the jury, with the advantage that the witness practically faces the jury-box when under examination, but with the disadvantage that remarks audible to the barrister and judge may not reach the jury, who are generally less inclined to interpose in asking the witness to speak up. After consulting authorities of great experience, we decided to place the witness-box on the jury side, pushing the latter slightly further down the court than usual, so that they get at least a profile view of the witness. The witness-box should be 2ft. above the floor, and should have a small table-top for documents or other articles produced in evidence. In front of the bench, and about a foot below it, are seats for the judge's clerk and officials assisting him, and in front of these on the floor of the court the tables and seats of solicitors, while on the opposite side to the jury-box are placed the official shorthand writer and the Press. Behind the solicitors sit the barristers, and behind them is the dock. In the court where civil cases are heard this dock is convertible into additional seats for the bar, or for special witnesses, experts, &c., while the back of the court provides for witnesses and jurors-in-waiting.

Police Courts

follow much the same general arrangement, with the exception that no jury-box is required, while the cases are usually disposed of much more rapidly. The public may either be in an upper gallery or on raised staging at the back of the court. The prisoners are usually brought into the dock by means of a staircase from below, but at Cardiff they come in on the level from the cells corridor, which runs along the side of the courts; to our mind this is the more expeditious method. You will see that in our building these courts are approached from three sides, and that the grouping of the two avoids cross lines of traffic as far as possible in such a case.

The Wreck Court

is presided over by the stipendiary and a nautical assessor, and deals with such cases as its name implies, those attending being chiefly engaged in the mercantile marine.

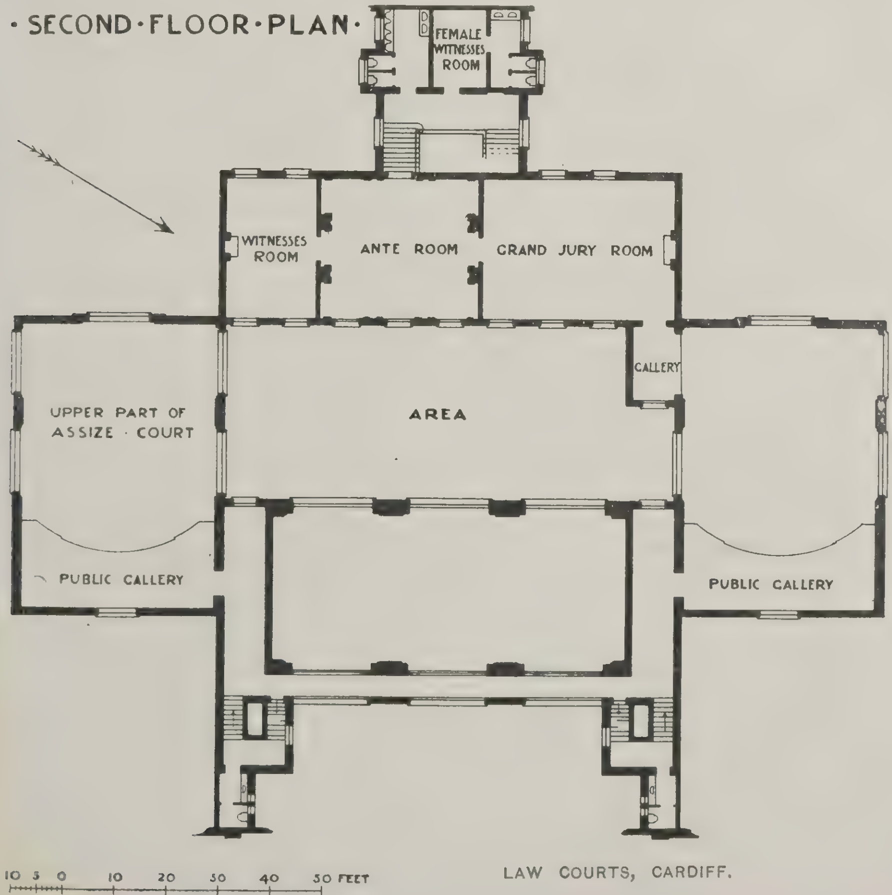
Heating.

The buildings are heated by the atmospheric steam system, the steam being slightly below atmospheric pressure; the boilers are in the basement of the town hall, and pipes are brought through a subway connecting the two blocks; the courts and other rooms are supplied with fresh filtered air driven by electric fans through steam-heating batteries, and carried by means of ducts and flues to suitable points. Extraction flues and ducts are carried to blowers in the two towers. It may interest you to hear, what I only knew myself a few days ago, that this is practically the same system as was adopted in the court rooms at Manchester over forty years ago; though, of course, many variations in detail have developed in the meantime. At all events, experience has proved that for rooms as much occupied as courts some form of mechanical ventilation is essential.

You have, I imagine, formed a fair general idea of the requirements in buildings of the class under consideration, and not wishing to extend these remarks unduly, I propose only to refer briefly to the general character which might be expressed architecturally in law courts.

Treatment.

A certain austerity should, without doubt, be the prevailing note, but this should be most emphasized in the justice chamber itself, where the presence of ornament and useless accessories would be distinctly out of place. The assize hall, however, presents an opportunity which is scarcely to be found in any other description of building Severe in treatment though it should be, it is yet a link between the outer world and the solemnity of the tribunal; as it leads to the various departments, and has to provide for the freest perambulation, it includes more than one vista, and affords scope for the romantic treatment associated with an exchange or public loggia where the learned might exercise the imagination and find inspiration in a sense of space and rhythmic form such as a well-designed apartment of this importance and character should suggest.



LAW COURTS, CARDIFF.

A feeling of the open air, quite apart from the matter of ventilation, should be imparted. Any sense of confinement would effectually mar the relief which such a hall affords to those who have felt the tension of a hardly-fought case. Balconies to the open air, provided their outlook is not too exciting, would be valuable as adjuncts, and mysteries of light and shade might be sought for.

A considerable uniformity of material would seem to be desirable, such as could be secured by a vaulted room in stone with a stone floor tempered by the introduction of other materials, if they are used only in the broadest way

Such a hall offers great opportunities of an almost purely architectural character, and the use of ornament and sculpture need not be excluded, though these adjuncts are capable of a freer treatment in the exterior of the building. It may be remembered that a "palais de justice" is not a prison, and that in the hands of an artist dignity and balance may achieve a result typifying the magnificence of the law, which is no terror to those who have no reason to fear it; and a palace of justice as a monument to a merciful institution might well have some elements of gaiety in its composition.

A short discussion followed in which Mr. Francis Hooper, Mr. E. A. Rickards, Mr. Baxter Greig and Mr. Dawber took part.

The president announced that the next meeting would be held on March 24th, when Mr. A. Needham Wilson would read a paper on "Sketch Plans and Working Drawings."

The students' smoking concert, which is being organized by some members of the Association, and at which it is hoped that many art students from the Academy, Slade and other schools will be present, is to be held at the Monico, Piccadilly Circus, on Tuesday, March 28th, at 9 p.m. (morning dress). Tickets 2s. 6d.

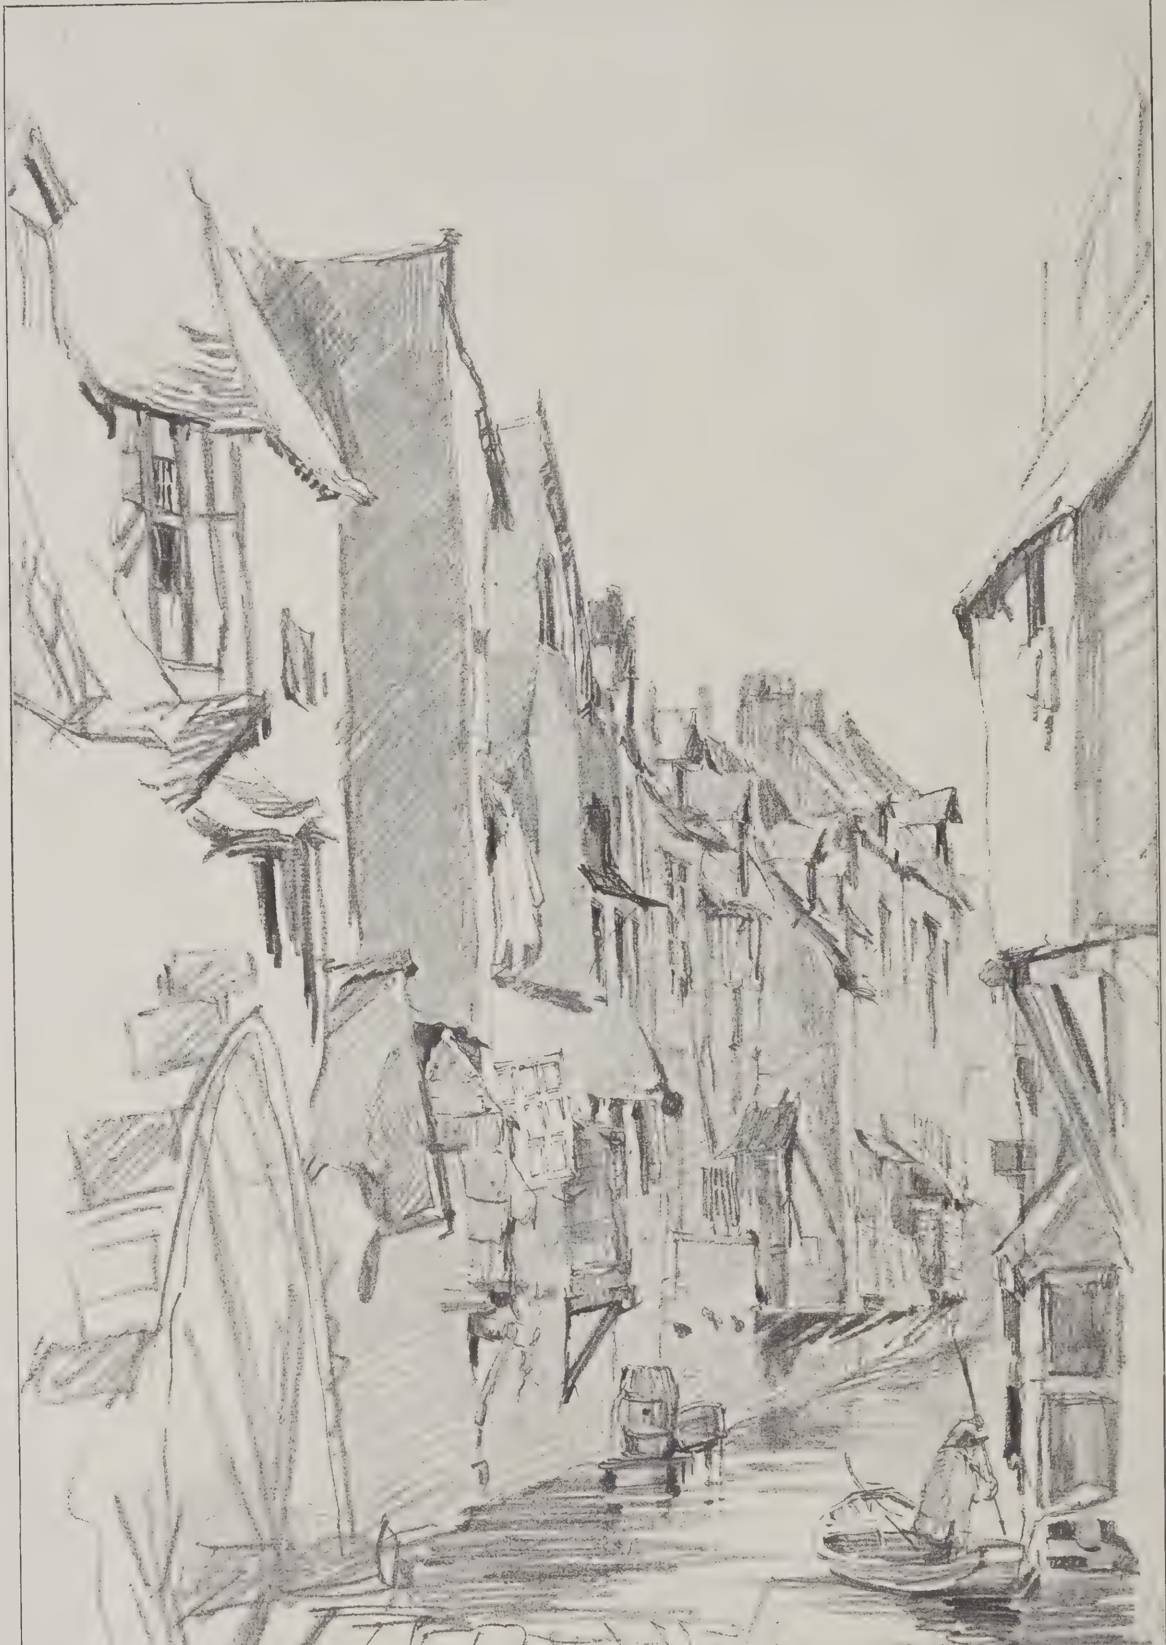
Reinforced Glass Steps are made by the Glass Co. of Saint Gobian, France. They are formed with glass slabs, and are said to be fire-resisting, durable, not at all slippery, and capable of sustaining heavy weights. They are made up to 10ft. in length and have a wire skeleton embedded in the centre.



A CONTINENTAL SKETCH BY THE LATE J. BURGESS, OF LEAMINGTON.

Builders' Notes.

London Master-Builders' Association. — Mr. Frederick Higgs has been elected president for the current year.

South Wales Master-Builders. — The quarterly meeting of the South Wales Master-Builders' Federation was held at Cardiff last week, when the scheme of a conciliation board was approved.

Royal Institute of Public Health.—In connection with the London Congress to be held in the Regent Street Polytechnic from July 19th to 25th there will be an exhibition of educational, sanitary and hygienic appliances.

The Columbian Fireproofing Co., Ltd., of 37, King William Street, London, E.C., has secured the contract for floors and roofs at the new elementary schools at Kingston-on-Thames; also the steelwork and floors in the new power-house for Messrs. Tate & Sons, sugar refiners, at Silvertown.

A neat Insurance Diary and Pocket Book, with four pages of information concerning the Blount door-check, has been published by Messrs. Charles Winn & Co., of St. Thomas Works, Granville Street, Birmingham, who will be pleased to post a copy to anyone in the trade. We are glad to see that the firm's name has not been splashed all over the book, but that Messrs. Winn & Co. have published it in a modest form. The pages of squared paper will be found very useful.

A new Thames Wharf.—At last week's meeting of the Thames Conservancy an important scheme was agreed to for the erection of a new quay about six miles above Gravesend. The quay will be about 6,600ft. long and 58ft. wide, and on the landward side of it will be 10 transport sheds, each 300ft. long and 61ft. wide. The work is to be commenced within twelve months from the date of the granting of the Thames Conservancy licence, and will extend over two years. The estimated cost is £1,000,000.

A Massive Crane Gantry is nearing completion at Messrs. Harland & Wolff's shipbuilding yard, Belfast. It is 190ft. high, 650ft. long, 18ft. at the base, and weighs nearly 6,000 tons. At the summit is a rapid-running cantilever crane 230ft in length. The cranes on either side of the cantilever run on a projecting railway, and each is capable of lifting 10 tons when at full out-outreach, or 20 tons when extended 70ft. Three-phase current for the crane is supplied by 12 motors with a gross capacity of more than 400-h.p. The cost of the structure will be £80,000, of which £12,000 has been expended on the foundations alone, a large amount of piling and some thousands of tons of concrete having been necessary.

Aberdeen Painters' Strike.—A conference between the operative painters on strike in Aberdeen and the masters' association took place last week. Numerous points were settled amicably until the issue was narrowed down to the by-laws dealing with the date of the signature of the working rules and the question of the employment of labourers to do work which, the operatives contended, should be done by painters. The keenest discussion took place over the first point raised by the men—"that employers notify any proposed change in the by-laws by March 1st every year." The masters contended, in the first instance, that the date of signature should be January 1st in each year, but were prepared after discussion to make the date February 1st. The operatives, however, clung to their point, and the result was a deadlock so far as the date of signature was concerned. The second question on which there was considerable difference of opinion was the demand by the men "that labourers shall not be employed by any employer in doing painting, glazing or papering work." The employers were willing to give way on the point as to the employment of labourers for painting, but not in the matter of glazing and papering work. The men insisted on the adoption of the whole by-law as they had presented it. On this point, as on the former, the parties could not agree, and the final result of the conference was that while both parties were at one on most of the points raised, they could not agree on the two mentioned — the date of signing the by-laws and the question of the employment of labourers.

Correspondence.

Cottages with Bathrooms.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—In reply to 'J. H.,' I am well aware that the connection of bath to copper in a similar way to mine has been done, but I have never heard of a bathroom on the ground floor before. The advantage I claim for my plan is the privacy of a separate room, with hot and cold water, giving the maximum of convenience with the minimum of trouble. Almost all cottages in this district have two rooms beside the kitchen, so there is no drawback in connection with the copper and sink.—Yours truly,

IPSWICH. W. H. DEATH.

English v. Foreign Granite.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Permit me to contradict Sir John Jackson's statement, made at a recent Exeter arbitration, that British granite masons are less reliable than foreign ones. In your issue for last week, as well as in numerous other contemporary papers, Sir John Jackson is reported to have said: "Englishmen go off drinking so often. The Norwegian takes a fortnight about once a year, drinks for a fortnight and has done with it." I have visited granite quarries in Norway and Sweden on several occasions, and have nothing to say against their operatives. But as an employer of granite masons in my own yard for nearly forty years, I never knew one go off on "the booze" for a week together, let alone for a fortnight. As a class, granite masons—whose work is certainly more laborious and demands greater muscular energy than does any other branch in the building trades—are steady men. I have those in my employ who, save during the usual public holidays, have not lost a day—nor half a day—during the last ten years. The British granite mason is, as a rule, an exceptionably steady workman. Sir John only knows what he is told. I speak of what I see directly under my own nose.—Yours truly, HARRY HEMS.

EXETER.

[Speaking at Penryn last week Mr. Douglas Hall, prospective Conservative candidate, said the cost of British granite was not more than 3d. per foot, or 3s. 6d. a ton, in advance of foreign granite, and the reason why foreign granite was brought into this country at a cheaper rate was because the foreigners worked longer hours, were satisfied with a less standard of comfort, and laboured under conditions which Englishmen would not care to submit to. Another thing was that in Norway and other places the fair-wage clause was utterly inoperative, and for that reason he could not understand that foreign granite should be admitted in Government contracts. He was told by people who knew that on every £1,000 granite contract £666 went in wages to the working men—more than on almost any other manufactured article. For that reason he maintained in general that there ought to be a heavy protective duty on granite.]

A Practical Labour Saver.

Hall's Distemper only requires water added to be ready for use.

Its covering power is unequalled by any similar material. One cwt. of Hall's Distemper will cover double the surface of one cwt. of pure white lead paint, with 40% less cost in labour.

Good walls require no preparation.

Hall's Distemper works easily, sets hard, and dries with a uniform surface, equal to flatted oil paint.

Made in two qualities for Inside and Outside work.

Sample and Shadecard on application to Sissons Brothers & Co., Ltd., Hull. London Office—199 Boro' High Street, S.E.

CAUTION-See the name Hall's Distemper on all tins; refuse imitations, which are inferior.

ROOFING SLATES:

Velinheli, Penrhyn, and Westmoreland.

MONTHLY

FIRE SUPPLEMENT

TO THE

BUILDERS' JOURNAL AND ARCHITECTURAL RECORD.

Edwin O. Sachs, F.R.S.Ed., Architect,
Consulting Editor.

Number 5.
March, 1905.

SUMMARY.

The Institution of Electrical Engineers' rules for wiring, as they stand at present, are not sufficiently stringent for the temporary wiring found constantly at bazaars, exhibitions, temporary ballrooms and the like, and the sooner this matter is remedied in the Institution's rules, and supply companies follow suit, the better for the consumer of electric light. (Page 62.)

The Long Acre Fire of February 22nd serves as an instance of the everywhere increasing risk of the rapid spread of fire in the congested areas of the Metropolis, and at the same time illustrates the danger of the increasing quantities of petrol to be found in manufacturing premises in London. The latter matter should call for careful investigation. (Page 64.)

Mr. Justice Buckley's judgment in connection with the L.C.C.'s requirements as to safeguards against danger from fire at the City Mills building appears to make it practically impossible for the Council to deal with any "old" factory premises other than those which are wholly in one occupation and those the whole of which are occupied as factories, the mechanical power for which is supplied from one common source; and it would be easy for the owner of a factory building, by letting such building to more than one occupier, to nullify the provision of section 14 of the Factory and Workshop Act, 1901. (Page 65.)

Taken as a whole, as far as fire protection is concerned the Building Act Amendment Bill of the London County Council is obviously a good one, and, further, in the interests of the future development of the Metropolis. We are somewhat astounded at the intensely ignorant and interested opposition to the Bill manifested in the City area, and our astonishment is still greater when we remark a small Bill which has been quietly lodged on behalf of the City Corporation in which powers quite as drastic, if not more drastic in certain directions, are desired by that body. (Page 66.)

It would be well if the primary principles of how to deal in case of fire with specific theatres in given areas were thought out and made subject to some kind of tactical exercise, as, for instance, the war game as played in the Army. A step in this direction has been taken by Chief Officer Dittman, of Bremen, who has schemed out various methods of handling various kinds of fires that might occur at the theatres in his city. (Page 72.)

Attention needs to be called to the increasing hazard of fire occasioned by the telephone service, a hazard which does not only refer to the actual premises of such exchanges but also refers to the property over which there are standards carrying the telephone wires. (Page 67.)

TEMPORARY BALLROOMS.

Mr. Lionel Phillips's Fire at Grosvenor Square.

In our leading article of February 15th we commented upon the action that Mr. Lionel Phillips, of Grosvenor Square, brought in such a public-spirited manner against a firm of caterers in respect to a ballroom that was burnt down just before an evening party he was about to give.

We call this temporary erection a ballroom, the more common expression for the canvas temporary erections used for entertainments of this kind, though, as a matter of fact, on going into the matter we find that this temporary structure was to be used not as a ballroom but as a supper-room.

We consider the case to be such an important one in the interests of the safety of life that we have been at some pains to gather full particulars, and we have had some photographs and drawings put at our disposal, which should materially assist to elucidate the circumstances.

As we have indicated before, as far as the plaintiff was concerned, Mr. Lionel Phillips's case was an unusually well-prepared one from the technical point of view, the solicitors in charge, Messrs. Braunstein & Skelton, having gone into the matter very thoroughly and having retained experts of high standing, who also assisted very materially in the preparation of models, diagrams and the like.

The case was not won by Mr. Lionel Phillips, the jury unfortunately taking the view that the actual cause of the outbreak was not proven, and thus of course the alleged neglect of the caterer was not judicially shown. We think the jury took a mistaken view, particularly if we read the careful summing up by the judge, but of course it was an extraordinarily difficult case to prove by circumstantial evidence, and if the jury gave the defendant caterers the benefit of a doubt, no more can be said than that it was fortunate for the defendants that the case was not tried by the judge alone or, as a matter of fact, decided by any one with a legal training. It is extremely regrettable that an example could not be made of the caterers, who were a representative firm of a trade that so obviously does not think it worth while to give any thought to the question of fire protection generally or to the safety of clients, quite irrespective of any question of electrical defects in this particular case.

In this supplement we present a plan and sections showing the location of the temporary building and its relation to the permanent structure. We also show two photographs of the ruins after the fire, and further some diagrams indicating what kind of wiring was adopted in applying the so-called "looping" system with miniature lamps for the illumination of the temporary room.

As to the general tenour of the circumstances, we think it cannot do better than to quote two journals, which should necessarily if anything be inclined to overlook electrical failings, seeing that they represent the engineering professions. The two journals in question are "Engineering" and the "Electrical Review," the former of which gives a terse general illustrated article on the subject, whilst the latter gives a very trenchant leader. We will quote the article from "Engineering" at considerable length, with a view of obtaining a description of the circumstances and the views of this highly-respected contemporary, whilst regarding the "Electrical Review" we will give the opinions therein expressed.

We trust that this case will in the first place have the due consideration of the Institution of Electrical Engineers, and in the second place the consideration of the British Fire Prevention Committee within whose sphere a case of this kind certainly comes for action. We further trust that the London County Council, and particularly the Committee entrusted with the administration of the London Building Act, will consider this case, and that it will, lastly, be brought to the notice of the Home Office.

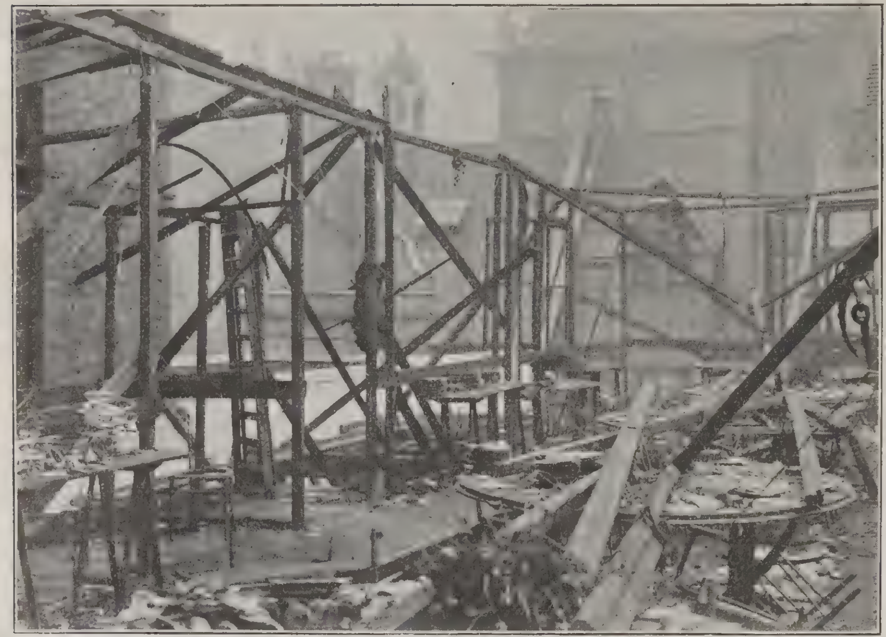
The Circumstances.

"Engineering" states as follows:—

In short, this was a case where a wealthy amateur proposed to arrange an evening party and concert, practically regardless of expense, and for this purpose had a large temporary supper-room erected at the rear of his private residence, on the top of a back addition at first-floor level. The temporary structure was of the usual wood skeleton frame and canvas type, to hold about 200 persons, and small electrical incandescent lights were fitted to serve as the illuminant.

A few hours before the party was to commence—*i.e.*, about dinner time—a fire broke out in this temporary structure and destroyed it entirely in the course of a few minutes. It further did considerable damage to the house, the flames entering the latter through the back windows. According to the official report sent out to the insurance companies by the London Fire Brigade, the cause of this fire was a defective electric circuit; and although the jury did not take the view that this cause had been proved in such a way as to make the caterers liable for damages, yet the result should be to cause greater care to be expended on these temporary installations in the future than has sometimes been done in the past.

Had this fire occurred during the course of the party it seems certain that a number of fatalities must have resulted, for in many respects this structure was even of a more dangerous character than that of the fatal Charity Bazaar at Paris. It was perched



RUINS OF THE GROSVENOR SQUARE TEMPORARY "BALLROOM," LOOKING TOWARDS STABLES.

aloft on the back addition, as indicated in our illustrations, and anyone attempting to break through the sides of the canvas, in case of panic, would have dropped down into deep areas. There were only two exists—one through the first-floor back room of the house direct to the main staircase, and one down some temporary stairs. The plan which we publish shows that there was a dead end of that dangerous type to this temporary building that is the veriest death-trap on such occasions. The plan illustrations show also the location of this temporary structure and its relation to the house.

Given the requirements of a temporary building in such a position, it would, of course, only be natural to anticipate that the greatest possible care would be observed in its erection. In these enlightened times one would have expected the use of non-inflammable materials throughout, as is customary at public functions. One would have anticipated that the simplest and safest system of electric installation would have been applied, amply guarded by plenty of fuses; and one would not have expected any additional risks to be run by entwining electric lights with ordinary muslin of the most combustible kind. It should be remembered that there was no question of expense, and that the contractors had an entirely free hand, *i.e.*, were able to use their discretion.

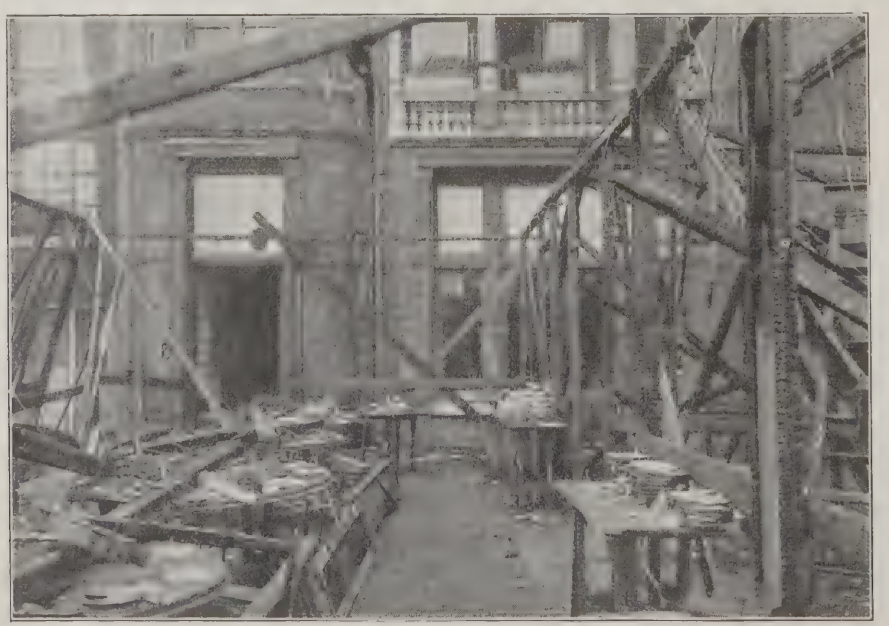
No one apparently having seen the actual outbreak of the fire, the duty of proving the electrical cause rested with Mr. Lionel Phillips, and, what is more, it was necessary for him to prove negligence. He was not able to do this, but we believe that the publicity of the case will serve as a lesson to the catering and allied trades. Put in short, Mr. Lionel Phillips had to show that the system of electric light adopted was a dangerous one, negligently applied, and, further, that due precautions were not taken in the general outfit of this supper-room. The system of lighting actually applied was what is generally known as the looping system, which, although at all times not the simple and safe one that could be desired in such temporary work, is distinctly a dangerous one when used with miniature lamps, which create such considerable difficulty in being connected up. Colonel Crompton, who is not prone to exaggeration, described this system with the application of such miniature lamps as a "diabolically dangerous one" having regard to the purposes for which it was applied. Mr. Swinburne concurred with this expression of Colonel Crompton's and such other expressions as clearly defined this method of installation as one which is attended with risks that should not be undertaken if possible to avoid.

There is one point, however, on which the defendant was naturally able to make an impression on the jury, and that was that there is no prohibition in any wiring rules regarding this special form of temporary installation; and we would here point out that we hold that the Institution of Electrical Engineers should elaborate their rules to cover these points and points relating to temporary wiring generally. There can be no doubt about it that the Institution of Electrical Engineers' rules, as they stand at present, are not sufficiently stringent for the temporary wiring found constantly at bazaars, exhibitions, temporary ballrooms and the like, and the sooner this matter is remedied in the Institution's rules, and supply companies follow suit, the better for the consumer of electric light. Perhaps this point as to the necessity for elaboration of the Electrical Institution's rules may be said to be the primary lesson of the case.

Some Lessons.

Another important lesson which, although it has long been learnt by consulting electrical engineers, has not yet been sufficiently recognized by the ordinary minor electrical contractor, is that the supply companies' ordinary test is not a test in respect to the satisfactory character of the wiring from the fire point of view, but is simply a test for insulation. There is a general and, unfortunately, very popular belief that the companies' test practically means immunity from risk of electrical fires; but this is wrong, and we think the supply companies in their own interests should make this fact a great deal plainer to contractors and private parties when corresponding on this question of tests and the issue of certificates. We are of course fully aware what is meant and what stands as written in the rules and instruction books of supply companies to their staffs on this matter, but the popular belief that the supply companies' tests mean immunity from the risks of fire should be broken down at the earliest possible moment.

The third lesson on the electrical side is undoubtedly that it is very much in the insurance companies' interest to extend their electrical staffs, and to organize them on a thoroughly practical and efficient footing. We are of course aware that some companies are most ably managed in this direction, and that although they would be the last to officially own to it—seeing that officially they do not recognize the value of fire prevention—a great deal of substantial fire-preventive work is done by the companies in this special direction. We should not forget that it was an insurance company's surveyor—who has recently retired—who was practically the father of wiring rules and inspections in this direction, but a great deal more should be done on the insurance side. If statistical records were also carefully kept by the companies as to the causes of outbreak of fire, we think the percentage of electrical fires would be a great deal higher than we estimate. We are of course conversant with the fact that first-class contractors and work done under experienced consulting engineers stand high in this country; in fact higher than in most countries; but the amount of slipshod work done by incompetent minor firms, generally of the plumber and ironmonger type, is simply appalling, whilst the modern tendency for caterers, co-operative stores, furniture dealers, office-fitters, &c., to do work outside their own ken, and to take on electrical wiring both permanent and temporary, must mean grave risk. Even here, in the case we have under review, we have the defendants getting in the box and



RUINS OF THE GROSVENOR SQUARE TEMPORARY "BALLROOM," LOOKING TOWARDS THE HOUSE.

naturally saying that they knew nothing about electricity and that this department was left to some subordinate or to some sub-contractor as to whose competence or knowledge of the subject they did not furnish any conclusive testimony. The insurance companies, no doubt, have the greatest possible facilities for doing fire-preventive work in this direction of electrical supervision, and, if ably handled, such work will always be welcome to the better-class consulting engineer and electrical contractor.

The fourth lesson in respect to this unfortunate fire is one in respect to the necessity of this class of temporary building coming under supervision of our building authorities. Should anyone wish to break a door through an internal wall in his house, or, in fact, make any minor structural alteration, the builder or owner comes under the supervision of the local district surveyor. Should a temporary building be erected of corrugated iron, or a shed of the factory type be desired, these buildings come under the supervision of the London County Council. Temporary buildings of the "stand" type come under the control of the borough councils, although we believe there are still a number of points at issue between the London County Council and the boroughs as to where their respective control commences or ends. But we nowhere find that this class of temporary ballroom of the tent type comes under official regulation except where it be used for public entertainments, when it would come under the Theatres Committee of the London County Council for purposes of licence.

And now the final lesson; without going into any further matters of detail. Throughout this case it was obvious that the contractors had really not had the question of fire prevention in their minds at all. There was not so much as a single pail of water or a single hand-pump available to meet an emergency of this kind. It really is most regrettable that in such work of this kind, executed regardless of expense, there should not have even been an attempt at the commonest form of protection in the direction of a few buckets filled with water to meet a possible outbreak of fire. Ignorance may in a way serve as an excuse in respect to dangerous wiring, and conservatism for an absence of flame-proof materials, but these will not account for the absence of even a single fire-bucket, the most elementary of all safeguards.

Electrical Opinion.

The "Electrical Review" says:—

In the course of expert evidence great emphasis was laid on the fact that the looping system was utilized with small miniature lamps. Experts like Colonel Crompton and Mr. Swinburne were most emphatic as to the dangerous character of the temporary wiring done, and we are sure most electricians would agree that this system with tiny lamps is not appropriate for risky and hurried work of this kind. The defendants tried to show that the looping system with miniature lamps was common practice, but they failed to do this. They also tried to show that the use of non-inflammable materials round electric lamps was not customary at private entertainments, although of course it is a recognized essential at all public entertainments under the L.C.C. control. They argued that they had followed the Institution of Electrical Engineers' wiring rules as to fuses, &c., and we think they had certainly done this; but it should be borne in mind that these rules were intended for permanent work. The general impression that the case made was, firstly, that of callousness in the direction of risk of fire, *i.e.*, that there was no thought as to the electrical risk of the fancy

F.G. 7.

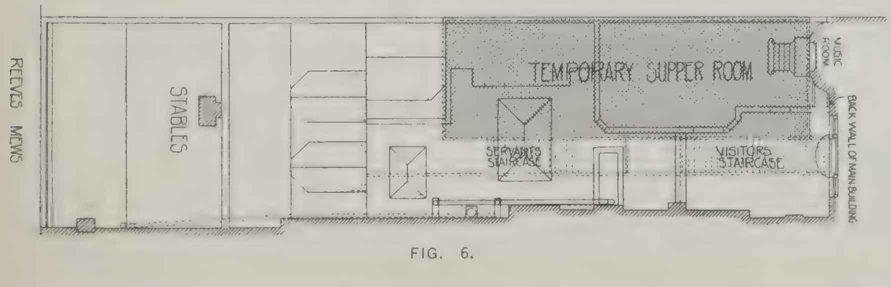

FIG. 6.

SKETCH OF THE GROSVENOR SQUARE TEMPORARY "BALLROOM" AND SOME ELECTRICAL DETAILS.

lighting adopted, nor any thought as to what would happen if there was a "short." This callousness went so far that there were not even any fire appliances about. To put it plainly, there was no recognition of risk at all either on the fire-preventive or fire-extinguishing side.

The next point that was brought out was that although the wiring rules of the Institution of Electrical Engineers may be excellent for permanent work, there should certainly be a supplement pointing out the necessary additional safeguards for temporary work.

Another point was to the effect that laymen contractors seem to pin their faith in respect of questions of safety to the ordinary insulation test conducted by the supply companies, which is of course a fallacy.

Lastly, it was shown that temporary buildings of this character should certainly be quite as much under the supervision of the local authorities as, say, an ordinary temporary building of the iron shed type that has to have a licence, and is certainly of a more substantial character than a canvas one.

Altogether, the case brought some very strong points to light as to the general indifference as to question of safety in temporary work, both constructional and electrical. We trust that those interested in this class of work will take the lesson to heart.

THE LONG ACRE FIRE.

(February 22nd, 1905.)

WE give one of those excellent insurance plans, prepared by Mr. Charles E. Goad, which shows the location of this fire, which occurred in the morning of February 22nd, and resulted in quite a number of buildings being gutted and damaged, supplemented by some special photographs taken on the spot which give some idea of the nature of the property affected.

The fire was a very fierce one, owing to the character of the premises affected, which were poorly constructed and filled with a considerable amount of woodwork, both finished and unfinished, such as motor-car bodies and the like. But an important factor in the severity of this fire must have been the large amount of petrol stored in the various buildings, sometimes, it is true, only in quite small containers, but together constituting a considerable bulk.

The fire originated in the back premises of a building facing Long Acre and bounded on the side by a narrow passage. It spread southwards towards the corner of St. Martin's Lane and Long Acre, getting into various buildings from the back. The fact that the whole corner was not destroyed by fire was solely due to the efforts of the fire brigade, which assembled very promptly and got to work in a most admirable manner, the excellence of the fire-brigade arrangements throughout being the subject of much comment.

Some thirty-eight steam fire-engines were brought into action at this fire, which will give some idea of the quantity of water required in order to limit its extent. The entire Salvage Corps was also brought into service, and did good work in saving a number of very valuable motor articles and other carriages.

The fire was at its height between 8 and 9.30 a.m., and owing to a strong wind required very careful fighting. The area affected, as will be seen from the plan, is quite considerable, particularly behind the buildings fronting Long Acre. It is a matter of congratulation that the fire did not spread across that thoroughfare to any marked extent. Only in one instance, namely, in the case of Messrs. Stanford's premises, did the buildings on the south side of Long Acre catch fire, and this, we believe, was due to flying woodwork which dropped on the roof. The insurance values must have been considerable on this occasion, as the contents were valuable, individual motors costing as much as £700 or more.

The fire serves as an instance of the everywhere increasing risk of the rapid spread of fire in the congested areas of the Metropolis, and at the same time illustrates the danger of the increasing quantities of petrol to be found in manufacturing premises in London. The latter matter requires serious thought, and should call for careful investigation.

THE CITY MILLS BUILDING FIRE.

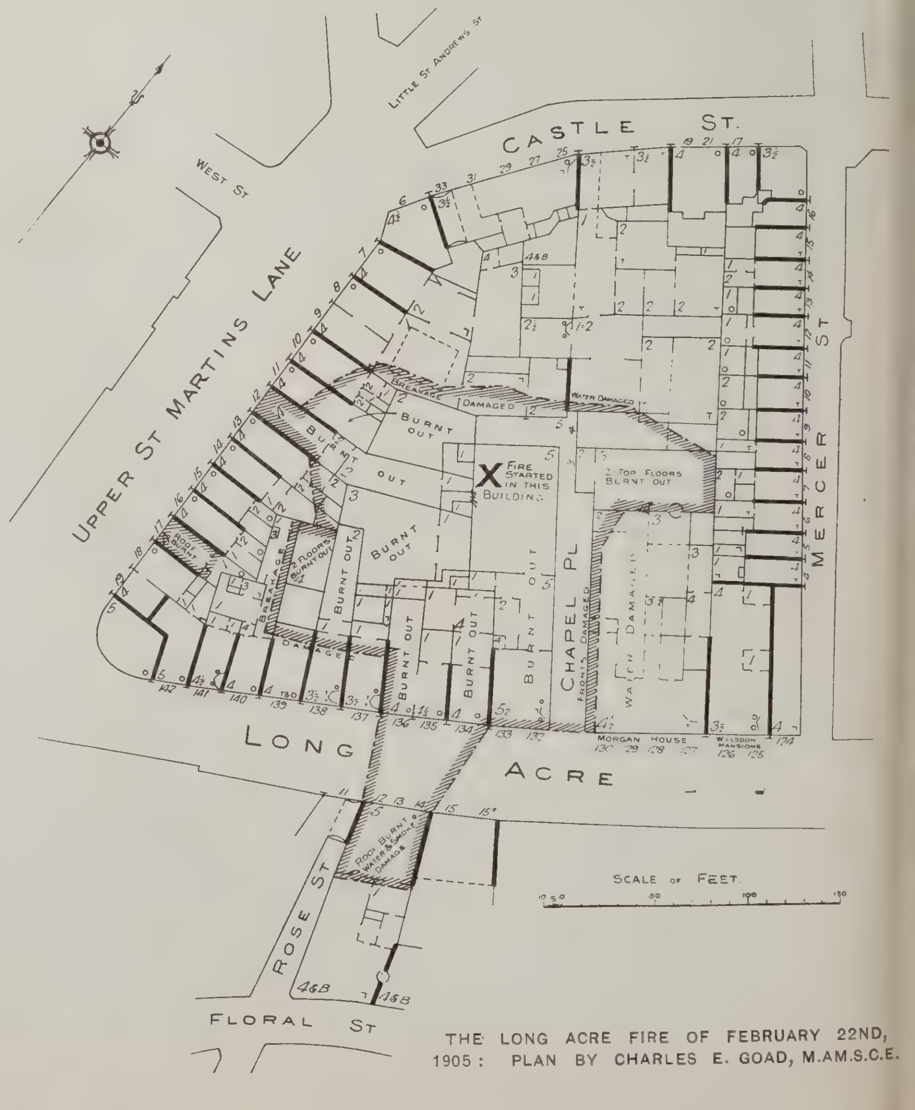
NO example of greater force could have been afforded as to the necessity of revising the Building Act from the fire point of view than the circumstances of the City fire at the City Mills building, Upper Thames Street, in January. Here we have an instance to show how essential it is for such building legislation to be of a retrospective character.

As to the history of the building in question, frequent attempts have been made by the London County Council to reduce the risk of fire in buildings of this kind. We give below an extract from a report the London County Council has decided to send to the Home Secretary on the matter, and we would particularly remark that in the opinion of the London County Council the Bill drafted by the Corporation of the City of London and dealt with elsewhere in this supplement, would not cover a case of this kind.

The L.C.C.'s Earlier Action regarding these Premises.

The County Council Building Act Committee reports as follows:—

On 7th October, 1902, we submitted a report to the following effect:—These premises, which are situated in Upper Thames Street between Wheatsheaf Wharf and Puddle Dock, and about at the rear on the river, consist of basement and ground floors with seven floors over. The seventh floor is about 72ft. above the street level and is occupied by Messrs. J. F. Farwig & Co., as are also the sixth and fifth floors. The fourth and third floors are occupied by Messrs. Spiers & Pond, and are used as a factory and for grocery, packing and despatching, and as a store. The second floor is occupied by Messrs. G. Wright & Co., and is used as an engineer's shop and ironfounders' and hardware store. The lift near the north-east angle of the premises used by Messrs. Spiers & Pond is enclosed on this floor by means of a revolving iron shutter only, and in the event of a fire occurring below, this floor might become involved through the lift. The first floor is occupied by Messrs. Spiers & Pond and is used for composing, letterpress printing, hardware packing, and as a store for hardware, furniture, stationery and glass. The ground floor is occupied by Messrs. J. F. Farwig & Co. and Messrs. Spiers & Pond, the former using the small portion in the north-west angle for an office and showroom, and the latter the whole of the remaining portion for loading and despatching grocery and hardware goods. There is also a loading way and platform on this floor, next the loading way at the northern end, used by Messrs. G. Wright & Co. The basement is occupied by Messrs. Spiers & Pond, and is used for storing wine, packing cases and wood. On the first, ground and basement floors considerable quantities of straw are stored and used in connection with the packing. The numbers of persons employed on the various floors on the occasion of the original survey made by the Council's officers were as



THE LONG ACRE FIRE OF FEBRUARY 22ND, 1905: PLAN BY CHARLES E. GOAD, M.AM.S.C.E.

INTERIOR VIEW, LOOKING TOWARDS LONG ACRE.

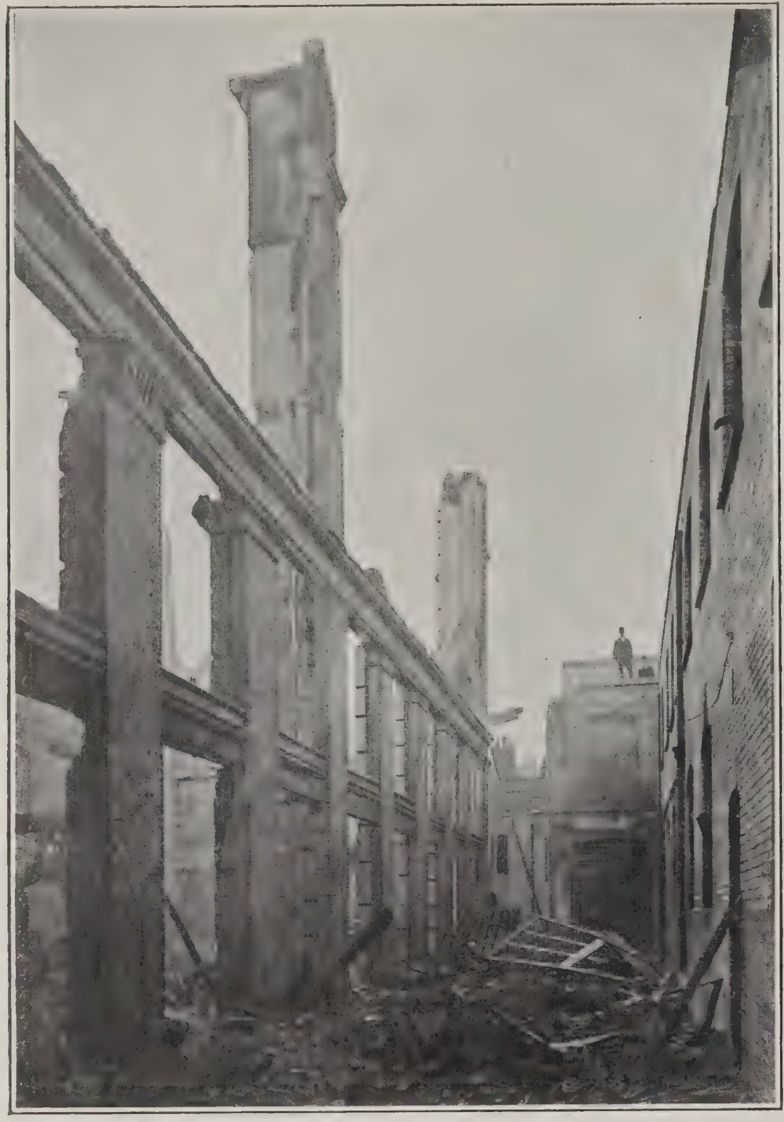
follows:—Seventh floor, 53; sixth floor, 105; fifth floor, 15; fourth floor, 10; third floor, 55; second floor, 8; first floor, 31; ground floor, 77; basement, none employed continuously; total, 354.

A sealed notice was served on the owner of the premises on 13th December, 1900, containing requirements for the provision of a brick enclosed incombustible staircase at the southern end of the building, connected with all floors and with Wheatsheaf Wharf at the ground level by doorways hung with fire-resisting doors, and requirements as to doors, handrails, &c., to the existing staircases at the northern end of the premises. The sealed notice was not complied with, and the matter was referred to arbitration in July, 1901. The award was made on 4th March, 1902, and was to the effect that the premises were used for factory purposes, and were not provided with such means of escape in case of fire for the persons employed therein as could reasonably be required under the circumstances of the case, and, further, that the need of a remedy was very urgent and took precedence of any other consideration; that the second floor was not a factory where upwards of 40 persons were employed, and that, with the exception of certain portions, which were specially excepted, it was leased to Messrs. Wright & Co., only eight males being employed on the floor; that the requirements contained in the Council's sealed notice relating to the construction of an additional staircase could not be reasonably required in the circumstances of the case, as they would involve the owner in a question of trespass on the portion of the premises occupied by Messrs. Wright & Co., but that the provision of a staircase in the position set forth in the Council's sealed notice, starting at the level of the third floor and extending up to the seventh (top) floor and communicating with the intermediate floors between the third and seventh floors, would materially diminish the risk of injury or loss of life in case of fire breaking out in any of the upper floors of the building. The award directed that the notice served by the Council should be amended so as to require the provision of such a staircase, and further, that the Council should pay the owner his costs of and incidental to the reference, and also to bear its own cost and the cost of the award.

On 27th January, 1903, we reported that an amended sealed notice, in accordance with the terms of the award, was accordingly served on Mr. Toller, the owner of the building; but Messrs. Spiers & Pond, the occupiers of a considerable portion of the building, refused to allow him facilities for carrying out the work required by the notice. Mr. Toller therefore applied for an injunction to restrain Messrs. Spiers & Pond from interfering with his workmen, and the case was heard by Mr. Justice Buckley on 11th December, 1902, judgment being given on the 16th. The judgment was to the effect that the umpire was not justified in requiring the Council to serve, and consequently the Council was not justified in serving, a notice requiring the owner to do any works for providing a means of escape for the persons employed in the portion of the building occupied by Messrs. Farwig & Co. as a factory through the portion of the building occupied by Messrs. Spiers & Pond as a factory, and conversely, that the notice could not require the owner to do works in Messrs. Farwig's portion of the building for the benefit of the persons employed in Messrs. Spiers & Pond's factory.

We pointed out that the effect of the judgment appeared to be to make it practically impossible for the Council to deal with any "old" factory premises other than those which were wholly in one occupation and those which were "tenement" factories within the definition contained in the Act, as construed by Mr. Justice Buckley, *i.e.*, premises the whole of which was occupied as factories, the mechanical power for which was supplied from one common source; and that it would be easy for the owner of a factory building, by letting such building to more than one occupier, to nullify the provision of section 14 of the Factory and Workshop Act, 1901. The judgment increased the difficulty, caused

INTERIOR VIEW. LOOKING BACK FROM LONG ACRE



THE LONG ACRE FIRE: VIEW OF CHAPEL PLACE.

by questions of trespass, which the Council had always experienced in the discharge of its duty under the Factory and Workshop Acts with respect to the provision of means of escape in case of fire. As showing the serious nature of this difficulty it was stated that of 106 cases within the City remaining to be dealt with, 26 could not be effectively dealt with owing to questions of trespass, and of these 26 cases 22 were classified as dangerous.

As the Council could not take any further action in the matter, the whole of the facts were communicated to the Home Secretary with an intimation that the Council would in future remit to him all cases with which it was unable to deal effectively under the present law.

Short Description of Building.

The building consists of basement and ground and seven floors over; the floors are in various occupations. The building is about 220ft. in depth from north to south, and there is only one means of escape from each floor, and this is situated at the north end of the building. The escape from the seventh and sixth floors is by a wood staircase of step-ladder construction in the north-west angle of the building, open on the seventh floor, and enclosed with wood partitions on the sixth floor and with brickwork from the sixth floor downwards to the street. There is no communication from the floors below the sixth floor to this staircase, and within the enclosure there is a lift shaft, divided from the stairs by a wooden partition only. A similar staircase enclosed with brick walls at the north-east angle of the premises affords escape from the fifth and floors below into the street.

The number of persons employed is 354, and the number above the ground floor is 277.

THE L.C.C.'S OPINION.

Danger to Persons employed in Building.

From a consideration of the description of the building it will be evident that the danger from fire to persons employed in the building is very great. The two top floors are occupied by persons employed in making packing-cases, and there are numerous unprotected gas stoves for heating soldering-irons. On the other floors there are great quantities of inflammable materials, especially on the first, ground and basement floors, where straw is stored for use in connection with packing and distributing goods from Messrs. Spiers & Pond's grocery stores. There is only one means of escape from each floor, and that of unsatisfactory construction; and in the event of a fire occurring on any floor people working at the end of the building remote from the staircase would have to traverse 220ft. through flames and smoke across a floor covered with obstructions. There would be no escape for a person on the upper floors if the staircase became involved, and even if access to the roof could be obtained there would be no chance of escape except by jumping from a height of about 90ft. into the street or the River Thames. It will thus be seen that a fire occurring in such a building when the work-people were on the premises would almost certainly be attended with serious loss of life.

FIRE PREVENTIVE LEGISLATION FOR LONDON.

As far as fire protection in the Metropolis is concerned, the present session of Parliament should be of momentous import to the Metropolis, for it should bring with it the consideration of the Building Act Amendment Bill of the London County Council, which is probably one of the most far-reaching, beneficial measures of its kind ever proposed in the interests of safety of life and property. As far as the fire-protective clauses are concerned, we are in full sympathy with the aspirations of the London County Council in this direction, even if we differ with them as to some of the proposed clauses: the divergence of opinion is more in the direction of wording and technicalities, and particularly more in the direction of the proposed methods of administration, than in respect to any question of structural principle involved.

Taken as a whole, as far as fire protection is concerned the Bill is obviously a good one, and, further, in the interests of the future development of the Metropolis. But we do not agree with the Council's wishes in the direction of centralization, *i.e.*, with such clauses as making it compulsory for every important building to be referred to Spring Gardens as far as its fire protective aspect is concerned. We should prefer a clear code on these points to be administered by the district surveyors. We fear that if this tendency for centralization be pursued it may cause the wreckage of the Bill, and we thus strongly advocate a clear definition of requirements in matters of detail and the retention of the present machinery of the district surveyor's offices for dealing with these fire-protective points.

Only in the case of cubic contents do we think the Council have a just claim to require reference to Spring Gardens as heretofore. As to this question of cubic contents, whilst we mention it we are under the impression that some error must have occurred in the drafting out of the Bill, for we are afraid the cubic contents that will be permissable under the proposed enactment are far in excess of what should be reasonably permitted in the Metropolis as a matter of principle.

We do not much care for some of the points in the schedule regarding fire-resisting materials, which we think require modification, but speaking generally, as indicated before, as far as the fire-protective clauses are concerned we hope the proposed Bill will become law.

We are somewhat astounded at the intensely ignorant and interested opposition to the Bill manifested in the City area, and our astonishment is greater when we remark a small Bill which has been quietly lodged on behalf of the Corporation of the City of London in which powers quite as drastic, if not more drastic in certain directions, are desired by that body. We do not think the Lord Mayor was well advised to preside at the recent meeting, and that however excellently "stage-managed" the gathering in question did no credit to civic diplomacy.

In this supplement we do not wish to go further into detail regarding the proposed Bill of the London County Council, for the subject was ably covered by a contributor to our last supplement of February. Regarding the Corporation's wishes, however, we present in full those clauses which describe what the City proposes doing:—

> 4. Subject to the provisions of this Act every existing house or building within the City shall within a period of one year from the first of January one thousand nine hundred and six be provided with a stairway or other suitable means of communication from the uppermost floor to the roof thereof and from the roof thereof to the roof of one of the buildings adjoining thereto or other adequate means of escape from fire to the satisfaction of the Corporation signified by the certificate of their officer

duly authorised in that behalf. Such stairways or other suitable means of communication or other adequate means of escape from fire shall be of a permanent character and be constructed and kept and used solely as a means of escape from fire and shall with free and proper means of access and marks of direction thereto be provided and maintained in good condition and repair and free from all obstructions by and at the expense of the owner of such building to the satisfaction of the Corporation signified as aforesaid.

5. Subject to the provisions of this Act the Corporation may serve notice upon the owner of any house or building in and upon which no such stairways or other suitable means of communication or other adequate means of escape from fire with free access thereto as aforesaid exist on the first of January one thousand nine hundred and seven requiring him to provide the same and if within six months of service of such notice he fails to comply with such requirement the Corporation may make complaint thereof before a petty sessional court who shall thereupon issue a summons requiring such owner to appear to answer such complaint and if the complaint is proved to the satisfaction of the Court the Court may make an order in writing requiring such owner to provide such stairways or other suitable means of communication or other adequate means of escape from fire with free access thereto as aforesaid or in case he fails to comply with such order within such time as the Court prescribes empowering the Corporation to provide and erect the same and recover the expense of so doing in manner hereinafter provided from the owner so in default together with any compensation payable under section 7 of this Act or the costs of any arbitration payable under that section and the expense of any such complaint and order as aforesaid.

6. The Corporation shall for the purposes of this Act and for carrying the several provisions therein contained into full and complete effect have full power and authority to enter or to order and direct their officers or contractors employed by them at all reasonable hours in the daytime to enter into and upon any house or building within the City and into and upon the land on which any house or building is built without being liable to any action at law or suit in equity or any other legal proceedings or molestation whatever for or on account of such entry or the works done or to be done in pursuance of this Act.

7. The owner of any house or building or in case of his default the Corporation may affix or secure to the party-wall roof or other suitable part of any adjoining house or building any stairway or other suitable means of communication or other adequate means of escape from fire erected in compliance with the provisions of this Act. Provided that the owner or the Corporation as the case may be shall make compensation to any persons sustaining injury by reason of negligence in the affixing or securing of any such stairway or other suitable means of communication or other adequate means of escape from fire to any house or building the amount of such compensation to be determined in default of agreement by arbitration under the Arbitration Act 1889.

8. Any person who deems himself aggrieved by any conviction or order made by a court of summary jurisdiction on determining any information or complaint under this Act may appeal therefrom to a Court of Quarter Sessions.

9. This Act shall not extend or apply to factories or workshops as defined by the Factory and Workshop Act 1901 nor to any new building as defined by section 5 (subsection 6) of the London Building Act 1894 exceeding sixty feet in height.

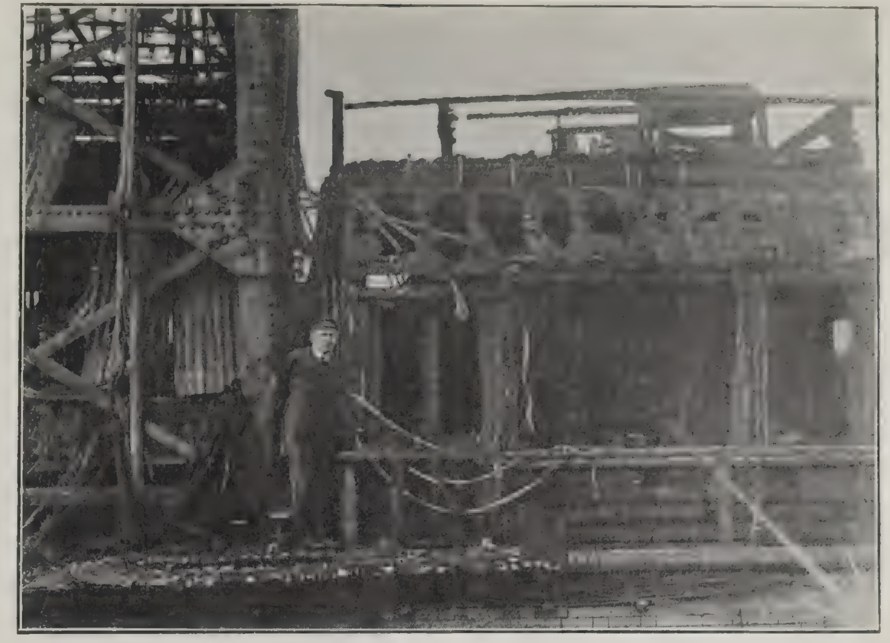
10. Any owner failing to maintain in good condition and repair and free from obstruction the means of escape from fire erected in pursuance of this Act or otherwise shall be liable to a penalty of five pounds and to a daily penalty of two pounds for every day on which the offence is continued after conviction therefor.

11. Offences against this Act and penalties costs and expenses imposed or recoverable under this Act may be prosecuted and recovered in a summary manner. Provided that costs or expenses except such as are recoverable along with a penalty shall not be recovered as penalties but may be recovered summarily as civil debts.

12. All penalties recovered under this Act shall be paid to the Corporation.

The International Fire Service Council.—We understand that the next meeting of the Executive of the International Fire Service Council is to be held in the month of April.

The St. Petersburg Fire Brigade.—We understand from a reliable source that the long-needed reorganization of the St. Petersburg Fire Brigade is to be taken in hand, and that in setting out the principles on which this force is to be henceforth managed the fire-preventive aspect is to have due consideration, as also matters appertaining to the co-operation of the fire service in fire-survey work. The problem of reorganizing the St. Petersburg Fire Brigade has been put into the hands of Chief Officer Reichel, of the Hanover Fire Brigade, whose great services in the introduction of modern methods on the Continent we frequently have had occasion to refer to, and who, as we have indicated in an earlier supplement, is the first fire-brigade officer to hold a chair on fire-protection at a royal technical college in Germany. Chief Officer Reichel is at present at St. Petersburg, engaged on this special duty.



TELEPHONE STANDARD AFTER THE FIRE OF FEBRUARY 28TH.

FIRES AT TELEPHONE EXCHANGES.

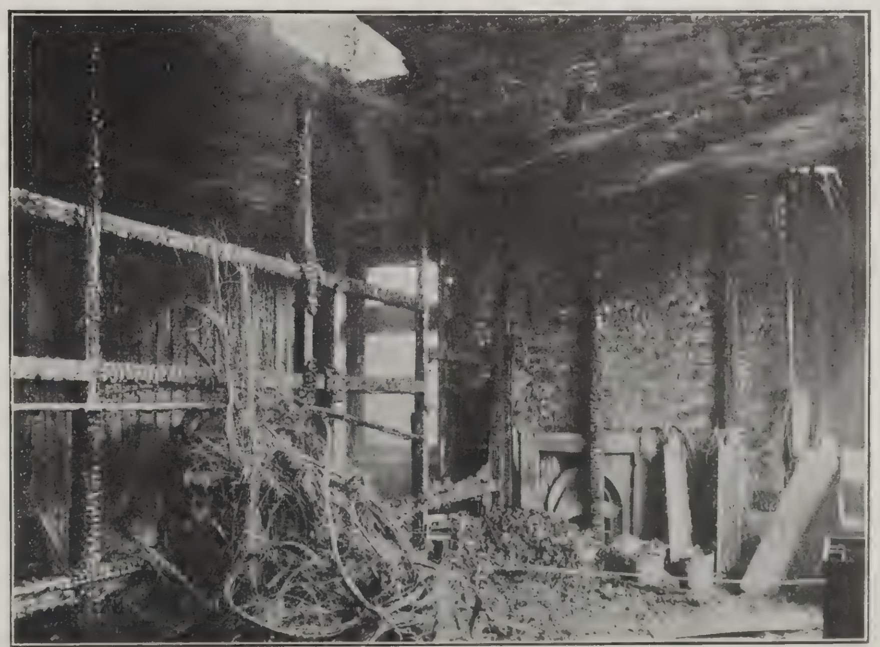
ATTENTION needs to be called to the increasing hazard of fire occasioned by the telephone service, a hazard which does not only refer to the actual premises of such exchanges but also refers to the property over which there are standards carrying the telephone wires. There have already this year been two very serious fires in connection with the National Telephone Co.'s service, and in each case, quite apart from the question of fire risk to the buildings and their occupants, there has been the disorganization of the telephone business, which has been most inconvenient to the subscribers.

We certainly think that the National Telephone Co.'s engineers would do well to accord the question of fire risk some additional forethought and care, for such accidents as have resulted from these fires must necessarily be due to neglect that can be overcome by careful supervision and painstaking management.

The National Telephone Co, it is true, has not many more years to live, for it will not be long before its service has been merged into the Post Office service, but if these fires continue the shareholders of the company will have to make up their minds to take a very different view of the value of the plant that has been constantly subject to fires, as distinct from a plant in which the average number of fires is low; for it should be remembered that as far as Government property is concerned, it is never insured; the Government simply stands the risk, and the Treasury will not be inclined to pay a high price for an installation that is not a reasonably safe one.

Of the two fires that have occurred, the one that took place in the early morning of February 28th opened up a new vista as to the difficulties the London Fire Brigade has to contend with under modern electrical conditions; for this fire, which occurred so high above street-level, was of a unique character.

Two photographs presented on this page illustrate the character of the second fire and the wreckage wrought on that occasion. They show the main standard affected and the chamber below it.



TELEPHONE CHAMBER AFTER THE FIRE OF FEBRUARY 28TH.

FERRO-CONCRETE.

From the Fire point of View.

WE are indebted to our American contemporary the "Fireproof Magazine" for the courteous loan of some excellent illustrations of details relating to the effect of fire at the Baltimore conflagration upon ferro-concrete. It is not with the object of decrying concrete or ferro-concrete that we publish these illustrations, but merely to elucidate an earlier argument of ours, and also to elucidate the valuable contribution by the well-known insurance surveyor, Mr. James Sheppard, A.I.E.E., in our first supplement as to the necessity of the metal-work in ferro-concrete (rods, wires or bars, as the case may be) being duly covered by a sufficient thickness of concrete to prevent its being affected by fire. In other words, we simply present these illustrations to indicate in what direction existing ferro-concrete systems must be improved in order to attain that quality of fire-resistance which is essential if the systems are to become popular in this country.

In France, the home of the ferro-concrete systems, fire prevention and fire-resisting qualities rarely receive due consideration, and it is only in the far future that we anticipate that that attention will be given to this aspect of constructional work by the public authorities of France.

But questions of fire prevention do receive consideration in this country, and it speaks well for the consideration of technical details on the part of the London County Council that floors of this type will be tabooed in the Metropolis if the metal-work is not protected by at least 2ins. of concrete, and this restriction will be one of the most beneficial factors of the proposed Building Act amendments when they become law. Metal-work everywhere will have to be protected in this manner, and this will include the metal-work in ferro-concrete floors.

Our illustrations are of the Fidelity and Guarantee Building of Baltimore. This building was a four-storey structure, comprising girders, posts and floors in armoured concrete; the bays of the floors span about 10ft. each. The lower portions of this building were uninjured, and the upper portions had to bear the brunt of a considerable amount of fire; it is thus from the upper floors that we present the illustrations.

Of course the Baltimore fire did not present anything that was new to those conversant with the subject in this country. It was generally well known that where metal-work was not properly protected in ferro-concrete floors, damage must be done.

The test on a Swiss concrete floor, and illustrated in our first "supplement," clearly showed what would happen if the metal-work was not properly protected. It is however, always interesting to have such illustrations as these herewith to prove a principle, taken from actual fires, and we trust that the lesson presented at Baltimore in such a forcible manner will at least convince the French ferro-concrete manufacturers who are opening up business in this country that it is futile to put their wires, bars and rods close to the soffit of the floors if they propose to make any considerable progress on British territory.

Given the due protection of 2ins., we see no reason why these ferro-concrete floors should not withstand a very considerable amount of fire and water, and they should, in fact, be able to attain classification as "full protective floors" under the testing standards. But the question of the protection of the metal-work is an essential one, and to attempt building floors where it is not so protected is puerile from the fire point of view.

It is to be hoped that the insurance companies, who have very great power in the direction of ware and dock property, will insist on this protection being afforded, and it is also to be hoped that some of the more progressive firms interested in the subject will boldly adopt the necessary policy of protecting steelwork and prove officially what we here indicate. We believe excellent results will be thereby obtainable.

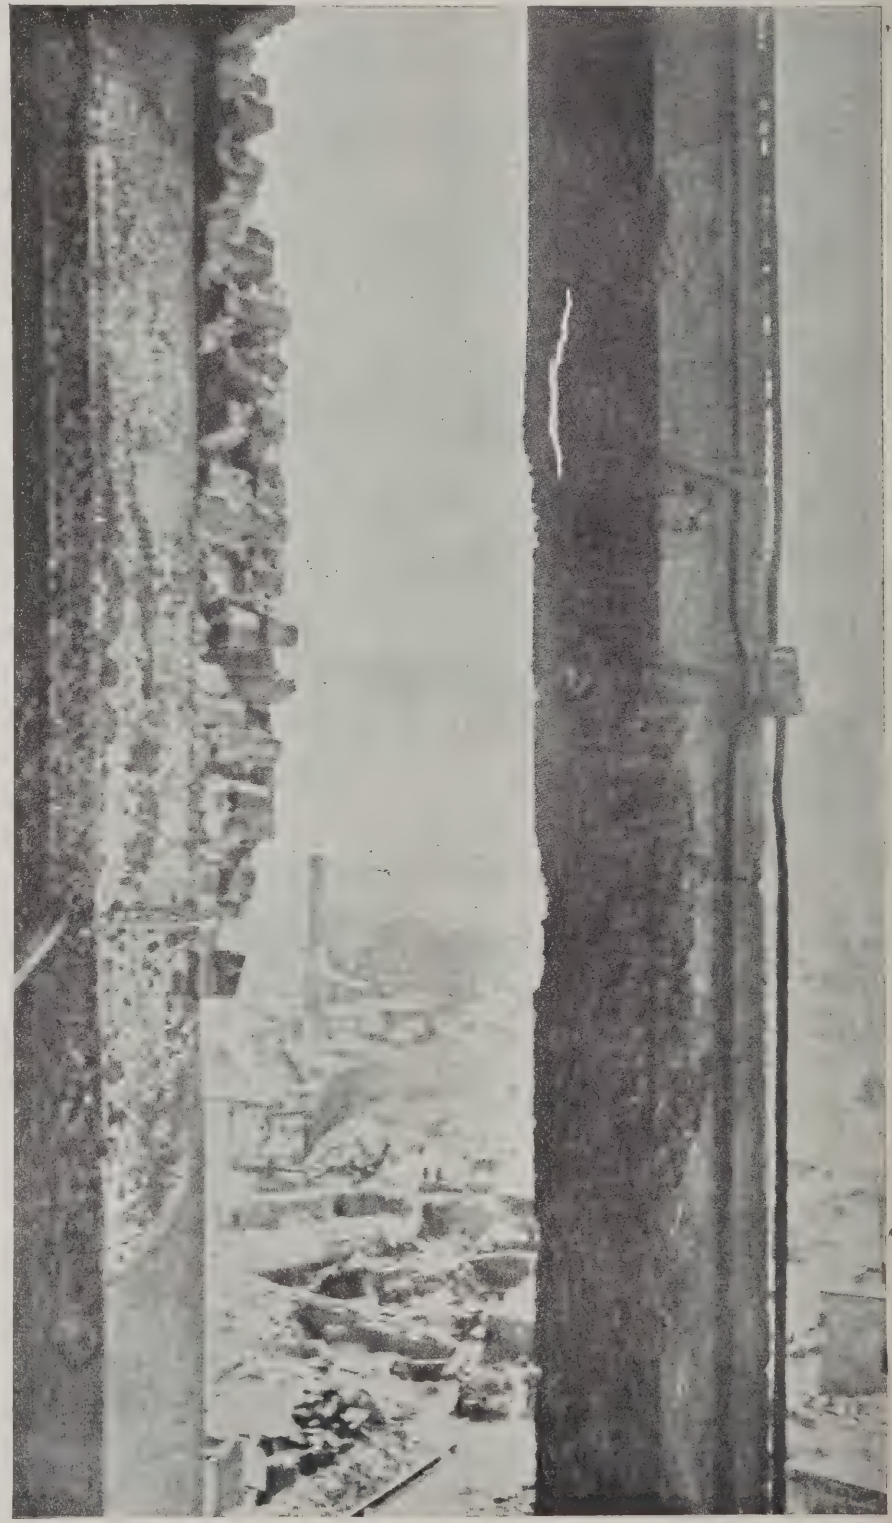
The National Fire Brigades Union had its annual Council meeting on the 24th February, when a considerable amount of useful business was transacted. Arrangements have been made by which the Union will hold its tournament in the Crystal Palace grounds some time in June. The Duke of Marlborough will preside at the Union's annual banquet, probably towards the end of this month.

FIRE TESTS.

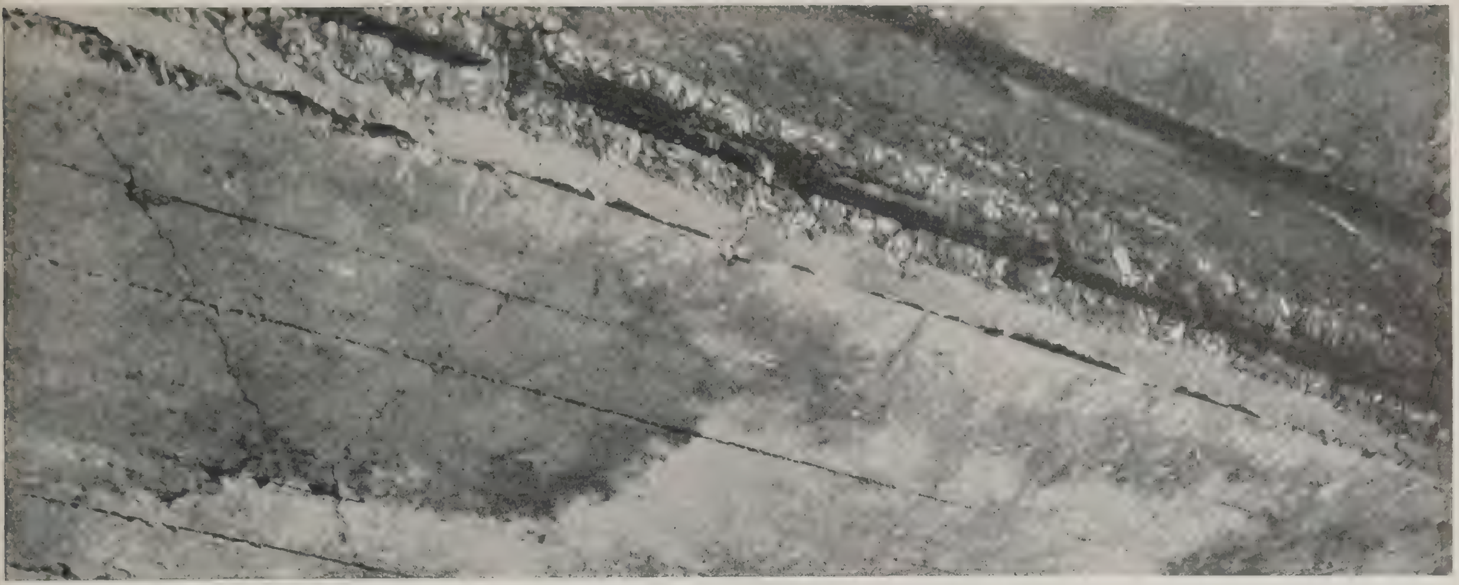
OFFICIAL REPORT ON ELECTRO-GLAZING.

IT is well known that electro-glazing affords considerable protection against fire, and we believe the British Luxfer Prism Syndicate were one of the first to avail themselves of the British Fire Prevention Committee's tests in 1899, to prove their *bonâ fides* and show that electro-glazing really did what they intended.

We believe that no less than three tests were undertaken at that time with casements and skylights having electro-glazing, and it was found that this method of glazing could be relied upon to withstand fire for quite half an hour. At that time both casements and skylights were tested in somewhat large dimensions, each sheet of electro-glazing, i



DETAIL OF FERRO-CONCRETE POST IN FIDELITY AND GUARANTEE BUILDING, BALTIMORE.



UNDERSIDE OF FOURTH-STOREY CEILING.

we recollect rightly, measuring about 4ft. by 3ft.

It has, however, been obvious to all interested in the subject that in order to insure greater efficiency, it is advisable to limit the size of each sheet of such glazing, so as to avoid bulging and buckling, and both the insurance companies recent rules, and the Building Act Amendments Bill, seem to indicate that the maximum superficial area of any one sheet for fire-resisting purposes should be 4ft. super., *i.e.*, that a window should be divided up into lights of not greater superficial area than 4ft.

The company has now tried, in a very progressive manner, to show what their glazing would do under these new and important conditions, and they have been rewarded for their spirited policy by getting through their test in a most remarkable manner, withstanding a very severe fire ranging up to and over 1,500 degs. Fahr., for as much as forty-five minutes, and in respect to none of the lights tested did the fire or smoke penetrate the glazing. Water from a steam fire engine was also applied through a $\frac{3}{4}$in. nozzle, and did not break down the glazing.

We print below the official "object" and "summary" of the report of the British Fire Prevention Committee, which has just been issued as Red Book No. 91, and is obtainable at the Committee's offices.

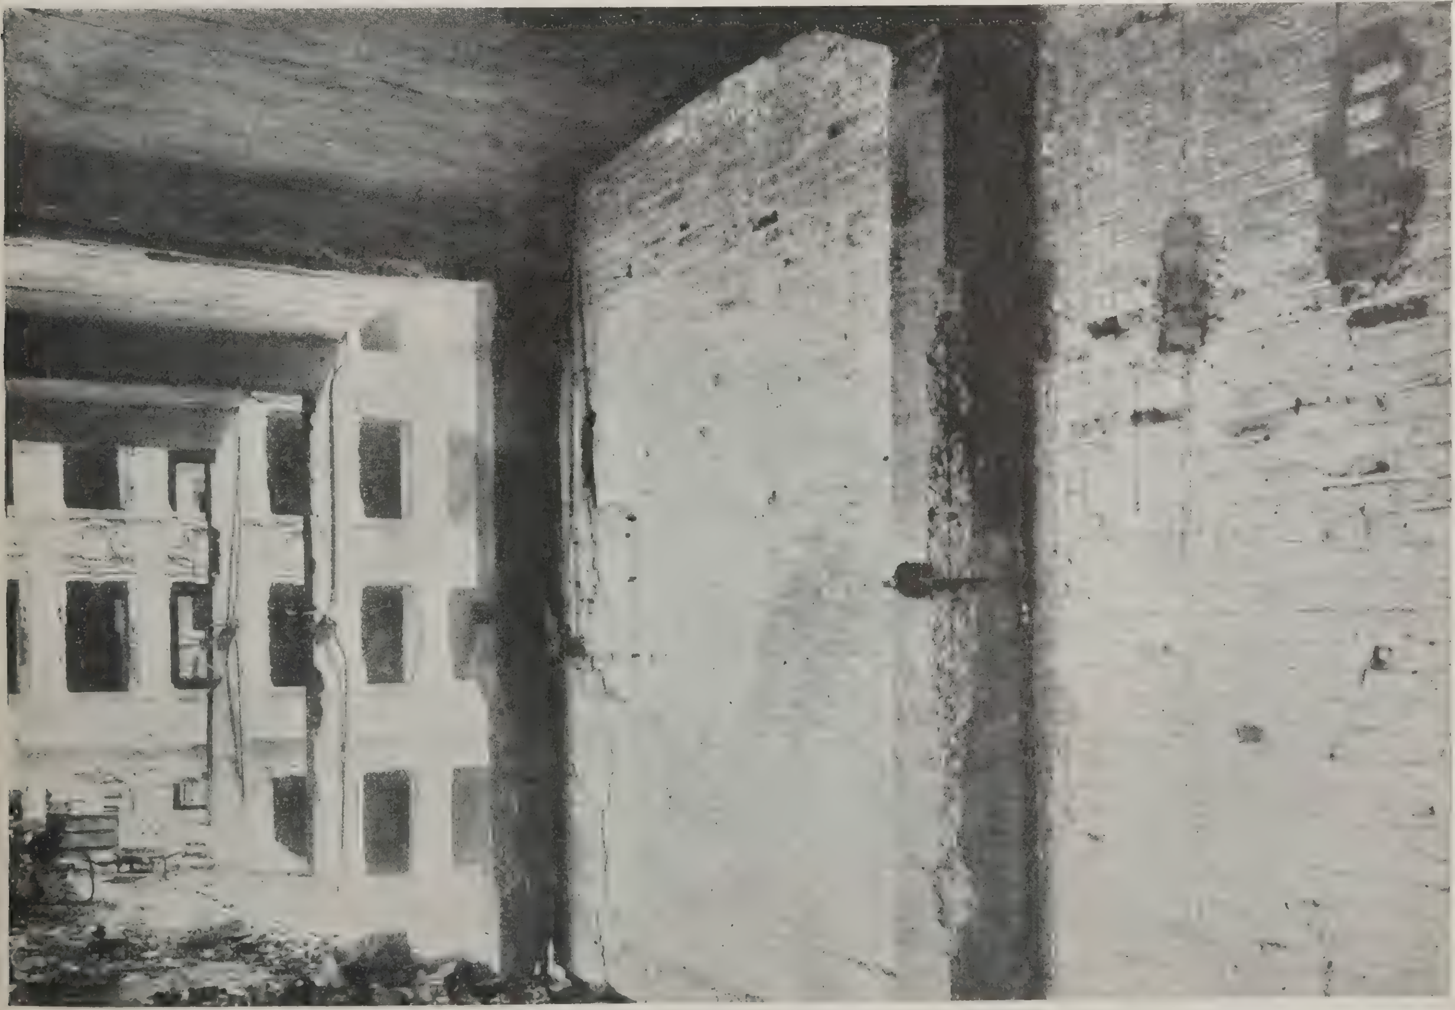
Object of Test.

To record the effect of a fire of three-quarters of an hour's duration at a temperature gradually increasing to 1,500 degs. Fahr. (815·5 degs. C.), but not to exceed 1,550 degs. Fahr. (843·3 C.), followed by the application of water for two minutes.

NOTE.—The lights, six in number, were to be in three pairs fitted in two teak frames and one steel frame respectively, each pair of lights being separated by transoms. The electro-glazing was to be partly in squares of 4in. by 4in. (·1016 m. by ·1016 m.), partly in diamond and fancy patterns.

Each light was to measure 2ft. by 2ft. (0·61 m. by 0·61 m.).

NOTE.—The frames are described as Nos. 1, 2 and 3; Nos. 1 and 3 being teak and No. 2 steel.



FERRO-CONCRETE COLUMNS IN FOURTH (OR TOP) STOREY OF FIDELITY AND GUARANTEE BUILDING, BALTIMORE.

Summary of Effect.

The squares of electro-glazing in each of the lights commenced to crack immediately after the gas was lit and other squares continued cracking during the test.

In fifteen minutes the glazing in the two teak frames commenced bulging, one (No. 1) towards the fire, and the other (No. 3) from the fire; this bulging increased during the test from ¼in. (·0063 m.) to ½in. (·0127 m.).

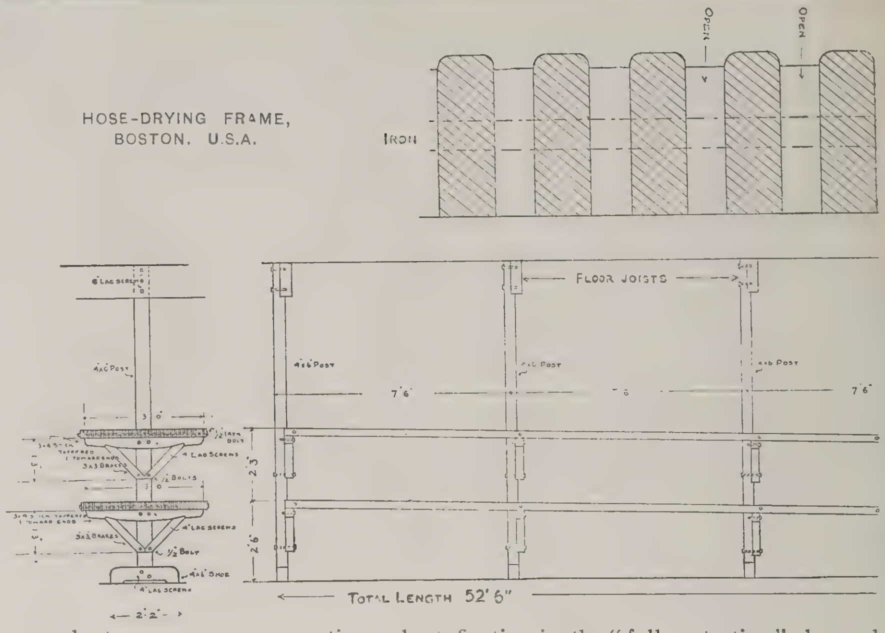
The teak frame (No. 1) which was set nearly flush on the fire side was burning freely; the burning subsequently decreased, but was renewed at twenty-one minutes. In forty minutes the teak transom of this frame was aglow on the side away from the fire.

The glass was not displaced from its electro-glazing in any of the lights.

On the application of water at forty-five minutes, the whole of the glazing was covered with small hair cracks, presenting a frosted appearance, but was not displaced.

There were indications that fire had passed between the glazing and the wood frames.

The fire did not pass through the glazing.



HOSE-DRYING FRAME, BOSTON. U.S.A.

AN AUTOMATIC FIRE-ALARM.

(B.F.P.C. Testing Operations of February 21st and 22nd.)

We understand that a test of considerable interest has been undertaken at the British Fire Prevention Committee's testing station with an automatic fire-alarm system by a Danish firm, which, it is anticipated, will overcome the grave defect at present existing in fire-alarm systems, namely, that of their frequently giving false alarms.

We understand the test extended over two afternoons, and on the second afternoon, the Committee were honoured by the presence of the Danish Minister, Mons. de Bille, accompanied by the Secretary of Legation and the Danish Consul, who witnessed the experiments that were being made with their countrymen's installation. It speaks highly for the interest accorded by Foreign Governments in the development of inventions by their citizens, that the Danish Minister should have attended this demonstration. We cannot recollect of ever having heard on any occasion that a British Minister, or even a Consul, has taken the trouble to attend an Englishman's demonstration of work in a foreign country, even on such great questions affecting our industries as the trial of ordnance and the like.

The tests, we have been given to understand, comprised a series of three laboratory tests, and three practical tests, supplemented by some general experiments. They took place on February 21st and 22nd, and there was a considerable attendance of representatives from public and municipal departments. It is anticipated that the official report will appear early in April. The system under review is known as the "Autopyrophon" of Copenhagen.

FIRE-RESISTING PARTITIONS AND WIRE GLASS.

(B.F.P.C. Testing Operations of March 8th.)

On Wednesday, March 8th, the British Fire Prevention Committee's testing station was the scene of a very important series of tests with proprietary articles, the Executive having arranged these tests to be undertaken as a series so as to enable the provincial members to attend and see a whole series of tests, who would scarcely make a special journey to town for witnessing a single test. This idea, which found a considerable favour with the provincial membership of the Committee, also had the great advantage of economy of time to those interested spectators who wished to just obtain an insight into the conduct of certain materials under fire and yet cannot afford the time to attend throughout the period of investigation. The tests, which commenced at 10.30 a.m., ran continuously until 6 p.m., but a visitor attending between 2 p.m. and 4 p.m. was able to see the ending of one important partition test, the whole of a test with wired glass and the commencement of a test with a thin partition, besides some experimental private tests with sprinklers and automatic alarms.

The first subject under official investigation on this occasion was a 3in. partition and a 9in. wall of asbestic bricks, manufactured by the Asbestic Brick and Tile Company, Ltd., who put these forward for a four hours' test in order to enable them to attain classification under the "full protective" class, which comprises a test of four hours of fire, ranging up to 1,800 degs. Fahr. and followed by the application of water from a steam fire engine for five minutes.

The second test was a test with wire glazing by Messrs. Pilkington Brothers, varieties of wired glazing, both polished and unpolished, being put forward for investigation, in various casements, the object being that these should attain the "temporary protective" class, which requires that they should stand a test of forty-five minutes up to 1,500 degs. Fahr., followed by the application of water for two minutes.

The third test was with a partition by the Adamant Co., measuring 2½ins. thick. This partition was also intended to obtain classification in the "full protective" class, which in the case of a partition of 2½ins. and under, means that it has to withstand a 2½ hours fire test up to at least 1,800 degs. Fahr. followed by the application of water for two minutes. It may thus be seen from the above that whilst the thicker partitions have to withstand fire for four hours, followed by the application of water for five minutes, the thinner one can obtain the same classification under less severe conditions, which practically means that a very substantial premium is set upon economy of space and a handicap on partitions that are not much thinner than ordinary brickwork.

These tests were attended by a stream of members coming from all parts of the country throughout the day, a number of Government departments and various official bodies were also represented during either the whole or part of the testing operations. During the afternoon, some private tests were also conducted with sprinkler heads with a view of showing how these tests were conducted by the Committee and in continuation of a series of tests with sprinkler heads which have been undertaken this session. The Danish fire alarm system referred to above was also under trial on continuation of some tests undertaken last month.

Amongst those present on this occasion were:—Mr. Redford, of the Home Office

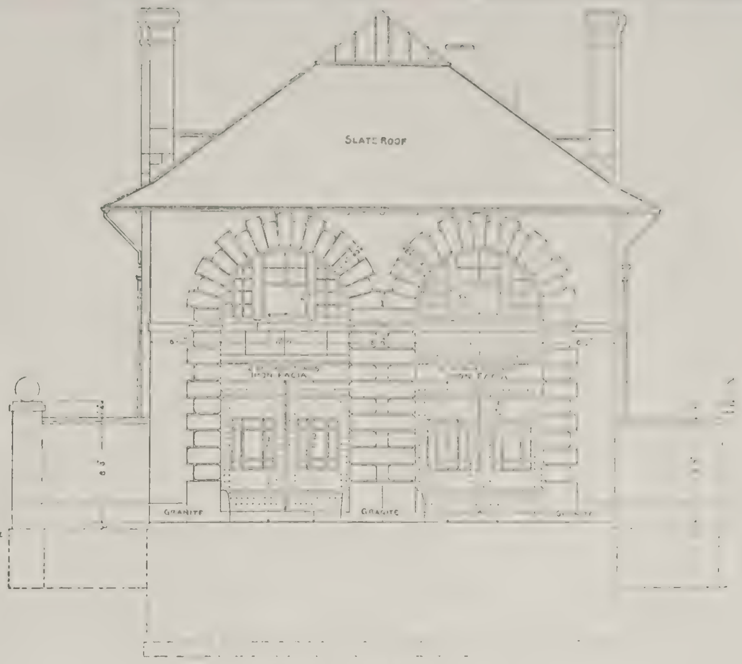
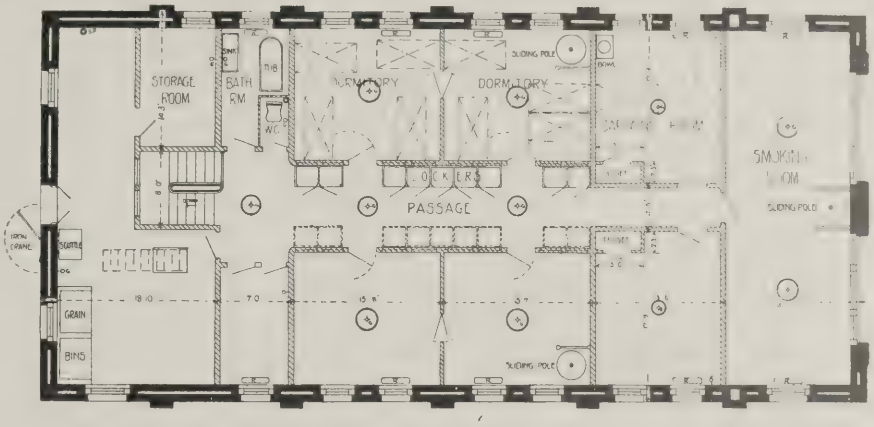
CROSS-SECTION.

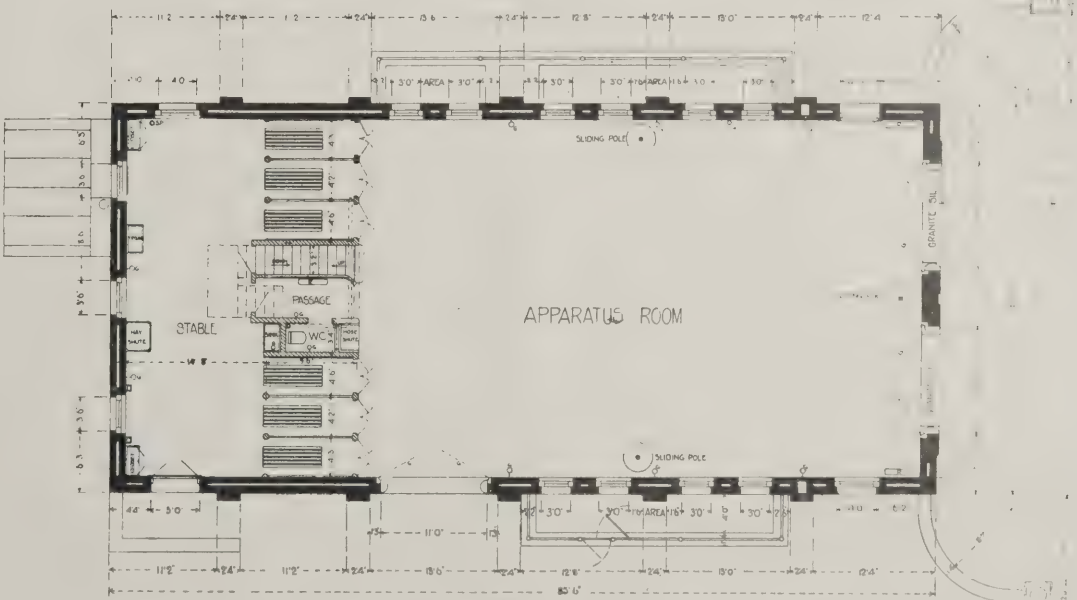


FRONT ELEVATION.

Factory Department; Mr. Gavey, C.B., of the General Post Office, accompanied by two assistant engineers; the engineer from H.M. Office of Works; the Danish Consul-General, and a number of officials from county councils, corporations and insurance companies.—The tests were conducted by special sub-committees, over which Mr. Dyer, Mr. Max Clarke and Mr. Marsland respectively presided; Mr. James Shepherd supervising the private tests.



SECOND FLOOR PLAN



FIRST FLOOR PLAN

WEST ROXBURG DISTRICT FIRE STATION, BOSTON, U.S.A. JOHN A. FOX, ARCHITECT.

DISTRICT FIRE STATION, BOSTON, U.S.A.

A CHARACTERISTIC feature of the American fire stations is the comparatively narrow frontage accorded them, and in many instances only one carriage door is available, through which the appliances are driven one after the other.

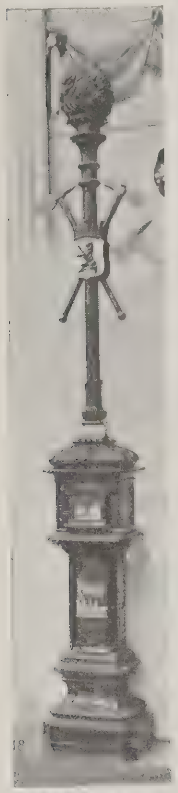
At Boston, U.S.A., the district station illustrated in this supplement, however, has two engine-house doorways, and the two appliances stand side by side, with plenty of space between them, the frontage of the building occupying 40ft. As a two-appliance station the example shown is a model one for American purposes, and the position of the main staircase, the stables and the three sliding poles should be specially noted. The bedrooms, smoking-room and offices on the first floor also claim attention on account of their compact arrangement and the excellent arrangement of the men's lockers.

As to the exterior, it has architectural pretensions, and suitably indicates the public character of the building. A detail claiming consideration is the hose-drying frame in the basement, which runs from front to back, whereby no hose tower is required. Mr. John A. Fox was the architect.

Chief Officer Giersberg, of the Berlin Royal Police Fire Brigade, died recently. "Engineering" says of him that he was well known throughout the continent of Europe and also in this country, which he twice visited. He was a primary mover in the evolution of the subject of fire protection in Germany and German-speaking countries, not, perhaps, so much owing to the introduction of modern appliances in his own brigade as by the organization of the very excellent Berlin Fire Exhibition of 1901 and the International Fire Congress of Berlin of that year. Of his writings, which are numerous, a volume dealing with the state of the fire service in Europe at the beginning of this century deserves particular prominence. He was a member of the International Fire Service Council, and an honorary member of both the British Fire Prevention Committee and the National Fire Brigades' Union. Chief Officer Giersberg had the opportunity of frequently being of service to Foreign Governments, and thus, besides a number of high distinctions, he was the recipient of numerous orders and medals from the Prussian and other German Governments; he held a number of distinctions from other countries.

A FOREIGN "FIRE-CALL POINT."

WE are illustrating a photograph of one of the new fire-call points which are being put up in Berlin, the introduction of which was one of the latest improvements brought about by the deceased fire chief, Giersberg. This fire-call point is certainly a most recognizable feature in the Berlin streets, and at night the light at the top is of sufficiently distinctive character as to be easily distinguished from the other lights common to public thoroughfares. These fire-call points are certainly a great improvement on the ugly standards generally to be found in this country, and we also think it is an improvement to attach the actual lamp standard to the call-point, instead of placing the call-point in proximity to a lamp-post. Seeing that red lamps are being constantly used for other purposes than the indication of fire-stations and fire-call points, there is certainly something very valuable in the idea of giving the light in question a peculiar shape and tint.



STREET FIRE-ALARM POSTS AT BERLIN.

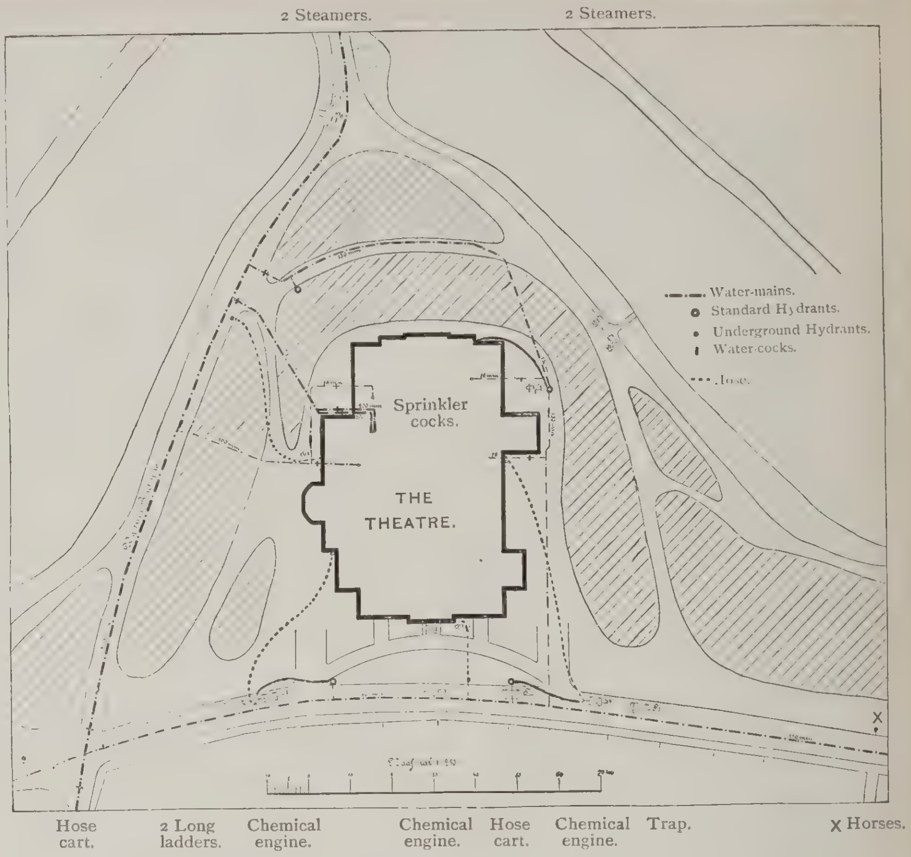
The detail of the design was from working drawings provided by the city architect of Berlin.

MODERN FIRE APPLIANCES AT PARIS.

IT has been our rule, as far as possible, to illustrate some modern fire appliance in each of our supplements, having regard to the fact that so many country architects and borough surveyors are nowadays either directly or indirectly associated with the fire service of the provinces. In this supplement we are illustrating an appliance from the Paris Fire Brigade which is a self-propelled chemical fire-engine. The Paris Fire Brigade, it should be added, is a military institution, known as the Fire Brigade Regiment, which is a unit of the army. Its principal technical officer is Major Cordier, who is primarily responsible for matters of equipment.

Mr. Pritchett, F.R.I.B.A., F.S.I., C.O. London Fire Brigade, has been accorded a seat on the Executive of the British Fire Prevention Committee. He was a member of the Special Fire Commission that visited Central Europe.

A Magazine's interest in Fire Protection.—The "National Review" of last month publishes an article on protection against fire, with particular reference to the irredeemable loss of historical buildings and historical relics, and the series of country-house fires that have been taking place during the last eighteen months. This increase is mainly ascribed to the wanton neglect or apathy of owners of country houses in matters of fire protection, and the fact that they do not realize their duty in retaining for the nation such highly important architectural and archæological monuments as these country houses are. It is indeed a sign of the times to find a first-class magazine taking up the subject seriously, and it is much to the credit of the editor to accord attention to the matter.

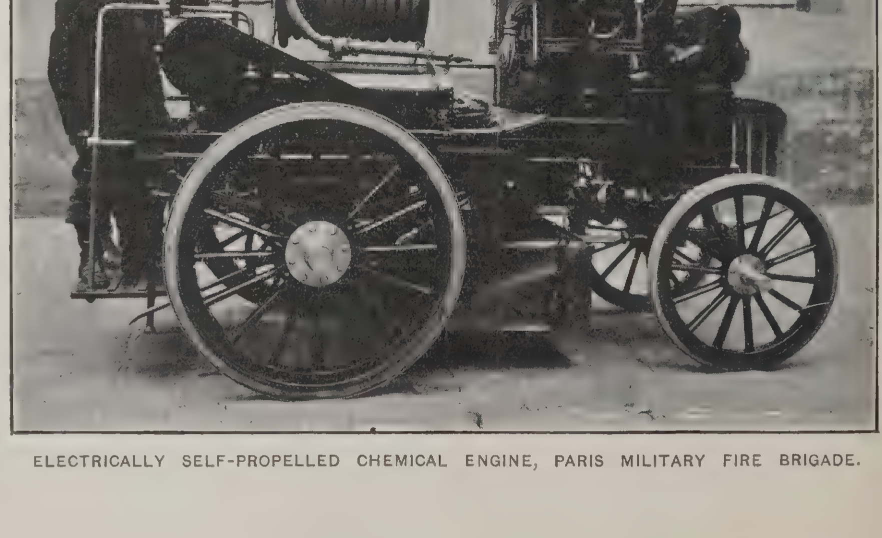


THEATRE SAFETY.

REVERTING to questions of theatre safety, we have always advocated that it is a matter of the utmost importance that fire brigades should be thoroughly conversant with the peculiarities of the theatres in their district. As a matter of fact, it would be well if the primary principles of how to deal with specific theatres in given areas were thought out and made subject to some kind of tactical exercise, as, for instance, the war game as played in the Army.

A step in this direction has been taken by Chief Officer Dittman, of Bremen, who has schemed out various methods of handling various kinds of fires that might occur at the principal theatres in his city; and as we think a plan indicating the possible tactics at a theatre fire to be well deserving of attention, we present, by his courtesy, one of the plans drawn out to serve as a general basis for a tactical or actual attack upon a fire that has arisen, together with the proposed concentration of the brigade in the earlier stages of the fire and the points of vantage in which the first arriving engines should be placed, the amount of hose required, &c.

It is noticeable that in the scheme presented the first steam fire engines are concentrated at the back, *i.e.*, stage side of the building, and the escapes in front of the main entrance.



ELECTRICALLY SELF-PROPELLED CHEMICAL ENGINE, PARIS MILITARY FIRE BRIGADE.

THE

BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD.

March 22, 1905. Vol. 21, No. 528. 6, Great New Street, Fetter Lane, E.C.

Summary.

Architects' assistants from twenty-four to thirty years of age are wanted for Chicago. (Page 157.)

The London Building Acts Amendment Bill has been dropped, with the exception of the fire clauses. (Page 158.)

Students of the modelling school at the Royal College of Art are to be allowed to submit sketches for four of the statues required on the South Kensington Museum extension. (Page 157.)

For the Ritz Hotel, Piccadilly, the drawings of the steelwork have been made with a view to reduce work and trouble in the shop and to dispense with template making, resulting in more accurate work and a better fit on the site than if the spacing of rivets were determined by the template maker in the shop. All standard pieces have a letter the same throughout the job, and this enables the mill to make thousands of pieces often in advance, consequently at reduced cost. The total number of drawings made has been 2,037; while the total amount of blue printing paper used is approximately 13,000 lin. ft., 30ins. wide. The number of drawings required shows that the system here adopted is expensive in the engineer's office, but it is evident that the clients can expect better work and money to be saved in the shop, and that the difficulties on the site will be reduced to a minimum. The whole structure is composed of the following approximate number of pieces:—5,200 beams, 550 columns and struts, 55 plate girders, 3 trusses, 4,000 cast-iron separators and 44,000 field rivets. (Page 148.)

A British embassy in a foreign capital is the subject set for the Royal Academy gold medal and travelling studentship in architecture. (Page 158.)

A new police-court and station has been built near the Tower Bridge from designs by Mr. Dixon Butler. (Page 158.)

The Rhodes Memorial is to be erected on the Groot Schuur estate. Watts's "Physical Energy" will form the central feature, with an architectural colonnade as background. (Page 158.)

The Birmingham Architectural Association has passed a resolution approving the principle of architects' registration. (Page 157.)

Mr. Alfred East asks for the consideration of landscape in the decorative painting of buildings. He claims that it can convey a sentiment as pure, as high and as noble as a composition of figures can do. (Page 156.)

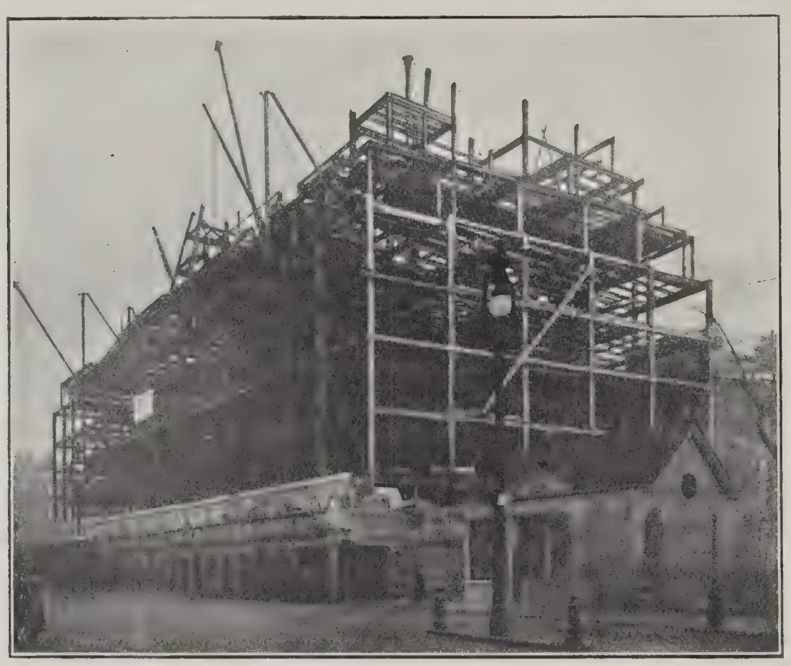
Royal Academy Exhibition, 1905.

The sending-in day for architectural works at the Royal Academy is Friday next, March 24th. We shall be glad to deliver drawings free of charge, but cannot undertake to receive them after 3 p.m. on the sending-in day.

Lady Tracers. At a recent dinner of the "Anciens élèves de l'Ecole" in Paris, M. Moyaux, who presided, took occasion to remind his hearers that two years ago, when he filled the same post, he had spoken somewhat jeeringly of the new proposal to admit young women to the architectural courses of the Ecoles des Beaux-Arts. He now confessed he had seen some young women who "handled the T-square and triangle as deftly as needle or crochet-hook and knew how to mix a batch of concrete with as full an understanding as if it were a matter of the domestic *pot-au-feu*," and he added that although the affluence of diploma-winning women was not at present very redoubtable, it might become so, since *la femme architecte aura pres du client des moyens persuasion autrement séduisants que ceux dont le sex fort peut disposer*—which truth holds good the world over, no doubt. The lady architect, however, is not without her disadvantages, and there is no likelihood of the profession being seriously invaded just yet. We suggest, meanwhile, that, following the lead of the Government drawing-offices, women might find ready employment as tracers for architects. Mr. James A. Smith, M.I.N.A., points out that it is common for them to be so employed in engineers' offices in the North; in fact, in some of the large Clyde shipbuilding yards women are employed not only to do the whole of the tracing of proposal, contract and working plans, but also to work out many of the intricate calculations of displacements, positions of metacentres, &c. Long experience has shown that the tracing can be neatly and reliably done by them, and the mechanical working out of calculation sheets is satisfactorily performed, the latter having, of course, all the multipliers, &c., printed in, and the ordinates, intervals, &c., filled in beforehand by the draughtsman in charge of the work. The immediate result of this is to free the draughtsman, and particularly the apprentice, from a vast amount of mechanical and uninteresting work. In architects' offices we have no doubt the same system could often be adopted with advantage.

Ownership of Drawings. The case of *Gibbon* v. *Pease*, and the recent discussion as regards the ownership of architectural drawings which arose out of it, has awakened interest in America. Our contemporary "The American Architect" remarks that as *Ebdy* v. *McGowan*, upon the lines of which the case was judged, is cited in American cases of the kind, it would be quite worth while for the American Institute of Architects to enquire whether the Royal Institute of British Architects, the Surveyors' Institution and the Society of Architects would not allow it, also, to contribute some of the sinews of war necessary to get a reversal of the decision. "But," our contemporary adds, "as the fight may be a long one, and as litigation is costly for defendant and plaintiff alike, it seems just possible that the defendant may offer, and the court force the acceptance of, some compromise before the case reaches the highest court. In such case, perhaps, for the sake of obtaining definite adjudication, it might be well for American money to be used in replenishing the defendant's account." If nothing comes of this appeal, English architects will at least feel happier in the conviction that they have the moral support of their American brethren. The average client takes far too much advantage of the architect and fails to understand that his experience, education and ability must be paid for directly, as he has not the means of securing it by the sale of goods. The Institute scale of fees is inadequate in many respects and needs to be revised, but, at any rate, this further injustice promises to be remedied.

"Specification, No. 8." The general character of "Specification" having been so carefully thought-out from the commencement, and its numerous sections so thoroughly compiled, it necessarily follows that each new issue cannot be materially different in appearance to those which have preceded it. On examination, however, the present issue will be found to embrace a number of new and important articles and a fresh collection of working drawings, while the several divisions into which the work is divided have all been carefully revised, brought up to date, and amplified where considered desirable. Among the new articles included in the volume is one on the planning of mine buildings—appealing particularly to Colonial readers; another on estate management; a very able article on reinforced concrete by Mr. Arthur T. Walmisley; another by Prof. Robert H. Smith on "Methods in Practical Calculation"; while the concluding part is given of Mr. Sloan's article on "The Construction of Arches, Vaults, &c." Mr. Walmisley, too, has rewritten the "Structural Engineer" section, dealing with the design of girders, roofs, arches, &c., in a way which enables architects to calculate for themselves, without relying on manufacturers' catalogues. The "Gasfitter" and "Painter and Decorator" sections have been revised by well-known authorities, and the "Electrician" section has been rewritten. In all there are more than seven hundred pages in the volume. As a technical authority for everyone connected with building it stands pre-eminent, and is wonderful value for half-a-crown.



RITZ HOTEL, PICCADILLY. *(Photograph taken on March 8th.)*

THE RITZ HOTEL.

We publish below some notes on the design of the steelwork for the Ritz Hotel, Piccadilly, London, W., contributed by Mr. Bylander, the engineer, who is responsible for this portion of the work. Mr. Bylander has had considerable experience in the design of steel-framed or skeleton buildings in the United States; and in view of the novelty of this method of building in this country, and the importance of English architects and contractors becoming conversant with the principles, the article should be studied carefully. We would particularly call attention to the great exactitude of the work, every dimension being figured on the drawings and nothing left to be scaled off; the elaborate nature and number of the drawings—this being no useless expense, because the drawing-office expenses form but a small percentage of the cost of the steel, and the German steelworks are thereby enabled to execute the work at a reduced price and without preparing templates, as is usual in English practice; and finally the careful way in which the details are standardized and facility of erection studied both to secure cheapness and to aid the execution being correct as designed.

NOTES ON THE STEELWORK.

By S. Bylander.

The Ritz Hotel is a steel-framed building, or so-called "cage construction," all loads, inclusive of exterior walls, being carried on beams and girders to columns and grillages.

Owing to heavy exterior back walls and limited site for foundations, relatively complicated foundations with cantilever girders had to be introduced. The construction practically conforms to the latest standards for steel-framed office buildings in America.

The hotel has its frontage to Piccadilly, and occupies the site between Green Park and Arlington Street. The length to Piccadilly is 231ft. 4½ins., to Arlington Street 115ft. 2¼ins., and to Green Park 87ft. 1⅛ins. The angle between building lines to Piccadilly and Arlington Street is 83° 3′ and to Piccadilly and Green Park 96° 36′ (as shown on the site plan published in our issue for November 2nd last, p. 238).

The area of the site is about 23,200 sq. ft. and the area of ground floor 22,000 sq. ft. The average area of each of the upper floors is about 19,000 sq. ft. The finished floor level of the ground floor of the hotel, which is called "hotel datum," is 1ft. 6ins. above the pavement level at the centre of the main entrance, and at building line to Piccadilly. The hotel datum or ground-floor level is 65·63ft. above British Ordnance datum. The basement floor is 22ft. 7½ins. below the ground-floor level. Part of the building has a mezzanine floor between basement and ground floors, and is called "lower ground floor." Above the ground floor there are seven floors.

On the Piccadilly and Green Park fronts the roof slopes at an angle of 75 degs., and extends from sixth floor to flat-roof level, which is 98ft. above "hotel datum." Owing to ancient light requirements the roof at Arlington Street was made sloping from fourth floor at an angle of 45 degs.

The front to Piccadilly has three pavilions, the highest point of them being 114ft. 6ins. above "hotel datum."

The cubical contents of the building is about 2,413,000 cub. ft. covered space.

The front walls facing Piccadilly, Arlington Street and Green Park will be of brick with stone or granite facing, the granite extending from the ground floor to the first-floor level.

The thicknesses of walls are according to the requirements of the London Building Act, being 39ins. thick at the street level and 14ins. at sixth-floor level.

In view of erecting the steelwork independently of brickwork or masonry, care has been taken in the design for bracing during erection. No columns or members subjected to great lateral strain have been made of cast-iron, and all steelwork is riveted. Great care has also been taken to protect the steelwork from corrosion or other deterioration, and to ensure the preservation and durability of all parts of the structure, by painting and covering with concrete, brick or terra-cotta.

As will be noticed on the column plan on pp. 290 and 291 of our issue for November 30th last, the columns have been placed in straight lines, and square with the building line to Piccadilly wherever possible and as far as the architectural requirements have allowed. Particular care has been taken to place them so as to allow for easy erection. The steel columns which carry floors and walls are supported at the basement level on cast-iron bases averaging 3ft. square and resting on steel grillages and concrete beds or footings. The concrete footings are 18ins. thick, and placed in pockets excavated in the clay about 5ft. 6ins. deep below basement

level, as indicated on the grillage plan published on pp. 236 and 237 of our issue for November 2nd last. The average size of grillages is 12ft. One of the large grillages is illustrated by Fig. 1 on this page.

In figuring the sizes of footings the dead load only has been considered, in order to secure uniform settlement, if any, and the following assumptions were made for figuring these:—

Weight of brickwork laid in cement-mortar - 120 lbs. per cub. ft.
Weight of granite - - 170 ,, ,,
,, stone - - 150 ,, ,,
,, floors, inclusive of steel - 100 ,, ,,
,, steel columns was calculated from the column schedule.

As the total dead load of floor only amounts to 80 lbs. to 90 lbs. per sq. ft., about 10 per cent.

RITZ HOTEL, PICCADILLY, LONDON: PORTION OF GROUND-FLOOR FRAMING PLAN.

B

RITZ HOTEL PICCADILLY: HOIST FOR MATERIALS ARRANGED IN WELL OF PASSENGER LIFT.

of the live load was included in figuring the floor load on the footings. This will allow for weight of terra-cotta partitions, pipes and ducts. The sizes of the footings have been calculated to the conservative figure of 5,000 lbs. per sq. ft.

The columns are figured for the full dead load and 80 per cent. of the live load. Girders and beams are figured for the full dead and live loads.

In calculating the stresses in the steel a factor of safety of 4 has been used.

The connections between beams and girders and between girders and columns have been made, as far as practicable, in proportion to the loads they have to carry.

With very few exceptions the connections are all riveted. The rivets are determined to carry the loads, and no beam is milled at the ends to fit the lower flange of the beam on which it is resting, as usual in English practice, but strong connections are used to keep the beams laterally supported and to transfer the loads centrally to the beams. The fibre stresses allowed are:—

16,000 lbs. per sq. in. for rolled beams and girders.
15,000 ,, ,, ,, ,, riveted works.
20,000 ,, ,, ,, ,, bearing for rivets.
10,000 ,, ,, ,, ,, shear ,, ,,

All beams in the grillages are braced and kept at the right distance apart by $\frac{3}{4}$in. thick cast-iron separators, and tied together with $\frac{3}{4}$in. diameter bolts. After the first tier of beams was set, concrete was filled between them, after which the second tier of beams was set on top of the lower tier and filled in with concrete in the same manner as the lower tier. The cast-iron bases were carefully levelled on top of the grillages with narrow shims or iron wedges and enclosed by clay dams. The space between the base and the grillage beams, about $\frac{3}{4}$in., was then filled in with cement-grout through holes in the cast-iron bases. The columns were set on their bases 6ins. below the finished floor level, and the concreting was then completed. The bases are, in general, 3ft. square on plan at the bottom. The top and bottom plates are generally $1\frac{3}{4}$ins. thick, reinforced with vertical transverse and diagonal ribs $1\frac{1}{2}$ins. thick.

The wall columns adjoining Lord Wimborne's house had to be supported on cantilever girders in order to keep the grillages inside the building line. The cantilever girders are nine in number, with triple web plates, the average depth being 3ft. and the width of flange plates 2ft. 6ins. The heaviest cantilever weighs 11 tons.

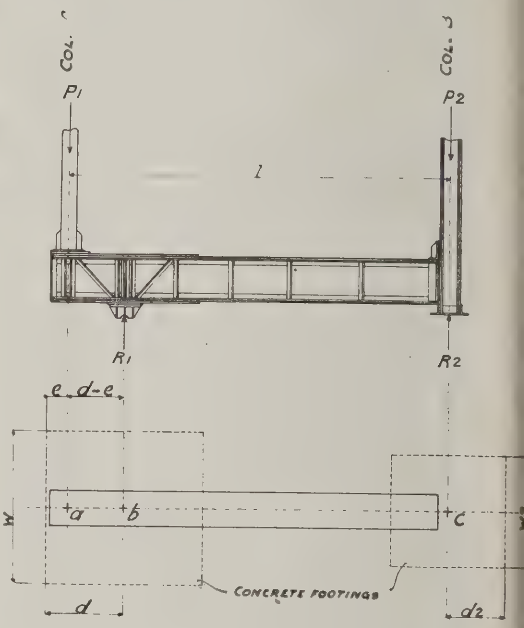

FIG. 2.—CANTILEVER FOUNDATION GIRDER.

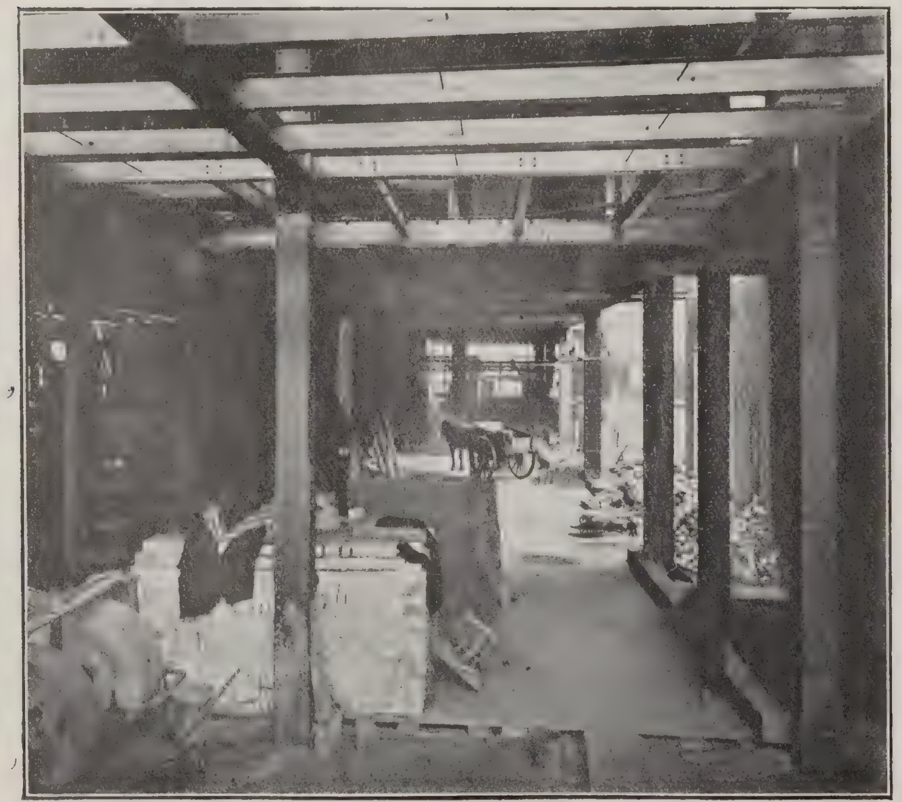

RITZ HOTEL, PICCADILLY: INTERIOR VIEW ON GROUND FLOOR. *(March 8th.)*

The following is an example of calculations for cantilever girders:—

Loads are given in tons and lengths in inches.

a = centre of column A.
b = ,, steel base and grillage.
c = ,, column B.
P_1 = load from column A in tons.
P_2 = ,, ,, ,, B in tons.
R_1 = load on grillage at B in tons.
R_2 = ,, ,, ,, C in tons.
w = assumed maximum practicable width of grillage at B.
d = half the length of grillage at B, or distance from building line to centre of grillage.
w_2 = width of grillage at C.
d_2 = half the length of grillage at C.

When "w" is assumed the value of d can be obtained from the following calculation:—

(1) . . . $R_1 = \frac{2dwp}{144}$ = load on grillage at a. As the algebraic sums of the moments around c, taken as moment point, it is found—

(2) . . . $R_1 \times (l-(d-e)) - P_1 l = 0$;

$$R_1 = \frac{P_1 l}{l + e - d};$$

and substituting R_1 in formula (1)

$$\frac{P_1 l}{l + e - d} = \frac{2dwp}{144},$$

$$144P_1 l = 2dwp(l + e - d);$$

$$dl + dc - d^2 = \frac{144P_1 l}{2wp};$$

$$d^2 - d(e + l) - \frac{144P_1 l}{2wp} = 0.$$

The value of d is—

$$(3) \quad . \quad . \quad d = \frac{e + l}{2} \pm \sqrt{\left(\frac{e+l}{2}\right)^2 - \frac{144P_1 l}{2wp}}.$$

By examining this formula it will be seen that d has two positive values, and it looks as if both values were possible; but as no consideration has been paid to the size of grillage at c, nor the value of P_2, it will be easily found that only the smaller value of d obtained by using minus is practicable.

As the value under the root sign must be positive, it will be found that the minimum value of w according to equation (3) is

$$w \geqq \frac{144P_1 l}{2p\left(\frac{e + l}{2}\right)^2}.$$

For this value of w, d will be equal to $\frac{e + l}{2}$, and this is possible only when the two columns have a common grillage and $P_1 = P_2$.

The maximum practical value of d in the case of cantilever construction, as can be seen from Fig. 2, is $d \leqq \frac{e + l}{2} - d_2$.

Having found d, the value of R_1 is obtained from (1).

As the algebraical sum of forces acting upon the girder (in this case they are all vertical) must be zero, we can write:—

$$P_1 + P_2 - R_1 - R_2 = 0.$$

$$R_2 = R_1 - P_1 - P_2.$$

The area of grillage under B is

$$= \frac{P_2 - R_2}{p} = 2d_2 \times w_2,$$

should $P_2 - R_2$ be negative, which it would be if $P_2 = 0$, or no column B were in existence. Such a case can be seen on grillage plan of the Ritz Hotel on pp. 236 and 237 of our issue for November 2nd last, the tail end of the cantilever girder supporting column 75 having to be fixed to and anchored down by means of a cross girder.

The area of grillage at a is $= 2dw$.

The maximum bending moment on the cantilever girder is—

$$M_{b\,max.} = P_1 \times (d - e) \text{ tons-inches},$$

$$\text{Sheer}_{max.} = P_1 \text{ tons},$$

and the section of girder can now be determinated from above.

The wall-plates on the cantilever girders are reinforced with plates and angles to take up the shear and transmit the load from column to cast-steel supports on the grillage. The flanges consist of 4 angles 6ins. by 6ins. by $\frac{5}{8}$in., and are reinforced with cover-plates of different lengths. The rivets used are $\frac{7}{8}$in. in diameter and placed ziz-zag; two rows in each leg of the angles. On top of the cover-plates the cantilever girder has a plate $\frac{3}{4}$in. thick, with countersunk rivets, and afterwards planed so as to give good bearing for the column, which is field-riveted to the girder. The tail end of the cantilever girder is field-riveted to the flange of the column to a plate riveted on the column sufficiently large and strong to transfer, by means of $\frac{3}{4}$in. rivets and stiffener angles, the force necessary to keep the cantilever girder in position.

The columns are of the closed cross-section type, consisting of two 12in. channels and 14ins. wide cover-plates, except on the upper floors, where, the loads being less, two 12in. channels, latticed, have been used.

The columns have been figured for concentrated and eccentric loads. Columns with very small eccentric loads have been considered as concentric loaded, and a fibre-stress of 12,000 lbs. per sq. in. has been used, when $l : r$ is less than 90. For eccentric loaded columns a maximum combined stress of bending and compression of 14,000 lbs per sq. in. has been allowed.

The outside dimensions of columns have been kept practically constant, and the cross-section has been changed by using materials

FIG. 5.

(channels and plates) of different thicknesses. By this method fifteen different sections were adopted.

Maximum sectional area = 92·5 sq. ins.
Minimum do. do. = 13·3 „ „

Where very heavy loads had to be carried the section was strengthened by adding reinforcing plates riveted to back of channels (see column schedule published in our issue for November 30th last). The heaviest columns in the building are those which carry the heavy plate girders at the second-floor level. The numbers of these columns are 59, 61, 63 and 65 (see column plan, November 30th). These plate girders are supporting the columns 60, 62, 64, which start at the same level. The columns 59, 61, 63 and 65 are built up of three channels 12ins. by 40 lbs. per ft., four cover-plates 19¾ins. by ⅞in., and six reinforcing plates 9ins. by ¾in. (or for the lighter section three reinforcing plates 9ins. by ⅜in.). The sectional area of the heaviest column section is 142 sq. ins. Above the second floor the sections are reduced to the 2-channel type. All columns are made in two-storey lengths and spliced at a distance of about 1ft. 6ins. above the floor-level, their sections being changed at each splice to correspond with the loads they are intended to carry. Both ends of the columns are milled, and in the splice is placed a cap-plate or horizontal diaphragm of exact dimensions, bolted to the columns with angles. This cap-plate gives a good bearing for the column above. The upper section is secured to the lower one by field-riveted vertical splice-plates.

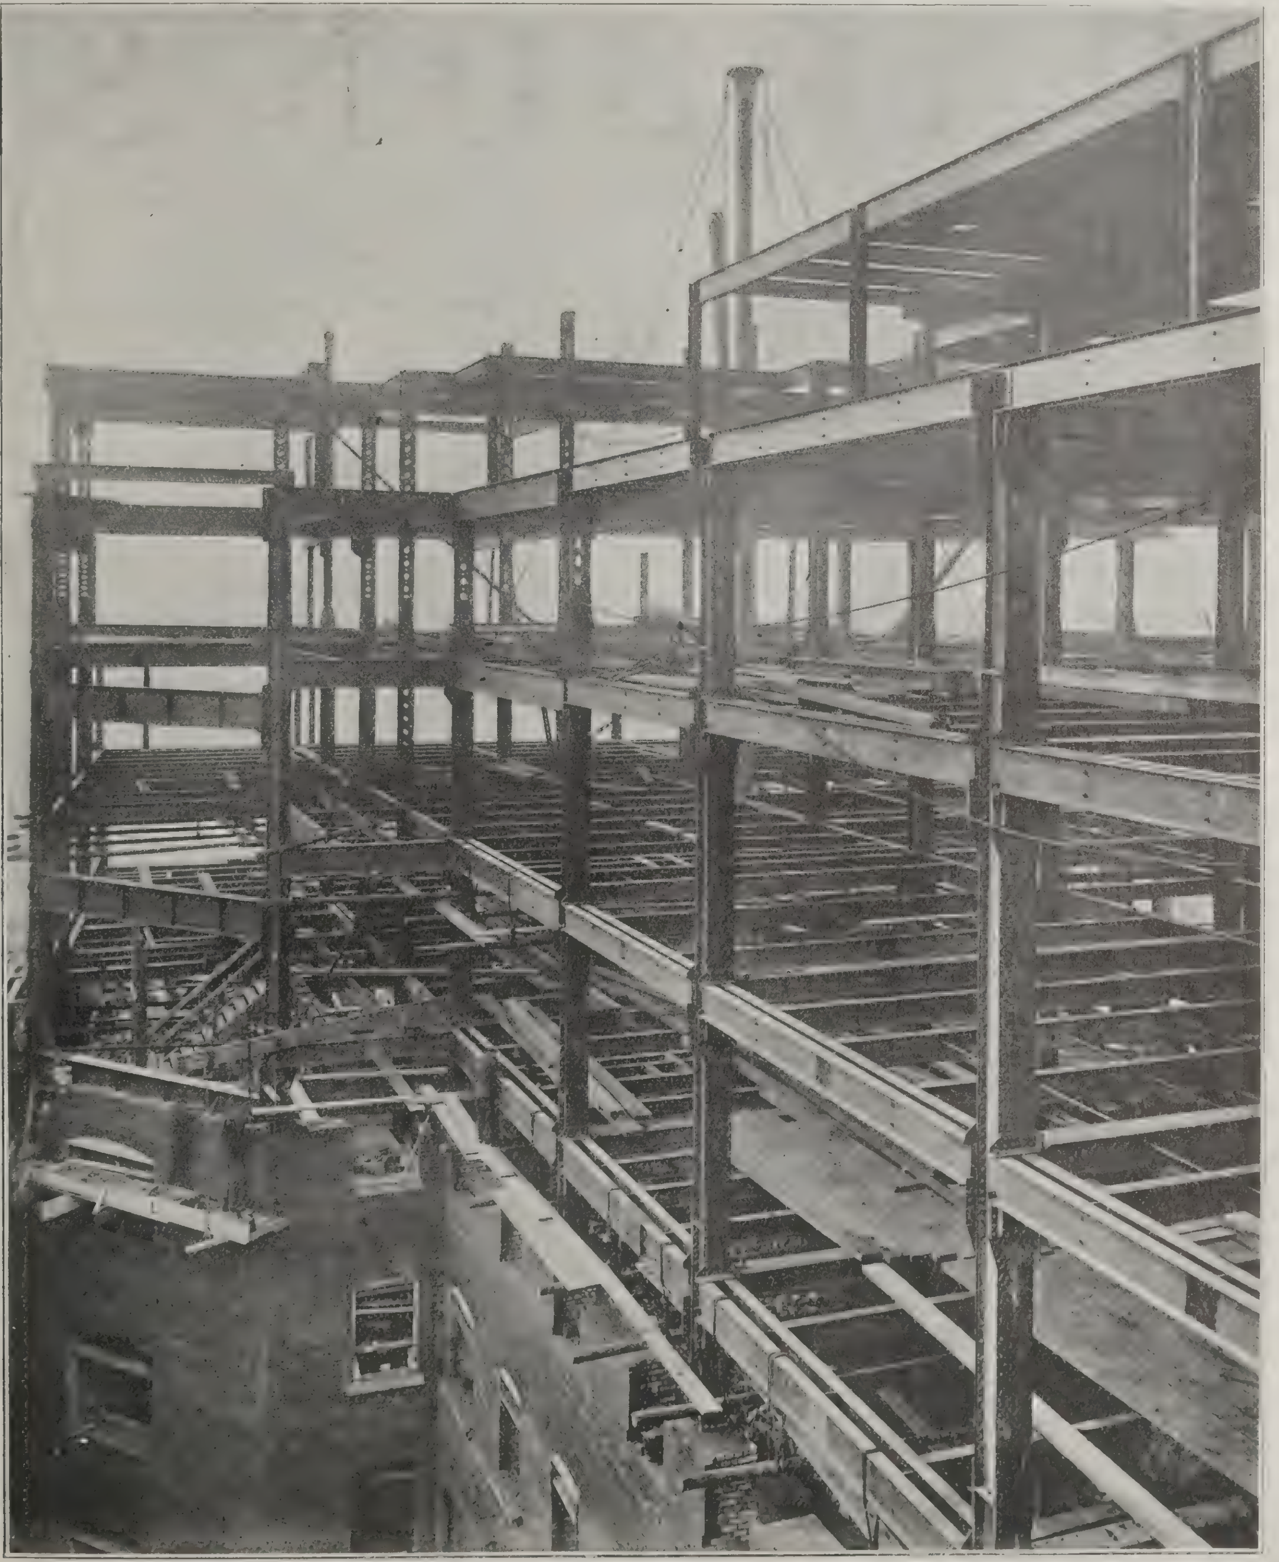
The beams are connected to columns with top and bottom angles shop-riveted to the column, the seat angles being supported by stiffener angles.

A principal shop-detail drawing of a column is shown by Fig. 3 on p. 151 of this issue, from which it will be seen that all dimensions are given and all views shown. The different pieces are marked with reference letters to the bill of materials, which gives sections and lengths of the different parts of which the column is composed. The drawing is made with a view to reduce work and trouble in the shop and dispense with template making. The result will be more accurate work and a better fit on the site than if the spacing of rivets were determined by the template maker in the shop.

All standard pieces have a letter the same throughout the job and this enables the mill to make thousands of pieces often in advance, consequently at reduced cost.

Beams have been placed 1,600, 1,400 and 1,200 millimetres apart, wherever practicable (1,600 millimetres = about 5ft. 6ins.).

The arrangement of dimensioning and marking can be seen on the framing plans reproduced in this issue. The numbering of beams has been made in such a manner that



RITZ HOTEL, PICCADILLY, LONDON: VIEW OF STEELWORK FROM FOURTH FLOOR, LOOKING TOWARDS GREEN PARK.

B¯4

it will be easy for the erectors to find the beams, namely, the number of a beam divided by 10 with the decimal neglected is the number of the column in the same panel, as, for example, the beam numbered 43 is in the same panel as column 4. Beams in different floors have always the same numbers as the beams below.

Standard connections and brackets have been used wherever possible, and the load is figured to be be carried by rivets only in the connection.

Coped beams do not rest with their webs on the girder flange, the cope always being made to clear the girder flange with $\frac{1}{4}$in. It has been specified that the variation in length for the rolled and cut beams shall not exceed $\frac{3}{8}$in. Dimensions over angles and distances between holes have been made accurate within $\frac{1}{16}$in. Principal shop drawings for beams are shown on p. 152 of this issue.

It may be of interest to mention here a few particulars in regard to the number of drawings made for the steelwork and also some figures showing the number of steel pieces, such as columns, beams and separators, as below.

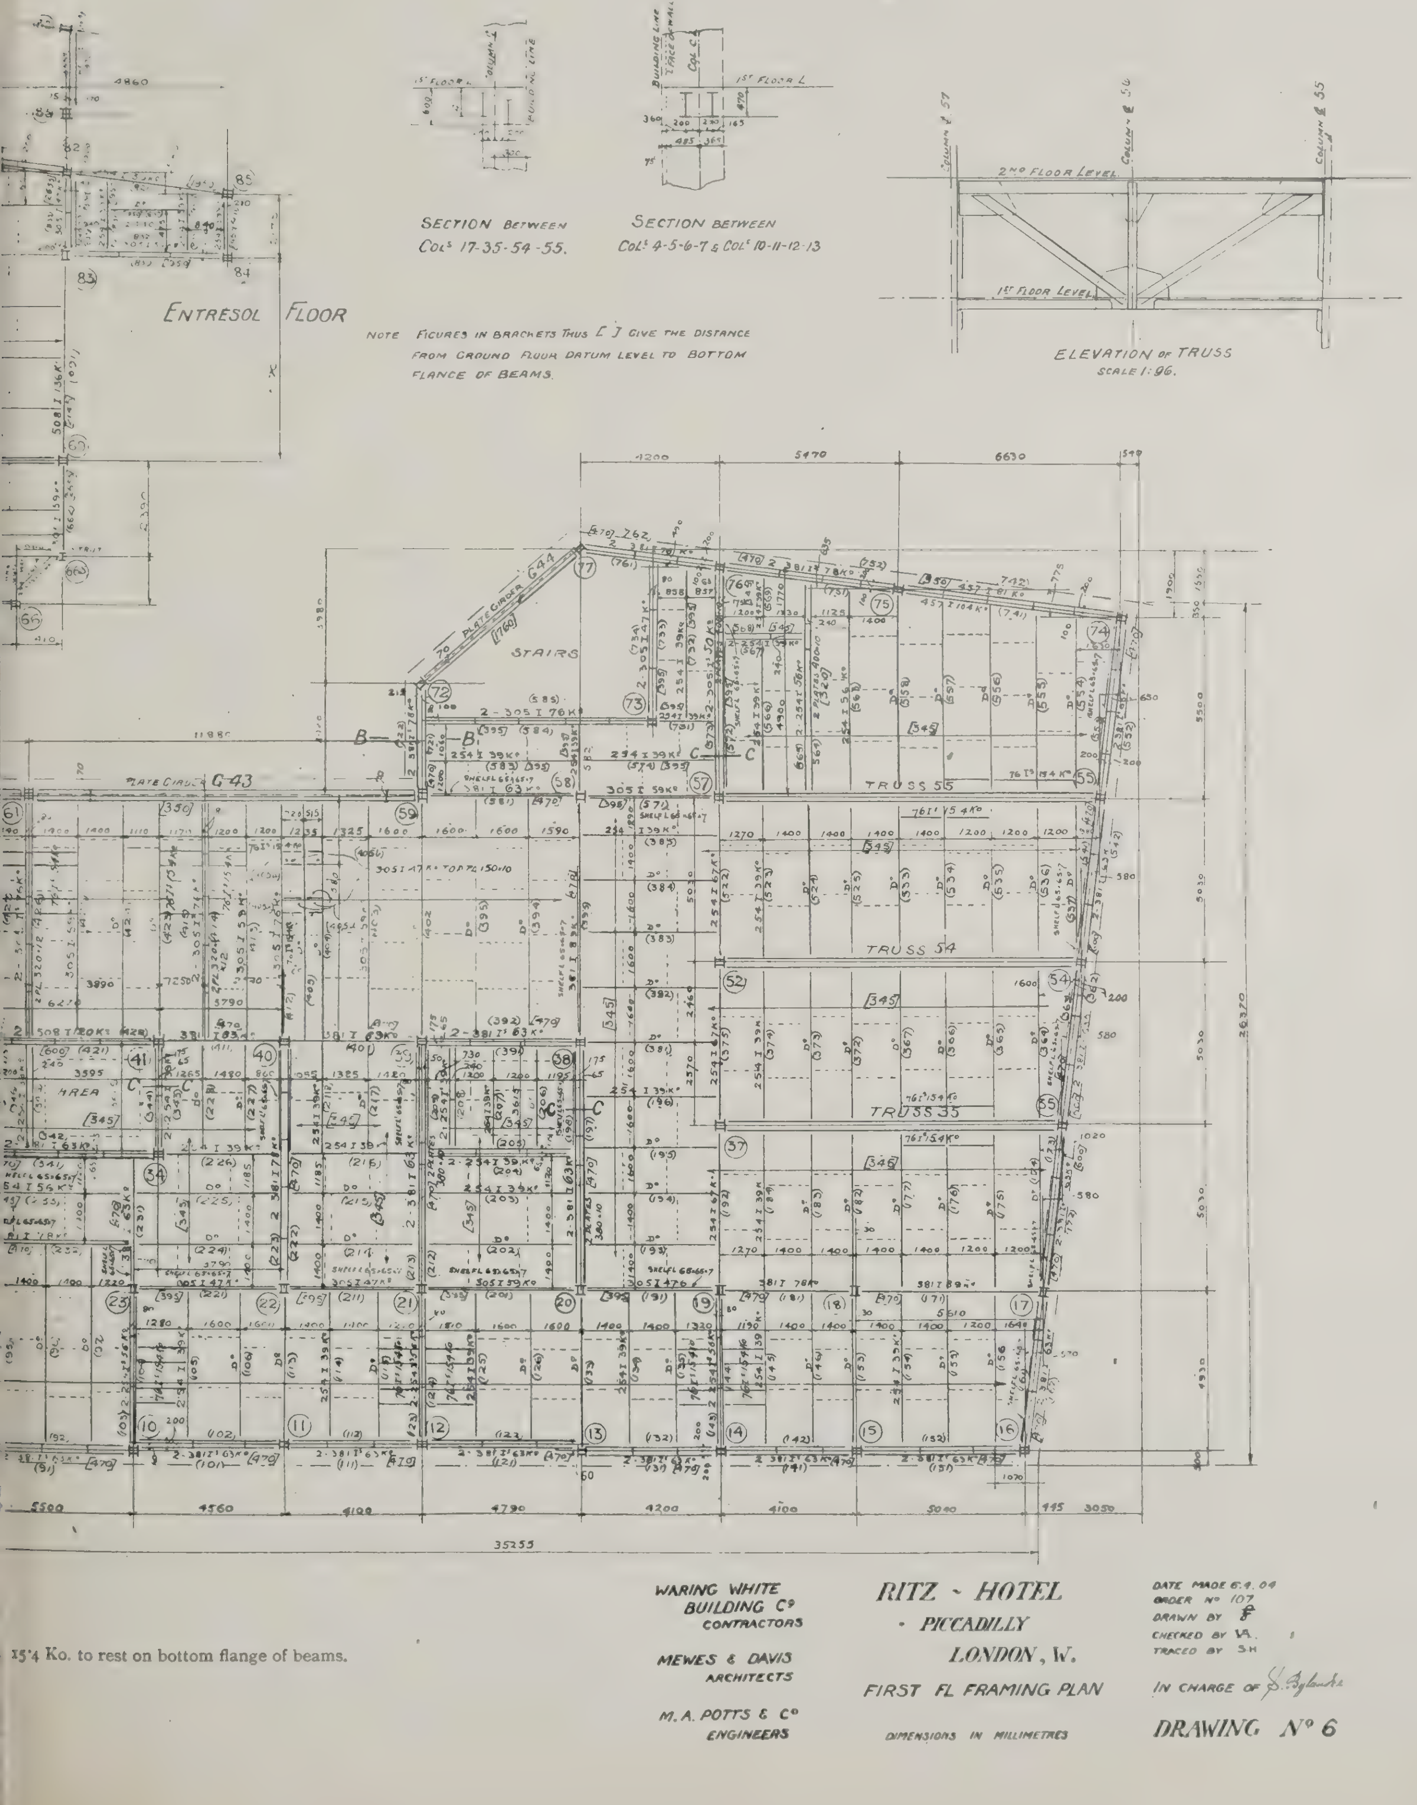
Total number of drawings		2,037

The total amount of blue printing paper used has been approximately 13,000 lin. ft., 30ins. wide.

The number of drawings required shows that the system here adopted is expensive in the engineer's office, but it is evident that the clients can expect better work and money to be saved in the shop, and that the difficulties on the site will be reduced to a minimum; thus on the whole saving them considerably more money than the extra cost involved in the drawings by the adoption of this thorough system.

The whole structure is composed of the following approximate number of pieces as named below:—

Beams	5,200
Columns and struts	550
Plate girders	55
Trusses	3
Cast-iron separators	4,000
Field rivets	44,000



15'4 Ko. to rest on bottom flange of beams.

The Present Condition of the Building.

The general photographic view on p. 148 shows the condition of the building on March 8th, on which date all the other photographs published in this issue were also taken. In studying the progress of this job it should be borne in mind that the contractors, the Waring White Building Co., Ltd., were delayed about six weeks during November and December owing to the slowness of the German mills in fabricating the steel and poor deliveries by rail and steamer, in addition to other unforeseen contingencies, such as fog, low tide, &c. Most of the steel is now in position and all of it is on the site. The American derricks are a distinguishing feature of the general views; there are four derricks used for handling stone, three for handling steel (only one of which is of American type) and one 5-ton hand-crane also for the steel. There are, in addition, hoists in four of the five areas, for taking up material, one of which we illustrate on p. 150 of this issue, which at the same time shows the iron barrows used on the job. The granite which goes to the first floor is now practically complete, and the Portland stone for the rest of the front will be rising soon. The Columbian Fireproofing Co. has made great progress with the floors, and the interior brickwork is proceeding apace. The steel chimney stack from the boilers illustrated on p. 148 is secured to the steel frame with a proper arrangement made for expansion; it is lined with 4½ins. of firebrick, with an air-space between that and the metal. Among other obvious points of interest in the photographic view on p. 153 we may call attention to the kind of painters' light scaffolding suspended from the steelwork for the use of the bricklayers, who are shown at work. The architects of the hotel are Messrs. Mewes & Davis & John P. Bishop, A.R.I.B.A., of 25, Dover Street, London, W.

R.I.B.A.

Decorative Painting.

A MEETING of the Royal Institute of British Architects was held on Monday evening at 9, Conduit Street, W., the chair being occupied by the president, Mr. John Belcher, A.R.A.

The decease of Mr. Charles Bennett Arding, Associate, and Prof. Ludwig Peter Fenger, Hon. Corresponding Member, of Copenhagen, was announced.

Papers on "Decorative Painting" were then read by Sir William Richmond, R.A., Mr. Alfred East, A.R.A., and Mr. Solomon J. Solomon, R.A.

Sir William Richmond's Paper.

Sir William Richmond in his opening remarks referred to the ties which united the arts of architecture, sculpture and painting. The votaries of architecture were builders who designed and erected, sculptors who designed and carved, painters who enlivened its severe spaces with the glory of colour, craftsmen who brought glitter and sunlight into its darkest nooks as rays of light into a cavern. Late in history, architecture had wished to go alone. Hence arose the danger that ornament might be stereotyped and of trade manufacture, painting cease to add its magical charm, and sculpture be relegated to an independent and solitary mission.

Coming to the special branch of the arts he was to discuss—viz., Decoration, which included mosaic and mural decoration—the author said he feared that the delightful method of "buon fresco" was for the present an impossible one to pursue in London owing to the vitiated atmosphere produced by disintegrating acids which were destructive to lime; but in the country, where pure air was obtainable, "buon fresco" might be adopted for interiors with as much security as in Italy in times past. Provided there was no poison in the atmosphere, damp was the only enemy to fresco.

Mosaic is adaptable to exteriors as to interiors, but to be effective mosaic must be used lavishly. But mosaic demands another kind of design and drawing from any other material for decoration. The translation of pictures into cubes is absurd. Mosaic can do what no other method is capable of, but it cannot imitate excepting inadequately. The design must be clear, the drawing severe, the accidents few, the light and shadow rare. An architect should build for mosaic decoration if he intends to use it. He should give plenty of domes, semi-domes, alcoves, because mosaic looks best upon curved surfaces, where it is least likely to come into competition with pictorial design. A building to receive mosaic should have few mouldings or frames; the framing of mosaic pictures should be executed in mosaic, and string-courses as well as mouldings should be so designed as to be in harmony with the style which is essential to mosaic, and that is severe. The architect must consider his decoration while he is initiating the plan for his enterprise as well as the elevation. In a well-built mosaic the construction is never hidden or the joints concealed. The mosaics that look best from a distance have a good wide joint between every cube.

The next best method for wall decoration to "buon fresco" is tempera painting upon a dry wall of lime and marble dust. The tempera used is the yolk of egg only, not the white. When dry this becomes as hard as the hardest varnish. The yellow tint gives a very agreeable tone to the white lime. Almost all colours can be used with egg. Egg painting has stood the test of time; many of the wall-paintings at Pompeii are in egg alone, and all the tempera pictures and wall-paintings in Italy which are not fresco or wax are painted with egg tempera.

Wax painting is another method well suited to our climate. The method, technical details of which were given by the author, may be seen in the National Gallery exemplified by portraits on wood of the second century B.C., and in many of the wall-paintings at Pompeii and Herculaneum. The author said he had tested some Egyptian wall-paintings and found that they were executed in wax and spirit. Wax-painting is perfectly durable on a wall, but not on canvas. In England it would be advisable to burn the wax well into the wall with artificial heat.

Oil-painting should be entirely abjured in decoration.

All decoration should be done upon the wall, where it is subjected to environment, and not be applied. Notwithstanding personal discomfort, painters should execute their works *in situ*—even in a dark corner, because that dark corner is the place of the picture, which if painted in full light of a studio will be quite disappointing when it is placed in an obscure light. The same law of fitness holds good as regards sculpture. A statue designed to be set in a niche should belong to it and to nowhere else—more, it not only belongs to its immediate but to its less immediate surroundings also, and is out of place away from there.

Mr. Alfred East's Paper.

Mr. Alfred East, A.R.A., took for his branch of the subject "Landscape Painting as a Medium of Decoration," and showed that it had been almost ignored as a mediun of decoration. The architect, like the figure-painter, had kept it strictly in the background. The architect may desire a certain colour arrangement to complete the object he has in view; he never thinks that he can find what he wants in landscape. He has the right to demand certain conditions as to scale. To accept those conditions, to work within them so that there is no apparent effort in so doing, is in itself an artistic accomplishment. The architect has no reason to fear that in the adoption of landscape he endangers any of these principles; he may find in such decoration the sentiment of his architecture, the purpose of its being. If he has built a place of worship there is absolutely no reason why the walls or windows should illustrate the lives of the saints. There are things in nature which suggest a lofty purpose in their creation, and which reveal the high purpose of the creator. There are also the materials in nature by which the artist can convey a sentiment as pure, as high and as noble as a composition of figures could do. An architect would not tolerate any loud assertiveness of decoration whose anecdote completely distracted the attention of the spectator from the fine proportion of his building. He contended that his claim for the consideration of landscape painting as a medium of decoration was that it could conform to give high purpose, and that it did conform to give just demands.

Mr. Solomon J. Solomon's Paper.
